MCA 273

Possible Casing leak/Injection Well API#30-025-23730

Justification and Background: Currently well is an injector, supporting production in the MCA unit. Bring well back in to regulatory compliance.

Objective and Overview: Isolate leak and return to injection.

- 1 wk. before RU. Bleed well down by back flowing well to battery. Or set a gas buster & tank.
- MI RU WSU, blow well down.
- NDWH, NUBOP. TOOH laying down injection tubing. MO, send in to be inspected, burnt out, blasted and recoated with TK-99.
- MI work string and tally, TIH with bit, collars and tubing to 4188'(Note: on 6/2011 was getting metal and hard scale, stop @ 4188')
- COOH with tubing, collars and bit, TIH with RBP, packer and tubing, set RBP @ 3966', pull up 1stand, set packer, RU pump truck and pressure test packer/RBP to 550 psi. If test pass RU pump truck to casing and pressure test casing/packer to 550 psi for 15 mins
- If test fails, CUH and isolate leak, get injection rate, notify engineer for possible change in job scope.
- If test passes, TIH retrieve RBP, COOH laying down tubing, packer and RB. MO work string. MI and tally injection tubing.
- TIH with packer, on/off tool and tubing and set @ +/- 3969'.
- RU pump truck and test casing/packer. If test passes, get off on/off tool, circulate packer fluid.
- RU chart on casing/packer test, 35 mins @ 550 psi. Notify NMOCD and BLM of impending test

Give chart to Production Tech. RD. Clean up location

Table 3 : Well Control Inform	nation		
Estimated H2S (ppm)	8000	Max anticipated MCFPD	10
100 ppm H2S ROE (ft)	21	Well Category	2
500 ppm H2S ROE (ft)	9.	BOP Class	2

Note: Poly lined tubing

Table 5 : Perforations

Perforations	Grayburg San Andres	4040'	4246'
Perforations			
Openhole			
PBD		4188'	
TD		4254'	

Well Service Procedure:

- 1. Verify the anchors have been tested prior to RU on well.
- 2. Review JSA prior to RU on well.
- 3. MI WSU RU. NDWH, NUBOP, TOOH laying down tubing, on/off tool and packer.
- 4. MO old injection tubing, MI and tally work string.
- 5. TIH with bit, collars and tubing to 4188' pressure test GIH. (Note: we had hard scale, metal, and rubber at this depth on last well service and stop). If fill is present, clean back out to 4188'.
- 6. COOH with tubing, collars and tubing. TIH with RBP, packer and tubing.
- 7. Set RBP @ +/- 3967'. Pull up 1 stand, set packer, RU pump truck to tubing and pressure test packer/RBP to 550 psi. If test passes go to step 8.

- 8. RU pump truck to casing and pressure test packer/casing to 550psi for 15 mins, if test fails, CUH and isolate leak. Get injection rate. Notify Production Engineer Michael Sendze for possible change in job scope.
- 9. If test passes, TIH retrieve RPB, COOH with workstring packer and RBP, lay all equipment down.
- 10. MO work string. MI and tally inspected yellow band TK-99 injection tubing from CTB pipe yard.
- 11. Note: if well has been flowing, and cannot be killed by circulating brine water go to step 12.
- 12. MI e-line services. RU and pressure test lubricator to a minimum of 3000 psi or 1000 psi above the highest observed surface pressure.
- 13. PU CCL tool and gauge ring and correlate to packer setting @ +/- 3969'. COOH and lay down CCL and gauge ring.
- 14. RIH with the following:
 - 1-23/8 on/off tool NP with 1.81" F-nipple with no go.
 - 1 2 3/8 X 4.5" NP Arrow set 1X packer
 - $1-2 \ 3/8 \ X \ 4'$ tubing sub.
 - 1 23/8 wireline guided (1.995")

NOTE: shop test packer-plug combination to 3000 psi or a minimum of 1000 psi above the highest observed surface pressure, prior to bring out to location.

- 15. Land and set bottom of packer assembly (a) +/-3969'. COOH
- 16. RD MO E-line services.

17. Monitor well bore pressure for 30 mins to confirm plug/packer are holding.

18. TIH with top section of on/off tool and new or inspected injection string, pressure test GIH.

19. Circulate packer fluid to surface (3969' X .0108 = 42.83bbls. total).

20. Latch onto on/off tool. RU pump truck to casing and pressure test casing/packer to 550 psi.

21. If casing/packer test passes, RU chart recorder with 1000 psi chart and pressure test casing/packer to 550 psi for 35 mins.

22. Note: need to notify the OCD and BLM of the impending test.

23. Give chart to Production Tech.

24. RD. Clean up location.

Conditions of Approval

ConocoPhillips Co. MCA Unit 273 API 30-025-23730

- Due to being within the Lesser Prairie Chicken habitat, this workover activity will be restricted to the hours of 9:00am through 3:00am for the period of March 1 through June 15. Exceptions to these restrictions may be granted by BLM's Johnny Chopp
- 2. Subject to like approval by the New Mexico Oil Conservation Division.
- 3. Notify BLM 575-393-3612 as work begins. Some procedures are to be witnessed. If there is no response leave a voice mail with the API#, workover purpose, and a call back phone number. Note the contact, time, & date in your subsequent report.
- 4. Before casing or a liner is added, replaced, or repaired prior BLM approval of the design is required. Use notice of intent Form 3160-5.
- 5. Surface disturbance beyond the existing pad shall have prior approval.
- 6. A closed loop system is required. The operator shall properly dispose of drilling/circulating contents at an authorized disposal site. Tanks are required for all operations, no excavated pits.
- 7. Functional H_2S monitoring equipment shall be on location.
- 8. All waste (i.e. trash, salts, chemicals, sewage, gray water, etc.) created as a result of work over operations shall be safely contained and disposed of properly at a waste disposal facility. No waste material or fluid shall be disposed of on the well location or surrounding area. Porto-johns and trash containers will be on-location during fracturing operations or any other crew-intensive operations.

Well with a Packer - Operations

- 1) Conduct a Mechanical Integrity Test of the tubing/casing annulus after a tubing, packer or casing seal is established.
- 2) The minimum test pressure should be 500 psig for 30 minutes or 300 psig for 60 minutes, with a minimum 200 psig differential between tubing and casing pressure (at test time) but no more than 70% of casing burst pressure as described by Onshore Order 2.III.B.1.h. (The tubing or reservoir pressure may need to be reduced). Verify all annular casing vents are plumbed to surface and those valves open to the surface during this pressure test. An alternate method for a BLM approved MIT is to have the fluid filled system open to atmospheric pressure and have a loss of less than five barrels in 30 days witnessed by a BLM authorized officer.
- 3) Document the pressure test on a one hour full rotation calibrated (within 6 months) recorder chart registering within 25 to 85 per cent of its full range. Greater than 10% pressure leakoff

will be viewed as a failed MIT. Less than 10% pressure leakoff will be evaluated site specifically and may restrict injection approval.

- Make arrangements 24 hours before the test for BLM to witness. In Lea County phone 575-393-3612. If no answer, leave a voice mail or email with the API#, workover purpose, and a call back phone number
- 5) Submit a subsequent Sundry Form 3160-5 relating the MIT activity. Include a copy of the recorded MIT pressure chart. List the name of the BLM witness, or the notified person and date of notification. NMOCD is to retain the original recorded MIT chart.
- 6) Use of tubing internal protection, tubing on/off equipment just above the packer, a profile nipple, and an in line tubing check valve below the packer or between the on/off tool and packer is a "Best Management Practice". The setting depths and descriptions of each are to be included in the subsequent sundry.

7) Submit the original subsequent sundry with three copies to BLM Carlsbad.

- 8) Compliance with a NMOCD Administrative Order is required, submit documentation of that authorization.
 - a) Approved injection pressure compliance is required.
 - b) If injection pressure exceeds the approved pressure you are required to reduce that pressure and notify the BLM within 24 hours.
 - c) When injection pressure is within 50 psig of the maximum pressure, install automation equipment that will prevent exceeding that maximum. Submit a subsequent report
 - (Sundry Form 3160-5) describing the installed automation equipment within 30 days.
- 9) Unexplained significant variations of rate or pressure to be reported within 5 days of notice.
- 10) The casing/tubing annulus is required to be monitored for communication with injection fluid or loss of casing integrity. A BLM inspector may request verification of a full annular fluid level at any time.
