## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Date

... A pacter leakage test shall be commenced on each multiply competed well within seven days after except that the previously produced zone shall remain shat-in while the zone which actual completion of the well, and amountly thereafter as prescribed by the order authorizing the mantiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or enemical or fine-ture treatment, and whenever remedial work has been come on a well during which the pactor or the tubing have been disturted. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

Title

- 2. At seast 72 hours prior to the commencement of any packer lealings test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The macter leakage test shall commence when both zones of the shall completion are shut-in for pressure stabilization, both zones shall remain shat-in until the well-head pressure in each has stabilized, provided however, that they need not remain shat-in more than seven days.
- 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shar-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial pacine lealage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall he Unros DOURS.
- 5. Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above
- 6. Flow Test No. 2 shall be conducted even though no loak was indicated during flow Test No. 1. Processure for Flow Test No. 2 is to be the same as for Flow Test No. 1

was previously shat-in is produced.

5/6/95

- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure sause at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the concrusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-ou or an oil-gas dual completion, the recording gauge shall be required on the oil zone onry, with deadweight pressures as required above being taken on the gaz zone.
- 8. The results of the above described tests shall be filled in triplicate within 15 days after completion of the test. Tests shall be filed with the Aziec District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Pacier Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zonce only).
