NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage was shall be commenced on each multiply completed well within seven dars after across completion of the well, and annually thereafter as prescribed by the order surhorizing the multiple completion. Such term shall also be commenced on all order surhorizing making seven days following recompletions and/or chemical or fracture retainment, and whenever remedial work has been done on a well during which the packet or the rabing have been directled. Term shall also be taken at any nime that communication is suspected or when requested by the Division.

Commenced at Shour, dated * *

- At least 72 hours prior to the commencement of any packer leakage test, the operator shall norsely the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so socified.
- The packer lexisage test shall commence when both zones of the dual completion are shurt-in for previous stabilization, Both zones shall remain shurt-in small the well-head persoure in each has stabilized, provided however, that they need not remain short-in more than preven deep.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal case of production while the other zone remains short-in. Such sest shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Nose: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shot-in, in accordance with Paragraph 3 above.
- 6. Flow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Ten No. 1. Procedure for Flow Ten No. 2 is to be the same as for Flow Ten No. 1 except

- that the previously produced 2000 shall remain abus-in while the 2000 which was previously abot-in is produced.
- 7. Pressures for gas-tone term must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests; immediately prior to the beginning of each flow-period, at fafteen-minute intervals during the first hour thereof, and a hourly intervals thereafter, including one pressure ascaratement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the conclusion of each flow period, and intervals one time during each flow period (at approximately the midway point) and interediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 14-hour oil zone text: all pressures, throughout the entire text, shall be continuously accurred and recorded with recording pressure gauges the accuracy of which must be threshed at least rower, once at the legislating and once at the end of each rest, with deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as require above being taken on the gas sone.
- 8. The results of the above-described tests shall be filed in triplicate within 13 days aftercorpletion of the test. Tests shall be filed with the Acree Dorant Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form Revisition-18 with all desdweight pressures indicated thereon at well as the flows temperatures (gue soots only) and gravity and GOR (oil soots only).
