The purpose of this study is to investigate the effect of the independent variable on the dependent variable. The study was conducted using a quantitative research design. The data was collected from a sample of participants who were selected through a random sampling method. The results of the study indicate that there is a significant positive relationship between the independent variable and the dependent variable. This finding is consistent with the previous research conducted in this area. The study has several limitations, including a small sample size and a lack of control over the environment. Future research should aim to address these limitations and further explore the relationship between the variables.
