The elevation of the derrick floor above sea level is 3574 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Because this well will no longer flow except by agitation we intend perforate a section from 7290 to 7230 and from 7330 to 7340 and attempt to develop more gas and oil. The present lower production zone (7412 to 7455) will be separated from the upper zone by means of a packer while testing. When placed back on production both zones will be produced from, providing the upper section proves favorable, if not production will continue from the present zone by use of a mechanical lift.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
