ATTENTION Mr. Emory Arnold

Dear Sir:

Enclosed is the 1954 deliverability test on Anderson-Prichard - Culpepper-Martin Well No. 1. This well was tested under severe weather conditions and due to line freeze-ups and meter freezes the chart during the actual flow period is not at all representative of the wells ability to produce. There was a period of several days during the last part of the chart period which was free of freeze-ups. We used the average of this period for a stabilized flow determination. We hope the departure from normal procedure in testing will meet with your approval.

Yours very truly,

L.W. McGlothlin
