Re: Closure Approval: LFS-9 Oil Pipeline Release  
Site Reference UL-M. Sec. 32 T-25S-R-37E  
Spill Date: March 30, 1998  
Closure Request Dated: June 6, 2003

Dear Mr. Springer,

The closure proposal submitted to the New Mexico Oil Conservation Division (OCD) by BNC Environmental Services, Inc. as agent for Shell Oil Products US (Formally d.b.a. Equilon Pipeline Co.) is **hereby approved**. Based on information provided, no further action is required at this time.

Please be advised that OCD approval does not relieve Shell Oil Products US (Formally d.b.a. Equilon Pipeline Co.) of liability should remaining contaminants pose a future threat to ground water, surface water, human health or the environment. Additionally, OCD approval does not relieve Shell Oil Products US (Formally d.b.a. Equilon Pipeline Co.) of responsibility for compliance with any other federal, state, or local laws and/or regulations.

If you have any questions or need assistance please feel free to call me (505) 393-6161, x111 or email [lwjohnson@state.nm.us](mailto:lwjohnson@state.nm.us).

Sincerely,

Larry Johnson - Environmental Engineer

## EXECUTIVE SUMMARY

---

This Soil Remediation and Closure Report has been prepared for Shell Oil Products US (SOPUS) and summarizes the results of remediation and closure activities conducted between November 12, 2002 and November 26, 2002 at the former Equilon Pipeline Company LFS-9 crude oil release site located at Jal Basin Station Tank Farm. The site is located west of Highway 18, approximately 2.5 miles south of Jal New Mexico. The legal description of the site is SW ¼ of SW ¼ of Section 32, Township 25 South, Range 37 East, Lea County, New Mexico. Site coordinates are Latitude 32° 04' 54"N, Longitude 103° 10' 33" W.

BNC Environmental Services, Inc. (BNC) conducted a comprehensive subsurface soil investigation at the referenced site in September 2001. Based on the findings and analytical results of laboratory analyzed soil samples obtained during soil assessment activities, horizontal and vertical delineation of crude oil-affected soils was determined and a "Subsurface Soil Assessment Report" was submitted to Larry Johnson of the New Mexico Oil Conservation Division (NMOCD), Hobbs New Mexico District Office on December 21, 2001.

Based on the findings of the soil assessment, BNC prepared and submitted for NMOCD approval a "Soil Remediation Workplan" dated August 6, 2002. In general, the remedial workplan proposed remedial activities designed to excavate and dispose of a maximum amount of hydrocarbon-affected soils (exhibiting soil concentrations of TPH and BTEX above NMOCD site remediation levels) as could feasibly be accomplished without disturbing the structural integrity of utility poles and other site features that presented safety issues relating to excavation activities. The workplan included removal of soils that demonstrated the ability to leach to groundwater based on Synthetic Precipitate Leaching Procedure (SPLP) analysis. Installation of a clay barrier layer was proposed in the workplan as a control measure designed to inhibit leaching processes that could potentially act on hydrocarbon-affected soils. The remedial workplan was approved by Larry Johnson, Environmental Engineer, of the NMOCD in an email letter dated August 22, 2002.

Remediation and closure activities were conducted between November 12, 2002 and November 26, 2002 in accordance with the NMOCD approved remedial workplan. Confirmation soil samples were collected from the remedial excavation bottom and sidewall areas prior to backfilling activities. Final laboratory results for all confirmation soil samples collected indicated that hydrocarbon-affected soils exhibiting TPH and BTEX concentrations above NMOCD site-specific remediation clean-up levels had been removed by excavation with the exception of one sample (PLN-8') located directly beneath the leak source at a depth of 8 feet below ground surface (bgs). Based on the reported TPH concentration, PLN-8' was further analyzed for SPLP analysis for TPH diesel range organics (DRO). The analytical results demonstrated a SPLP concentration below the method detection limits indicating residual TPH concentrations remaining at this location do not have the potential to leach to groundwater. Additionally, the PLN-8' location was identified in the approved workplan as an area where only shallow soil removal operations (two – three feet) could be performed due to safety reasons. An impervious clay barrier layer was installed within the remedial excavation prior to backfilling the excavation with clean sand. Ninety-one manifested truckloads transported 1888 tons of affected soils to the Lea Land, Inc. facility for disposition.

Based on the confirmation soil analytical results, no further remedial activities are planned for the site. BNC, on behalf of Shell Oil Products US, respectfully requests a "No Further Action" designation be granted from the NMOCD for the approved and completed remediation and closure activities.

## SECTION I

## PURPOSE AND ORGANIZATION OF REPORT

---

BNC Environmental Services, Inc. (BNC) prepared this Soil Assessment and Site Closure Report on behalf of Shell Oil Products US (SOPUS). The purpose of this report is to document remedial and closure activities at a crude oil pipeline release site that was identified on March 30, 1998 at the Equilon Pipeline Company Jal Basin Station Tank Farm in Lea County, New Mexico. The legal description of the Site is SW ¼ of SW ¼ of Section 32, Township 25 South, Range 37 East. Site coordinates are Latitude 32° 04' 54" N, Longitude 103° 10' 33" W. A soil remediation workplan prepared by BNC was submitted to and approved by the New Mexico Oil Conservation Division (NMOCD) prior to performing site work.

Regulatory Framework/Site Classification and Site Background are presented in Sections II and III, respectively. Subsequent sections summarize remedial activities in the general order of occurrence: Soil Excavation and Delineation, Confirmation Sampling and Analytical Results, Waste Disposal, Installation of Clay Barrier Layer and Site Restoration, Quality Assurance (QA) and Quality Control (QC) Procedures and Summary of Findings, and Site Closure Request.

A site locality map is presented on FIGURE 1. Site details before and after the soil remediation and site closure activities are illustrated on FIGURE 2 and FIGURE 3, respectively.

The analytical results of soil sampling activities are presented in TABLE I. The table presents analytical results of confirmation soil samples collected from the excavation floor and sidewalls and includes selected soil samples tested for total petroleum hydrocarbons (TPH) by the Synthetic Precipitate Leaching Procedure (SPLP).

The appendices contain supplementary project information including photographic documentation of remedial activities, NMOCD correspondence, laboratory analytical reports and soil waste disposal manifests.

## SECTION II

## REGULATORY FRAMEWORK AND SITE CLASSIFICATION

The NMOCD has regulatory jurisdiction over oil and gas production operations, including crude oil pipeline spills and associated closure activities in the State of New Mexico. This project was conducted under the regulatory guidance of the NMOCD, which requires that soil-affected by a crude oil spill be remediated in such a manner that the potential for future affects to groundwater or the environment are minimized. The NMOCD clean-up levels are determined on a site-by-site basis, and are based on ranking criteria, which is outlined in the NMOCD "Guidelines for Remediation of Spills, Leaks, and Releases", dated August 13, 1993. These ranking criteria guidelines are based on site characteristics consisting of: depth to groundwater, wellhead protection (useable water sources), and distance to surface water.

BNC engaged Banks Information Solutions, Inc. (BIS), to perform a search of available records indicating the location of water wells within a one-mile radius of the site. The water well search report indicated that one well owned by Olsen Oil Company is located approximately one-half mile northeast of the release site and was drilled to a total depth of 105 feet below ground surface (bgs). The report indicates that the well is "un-used" and did not provide depth to water information. However, depth to groundwater information at the site is available based on the location of approximately 17 environmental monitoring wells at the facility. The monitoring wells are associated with an unrelated historic diesel release at the tank farm site. Currently, SOPUS performs quarterly groundwater sampling activities on these wells. The reported depth to water in these wells range from 86 to 94 feet bgs.

The crude oil leak site is located within the confines of an active crude oil storage tank farm facility. The land surface within the area of the tank farm is relatively flat and covered by bermed tank pads, hardened caliche and asphalt roads. In general, adjacent properties are relatively flat with undulating drift sand deposits resulting in a low relief, hilly, sandy, and dry topography. Adjacent land use in the immediate area surrounding the tank farm is a combination of rangeland and oil leases, mostly vegetated by mesquite brush, cactus, and native range grass. Oil wells are present in the overall adjacent area. Surface water and wellhead protection areas are greater than 1,000 feet from the release site.

The table below illustrates the ranking criteria and scoring used by the NMOCD and includes site specific characteristics at the Jal Basin Station site.

Criteria	Site Characteristics	Ranking Score
Depth to Ground Water	50-99 feet	10
Wellhead Protection Area	>1000 feet	0
Distance to Surface Water	>1000 feet	0
	Total Ranking Score	10

Based on the Jal Basin Station Tank Farm site characteristics and the "Guidelines for Remediation of Spills, Leaks and Releases" the site has a ranking score of 10. Consequently the ranking criteria clean-up levels of 10 mg/kg Benzene, 50 mg/kg total BTEX, and 1,000 mg/kg TPH are established guidelines for remediation activities at the site.

Waste generated at this site is classified as non-exempt and subject to hazardous waste characterization. On March 28, 2001 and prior to the subsurface soil investigation, BNC collected a five-point composite soil sample (identified as SCC) from along the axis of the affected area. Results of the laboratory analysis indicated that no hazardous classification criteria were exceeded and that the submitted soil sample contained an approximate TPH concentration of 12,420 mg/kg (DRO+GRO).

Results of the laboratory analysis of soil sample SCC are summarized below. The analytical and quality control laboratory reports and chain-of-custody documentation are provided in the "Subsurface Soil Assessment Report" that was submitted to the NMOCD on December 21, 2001.

Sample ID	Date	Reactivity (Hydrogen Sulfide)	Reactivity (Hydrogen Cyanide)	Corrosivity (pH)	Ignitability	TCLP Mercury (Hg)	TPH DRO + GRO
SCC	3/28/01	<10 mg/kg	<2.5 mg/kg	7.73 s.u.	Non-ignitable	<0.010 mg/L	12,420.5 mg/kg

TCLP Metals	TCLP Semi volatiles	TCLP Volatiles
< laboratory detection limits	< laboratory detection limits	< laboratory detection limits

## SECTION III

## SITE BACKGROUND

---

The LFS-9 crude oil release site is located west of Highway 18, approximately 2.5 miles south of Jal in Lea County, New Mexico. The location of the project site is indicated on the Site Location Map, FIGURE 1.

A crude oil release was reported at the site on March 30, 1998. The volume of the release was reported to be an estimated 240 barrels with approximately 140 barrels recovered. The release was caused by internal corrosion of a 12-inch crude oil pipeline and affected a surface area of approximately 3,600 square feet. The flow of oil at the surface appears to have been to the north of the release point and was contained within a north to south trending shallow topographic trough. This trough area is bounded on the west by the rise of the adjacent tank berm and to the east by topographically higher sand build up along the eastern perimeter fencing. The sand deposition along the fence line was moderately vegetated. Underground pipelines, power lines, and a tank retention berm are present in the release area and overhead electric lines parallel the eastern boundary of the affected area. FIGURE 2 presents a site details map illustrating the crude oil pipeline, the release point, underground and overhead utilities, subsurface boring locations and other site features.

A crude oil release investigation for the LFS-9 site was performed during July 2000, by KEI Consultants, Inc. Reported results from this investigation indicated that the vertical extent of affected soil at the release site had not been delineated to the NMOCD closure standards. The report concluded that further investigation was necessary to delineate the vertical and lateral extent of affected soil at the site.

On September 10-11, 2001, BNC conducted a subsurface soil investigation at the referenced site. Fourteen soil borings were advanced to depths ranging from 4 to 22 feet bgs. The purpose of BNC's subsurface soil investigation was to perform a comprehensive soil investigation to assess the horizontal and vertical extent of the former crude oil release and obtain pertinent geological data to evaluate contaminant migration within the soil-to-groundwater pathway. Based on the analytical results of the subsurface soil investigation, vertical and horizontal delineation of the crude oil-affected soils was effectively determined. Hydrocarbon concentrations above NMOCD remediation levels were present in the soil to depths ranging from ground level to approximately 20 feet bgs. On December 21, 2002, BNC submitted a "Subsurface Soil Assessment Report" to the NMOCD, presenting the findings and results of the subsurface soil investigation.

Subsurface soil samples were subsequently collected on May 23, 2002 and submitted for laboratory analysis of TPH SPLP. The purpose of this analytical approach was to present scientific data that would aid in determining whether affected soils, if left in place, have the potential for leaching and ultimately affecting the groundwater. The analytical results and findings of the SPLP analysis was presented in a "Soil Remediation Workplan" dated August 5, 2002 and submitted to the NMOCD requesting State approval of the corrective actions outlined in the workplan.

The Soil Remediation Workplan proposed remedial activities designed to excavate and dispose of a maximum amount of hydrocarbon-affected soils (exhibiting soil concentrations of TPH and BTEX above NMOCD site remediation levels) as could feasibly be accomplished without disturbing the structural integrity of utility poles and other site features that presented safety issues relating to excavation of hydrocarbon-affected soils. The workplan provided for the removal of soils that demonstrated the ability to leach to groundwater based on TPH SPLP analysis. The installation of the clay barrier layer was proposed to the NMOCD as a control measure designed to inhibit leaching processes that could potentially act on residual hydrocarbon-affected soils left in place. The Soil Remediation Workplan was approved by the NMOCD in an email letter from Larry Johnson of the NMOCD, Hobbs District Office, dated August 22, 2002. A copy of this correspondence is included in APPENDIX B.

Remediation and closure activities were conducted at the site between November 12, 2002 and November 26, 2002 in accordance with the NMOCD approved Soil Remediation Workplan. In general, remedial and closure activities included the following activities:

- Obtaining written permission from the adjacent landowner to encroach the property east of the Tank Farm property for clean-up activities and using clean sand from this property for backfilling the proposed remedial investigation.
- Contracting Valor Telecom to re-route overhead and underground phone service lines, located within the proposed excavation area.
- Contracting Southwest Public Service (now Xcel Energy) to upgrade overhead electrical components to insure overhead electrical lines were structurally secure and supply a truck capable of holding utility poles secure during excavation activities.
- Coordinating the remediation/closure activities with SOPUS personnel and officials from the NMOCD.
- Maintaining site security by dismantling property fencing located at the north-east side of the property and within the remediation work area and re-installing the fence and access gates to outside of the excavation and soil remediation work area.
- Excavation and disposal of the maximum amount of hydrocarbon-affected soils (exhibiting soil concentrations of TPH and BTEX above NMOCD site remediation levels) as could feasibly be accomplished without disturbing the structural integrity of utility poles and other site features that presented safety issues related to excavation activities.
- Excavation of crude oil-affected soils that demonstrated the ability to leach to groundwater, based on SPLP analytical results documented in the Soil Remediation Workplan, dated August 5, 2002.
- Transporting, manifesting, and disposing of excavated crude oil-affected soils at a State approved facility.
- Confirmation sampling of soils from the bottom and sidewalls of the targeted excavation areas (as outlined in the remedial workplan) to confirm that hydrocarbon-affected soils exhibiting TPH and BTEX concentrations above NMOCD site remediation clean-up levels had been removed and supplying SPLP analytical data supporting that hydrocarbon-affected soils left in place would not leach to groundwater.
- Installation of an impervious clay barrier layer within the excavation areas as a control measure to inhibit leaching of residual hydrocarbon-affected soils. Backfilling and compaction of the excavated areas with clean soil.
- Restoring and grading the construction-affected areas and re-installing the property fencing.

## SECTION IV

## SOIL EXCAVATION AND DELINEATION

---

A Site-Specific Health and Safety Plan was developed prior to field mobilization and covered contingencies which could arise from working with crude oil-affected soil and heavy equipment operation. The BNC remediation construction manager implemented the Site-Specific Health and Safety Plan in the field prior to and during the remediation activities. The remediation construction manager or his designee monitored air emissions during excavation activities to assure the quality of air for worker safety. In addition, the plan included heavy equipment and excavation operations, heavy truck traffic operations and covered traffic awareness signage at the ingress/egress points. Tailgate safety meetings were conducted prior to the beginning of each workday and included job safety analysis for specific work items. A copy of the Site-Specific Health and Safety Plan and corresponding documentation are on file at the BNC Office in Midland, Texas and are available upon request.

Following approval of the workplan by the NMOCD, BNC initially contracted Valor Telecom (Valor) to re-route overhead and buried telephone service lines out of the remedial work area. After this activity was completed, BNC mobilized the necessary heavy equipment and labor crew to the site to perform remedial/closure activities. The chain-link fencing located along the east side of the tank farm property line (within the construction area) was temporarily removed. Temporary chain-link fencing was installed surrounding the perimeter of the work area and two swing gates were installed for ingress and egress to the work area. The gates were locked at the end of each workday for security purposes. An excavator was utilized to excavate the areas of hydrocarbon-affected soils that could safely be removed without disturbing the structural integrity of utility poles. During excavation activities, Southwestern Public Service (Xcel Energy) provided a two man crew and truck capable of holding power poles to maintain structural support of the power poles during excavation activities. A bulldozer and/or loader were used to excavate the upper three to four feet of affected soils located around power poles and under lower power lines in the vicinity of soil boring B3. Affected soil around the underground utilities was excavated by hand prior to heavy equipment excavation.

Excavation activities resulted in a deep excavation located in the northern one half of the crude oil-affected area and a shallower excavation located in the southern one-half of the crude oil-affected area. Final excavation limits for the north excavation measured approximately 120 feet by 40 feet by approximately 10 to 17 feet in depth. The final excavation limits for the south excavation measured approximately 120 feet by 30 feet by approximately 2 to 4 feet in depth. Additionally, an approximate 20 feet by 15 feet area located immediately under the pipeline at the leak source was excavated to a depth of approximately 8 feet in depth.

Field screening of soil samples was conducted to aid in determination of the vertical and lateral limits of the remedial excavations. Field screening of soil samples consisted of headspace analysis and qualitative evaluation using visual and olfactory observations. Headspace analysis consisted of placing the soil sample in a ziplock bag and waiting approximately 30 minutes to allow volatile organic compounds (VOCs) to collect in the headspace of the sealed bag. A photo ionization detector (PID) was then used for detection of VOCs trapped in the bag. When field screening indicated non-detectable concentrations of VOCs in native soils, discrete confirmation soil samples were obtained from the remedial excavation floor and sidewalls.

## SECTION V

## CONFIRMATION SAMPLING & ANALYTICAL RESULTS

---

### Confirmation Soil Sampling

Confirmation soil samples were collected on November 14 and 15, 2002. FIGURE 3 displays the north and south excavation areas and confirmation soil sample locations. Based on field screening results of soil samples BNC collected three grab soil samples from the west wall (WW), three grab soil samples from the east wall (EW), one grab soil sample from the north wall (NW) and three grab soil samples from the floor of the north excavation (NE) area. The wall samples were obtained from a depth ranging from six to eight feet bgs and the floor samples were obtained at depths ranging from ten to seventeen feet bgs. Four grab soil samples from the floor of the shallower southern excavation (SE) area were obtained at depths ranging from two feet bgs to four feet bgs and were spaced approximately 50 feet apart. These samples were identified as SE A through D. Two grab soil samples from the excavation area under the pipeline at the leak source were obtained at a depth of eight feet bgs and designated PLN-8' and PLS-8' (pipeline north and south).

Samples were collected using dedicated sampling tools for each location in the shallow southern excavation area and by obtaining soil samples off of the bucket of the excavator within the deeper northern excavation area. The soil collected from each sample location was split into two equal portions and placed in two separate containers. A ziplock bag was used for headspace evaluation of VOCs and the second portion was placed in a sterile glass container equipped with a Teflon-lined lid furnished by the testing laboratory.

Final confirmation soil samples were submitted for laboratory analysis of TPH by EPA Method 8015 GRO/DRO (modified) and BTEX by EPA Method 8021B. The sample exhibiting the highest TPH concentration was analyzed using the SPLP.

### Analytical Results

The analytical results of confirmation soil samples collected at the Jal Basin Station, LFS-9 crude oil release site on November 14 and 15, 2002 and site specific clean-up levels are presented in TABLE I.

In summary, the analytical results for the northern excavation walls and floor samples, the southern excavation floor samples, and the pipeline south 8' sample indicated BTEX and TPH concentrations below site-specific regulatory clean-up levels. The pipeline north PLN-8' sample collected at eight feet bgs under the pipeline at the leak source exhibited BTEX and TPH gasoline range organics (GRO) below regulatory clean-up levels, however the PLN-8' sample exhibited the highest total concentration of TPH at 2,106.3 mg/Kg with diesel range organics (DRO) in this sample contributing 2,090 mg/Kg of the total TPH concentration. This TPH concentration is above site-specific regulatory clean-up levels of 1,000 mg/Kg. For this reason, the laboratory was instructed to run SPLP analysis on this sample. SPLP analysis indicated that concentrations of TPH DRO that could potentially leach to groundwater is <5.0 mg/L.

## SECTION VI

## WASTE MANAGEMENT

As outlined in the Remedial Workplan dated August 6, 2002, analytical results of a waste characterization soil sample collected on March 28, 2001 were submitted to Lea Land, Inc. (Lea Land) a State of New Mexico approved disposal facility. The waste characterization was approved by Lea Land. The Lea Land facility is located approximately 30 miles northeast of Carlsbad, New Mexico on State Highway 62/180. The legal description for the facility is Section 22, Township 20 South, Range 32 east, Lea County, New Mexico. Lea Land's landfill facility is as a commercial non-hazardous solid waste landfill, with NMOCD permit number WM-1-035 and New Mexico Environmental Department facility number SWM-131401.

Excavated soils were stockpiled at a leveled area located east of the excavation areas. This area was leveled to a size sufficient for the ingress and egress of trucks entering and leaving the site. Excavated soils were loaded to the trucks using a front-end loader and excavator. A fleet of five to seven trucks from Lea Land was used to transport soils from the site. Eighteen-wheel trucks capable of hauling approximately 20 to 22 cubic yards and tandem dump trucks capable of hauling approximately 12 to 14 cubic yards of soil were used for transporting the excavated soils. The trucks were loaded by counting the number of buckets that the loader put in each truck. This process was refined after the first round of transport and final weighing of the loads at the landfill. Trucks were loaded at the site so as not to exceed weight limits imposed by DOT regulations. A waste manifest accompanied each load of soil to the landfill and the finalized weight in tons was recorded on each final copy of the manifest. Each waste manifest was signed in the field by a BNC construction manager acting as agent for SOPUS. Transport of soil began on November 11, 2002 and the last load was transported on November 19, 2002. Stockpiled soil was covered with plastic at the end of each working day.

A total of 91 manifested truck loads of soil was removed from the site. After soil transporting activities were completed, Lea Land reported that the finalized quantity of soils transported for disposition was 1,888 tons (estimated at 1,571 cubic yards). Copies of the final waste manifests are provided in APPENDIX D.

4/13

## SECTION VII

## INSTALLATION OF CLAY LAYER AND SITE RESTORATION

---

Upon receiving analytical results of confirmation soil samples, BNC contacted the NMOCD, Hobbs District Office for verbal notification of the analytical results and description of sampled locations. Based on the analytical results, quantity, and locations of the confirmation samples, BNC requested verbal permission to begin backfilling activities. Permission was granted by the NMOCD and backfilling activities began on November 19, 2002.

The remedial excavation was initially backfilled with clean sand from adjacent areas of the site. At approximately five feet bgs in the northern excavation and at the original depths of the southern excavation area (2-4 feet bgs), approximately 250 cubic yards (300 tons) of clay was used to place the impervious clay barrier layer within each excavated area. The clay was imported to the site from an approved barrow site and installed in 6 to 8 inch lifts. Each lift was hydrated using clean potable water transported by a local water transport truck and compacted using the tracks of a D6 bull dozer. Using a tilted blade and tracks of the dozer, the water was mixed into the dry clay until a thick consistent mud was formed. At this point another dry lift of clay was placed on top of the mud slurry and the dozer tracked in the dry clay, whereby compacting the underlying slurry. This process was performed on each of four distinct lifts resulting in an approximate two foot thick impervious clay barrier layer. The remainder of the excavation was backfilled using clean sand from adjacent areas of the site. The clean soil was mounded over the excavations and compacted using the on-site heavy equipment.

After backfilling activities and soil transport activities were completed, the offsite barrow areas used to obtain clean sand for backfilling and the overall construction affected work areas were graded using the bulldozer and dressed using the loader bucket to back-drag the area.

The temporary fencing and gates were taken down and the original fence line was restored using new fence posts, a mix of original and new fence mesh, and the original brackets and 3 strands of barbed wire were placed along the top of the fence. New fence posts were concreted in place, as were the original fence posts. The original fence posts and associated concrete bases were hauled off site by a local construction contractor.

**Soil Sampling Procedures**

Soil samples were obtained by personnel utilizing appropriate sampling tools and wearing clean, disposable gloves. Confirmation soil samples were collected using dedicated sampling tools or insured that samples obtained from the bucket of the excavator were not in contact with the metal sides or bottom of the bucket. The soil samples were placed in laboratory supplied sterile glass containers equipped with Teflon-lined lids. Sample containers were filled to capacity with soil to limit the amount of head-space present. The filled containers were labeled, placed on ice in an insulated cooler, and chilled to an approximate temperature of 40°F (4°C). The cooler was sealed for transportation to TraceAnalytical laboratory located in Lubbock, Texas. Proper chain-of-custody documentation was maintained throughout the sampling process.

**Laboratory Protocol**

The laboratory was responsible for proper QA/QC procedures. These procedures are on file at the laboratory.

Soil samples were analyzed for TPH DRO/GRO analysis by EPA Method 8015B Modified, BTEX analysis by EPA Method SW846-8021B, and SPLP analysis by EPA Method 1312. All samples were analyzed within the fourteen day holding time.

## SECTION IX

## SUMMARY OF FINDINGS AND SITE CLOSURE REQUEST

---

Analytical results from confirmation soil samples collected from the excavation bottom and sidewalls were compared to the NMOCD site-specific remediation clean-up levels. Final laboratory results for all remedial excavation confirmation soil samples collected indicated TPH DRO/GRO and BTEX concentrations were below the NMOCD site remediation clean-up levels with the exception of one sample location designated PLN-8', which reported the highest total TPH concentration (2,106.3 mg/kg). Due to safety issues and the presence of various utilities, the affected soil represented by PLN-8' sample location could not be safely excavated as presented in the NMOCD-approved remedial workplan for this project. Based on the reported TPH concentrations, PLN-8' was further analyzed by the SPLP by EPA Method 1312 for TPH DRO. The results of the SPLP TPH DRO analysis indicated a concentration below the method detection limits; therefore, based on the SPLP analysis, the residual TPH concentrations remaining at this location do not have the potential to leach to groundwater. Additionally, an impervious clay layer was installed within the excavated areas and above hydrocarbon-affected soils left in place to insure that hydrocarbon-affected soils left in place will not be subject to leaching processes.

Based on the implementation of the NMOCD-approved Soil Remediation Workplan and the analytical results from remedial confirmation soil samples, no further remedial activities are planned for the site. BNC, on behalf of SOPUS, respectfully requests a "No Further Action" designation be granted from the NMOCD for the approved and completed remediation and closure activities.

Re: Soil Remediation Approval Request, Shell Oil Pipeline Jal Tank Farm Site  
 Site Reference UL-G, Sec-32 T-25S R-37E  
 Equiva Letter Date: August 5, 2002

Dear Mr. Landreneau,

The Remediation Work Plan Proposal submitted to the New Mexico Oil Conservation Division by Equiva Services LLC for Shell Pipeline is **hereby approved** with the following conditions.

- 1) Specific safety work plan submittal addressing overhead power hazard protection.

An onsite inspection with Mr. Craig Eschberger on August 21, 2002 raises safety concerns regarding the overhead electric lines in the work area. One incoming line is within an estimated height < 15' of immediate ground level. Given the apparent age of the poles and the unstable soil conditions (sand) it will be difficult to remove the contaminated soil in any manner other than hand digging and hand shoring the walls to stay within OSHA regulations. Overhead power is too close & concentrated to allow conventional digging equipment to work. Temporarily re-routing the overhead lines or installation of additional poles outside the work area to raise the lines and install appropriate guy lines to insure pole stability should be evaluated. Temporarily disabling the power and removing the line and poles during work would be an alternative that would allow removal of more contamination faster in a safer manner.

- 2) 48 hour notification to OCD prior to all sampling events

Please be advised that OCD approval of this plan does not relieve Shell Pipeline liability should their operations fail to adequately investigate and remediate contaminants that threaten ground water, surface water, human health or the environment. Additionally, OCD approval does not relieve Shell Pipeline of responsibility for compliance with any other federal, state, or local laws and/or regulations.

If you have any questions or need assistance please feel free to call or e-mail me at (505) 393-6161, x111 or email lwjohnson@state.nm.us

Sincerely,

Larry Johnson - Environmental Engineer

11/19/2002

These results represent only the samples received in the laboratory. The Quality Control Report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed. Note: the RDL is equal to MQL for all organic analytes including TPH. The test results contained within this report meet all requirements of LAC 33:I unless otherwise noted.

This report consists of a total of 22 pages and shall not be reproduced except in its entirety including the chain of custody (COC), without written approval of TraceAnalysis, Inc.

Note: Samples will be disposed of 30 days from the report date unless the lab is contacted before the 30

days has past.

Enclosed are the Analytical Results and Quality Control Data Reports for the following samples submitted to Trace Analysis, Inc.

Sample	Description	Matrix	Date Taken	Time Taken	Date Received
213647	PLN 8'	Soil	11/14/02	10:50	11/15/02

These results represent only the samples received in the laboratory. The Quality Control Report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed. Note: the RDL is equal to MQL for all organic analytes including TPH. The test results contained within this report meet all requirements of LAC 33:I unless otherwise noted.

This report consists of a total of 3 pages and shall not be reproduced except in its entirety including the chain of custody (COC), without written approval of TraceAnalysis, Inc.

Note: Samples will be disposed of 30 days from the report date unless the lab is contacted before the 30 days has past.

Re: Soil Remediation and Closure Report  
Shell Oil Products US (Formerly d.b.a. Equilon Pipeline Company)  
LFS-9 Crude Oil Pipeline Release Site  
Jal Basin Station-Tank Farm  
Release Date of March 30, 1998  
Section 32, Township 25 South, Range 37 East  
Lea County, New Mexico

Dear Mr. Johnson,

Shell Oil Products US (SOPUS) has completed remedial activities at the above referenced site. SOPUS, formerly d.b.a. Equiva Services LLC, managed environmental projects for Equilon Pipeline Company. SOPUS respectfully submits the enclosed Soil Remediation and Closure Report for your review. The report summarizes remedial activities performed at the referenced site in November, 2002 and in accordance with the NMOCD approved remedial workplan. Based on the analytical results of confirmation soil samples collected from the remedial excavation(s), hydrocarbon affected soils have been removed from the site and further corrective actions as approved in the remedial workplan have been implemented. Therefore, SOPUS requests that the NMOCD grant "no further action" status for this site. Should you have any questions concerning this letter, please contact me at (713) 241-9979 or by email at krspringer@shellopus.com.

Sincerely,  
Shell Oil Products US

K. R. Springer,  
Senior Environmental Engineer
