## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed well within seven days
  actual completion of the well, and animally thereafter as prescribed by the order authorizing the multiple completion. Such mass shall also be connected on all smitiple completions within seven days following recompletions and/or chemical or frac-ours sweetness, and whenever remarkal work has been pressure gauge at time supervise as follows: 3 hours mass; manufactly prior to the done on a well during which the packer or the sabing have been disturbed. Tests shall also be taken at mication is suspected or when requested by the Division. any time that que
- 2. At least 72 hours prior to the communication of any packer leakage test, the operator shall actify on in writing of the quant time the test is to be commerced. Offset operators shall also be so notified.
- The pactor leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. both zones shall remain shun-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For flow Test No. 1, one more of the dual completion shall be produced at the normal rate of production while the other some remains shut-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer insings test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Precedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- mond on each multiply completed well within street days after—except that the previously produced zone shall remain shalf in while the zone which was proviously shee-in is produced.
  - pressure gauge at time setervals as follows: 3 hours uses: ammediately prior to the beginning of each flow-period, at fifteen minus inservals during the first hour thereof, and at hourly intervals thereafter, including one pressure measure immediately prior to the flow period, at least one time during each flow period (at approximately the midwey point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells hich have proviously shown questionable test data.
  - 24-hour oil zone meses all pressures, throughout the entire test, shall be continuously manusured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a dandweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil most only, with dendweight pressures as required above being taken on the gaz zone.
  - 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azec District Office of the New Mexico Oil Comervacion Division of Northwest New Mexico Pacier Lenkage Test form Revised 10/01/78 with all deadweight pressures indicated thereou as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
