- NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and ansaulty thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or chemical or frac-ture treatment, and whenever remedial work has been done on a well during which the pacter or the tubing have been distarted. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- nce when both zones of the dual completion are shut-in for Inc passer rearrage cert statt consumine when our zenes or the cast compensor are susarm pressure stabilization. both zones shall remain shut-in until the well-head pressure in each has
- pressure stabilization, both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shar-in more than seven days.

 4. For flow Test No. 1, one zone of the dust completion shall be produced at the normal rate of production while the other zone remains shar-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall
- 5. Following completion of flow Test No. 1, the well shall again be shus-in, in accordance with
- Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1.

 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

e e e como como establica de la constantidad de l

- flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data:
- 24-hour oil zone tests: ail pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azteo District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
