## PRODUCED WATER QUALITY DATA SEARCH

Data in the New Mexico Produced Water Quality Database v.2 was updated in 2016 for the first time in many years. Data should be used for general informational purposes only. The uncertainties in data collection procedures, analysis quality and specific sample sources make it unsuitable as basis for any significant business or policy decisions. Data was gathered from many sources and about 5400 distinct wells in NM are represented. **More data exists for most samples than is provided by the results screen; the downloadable spreadsheet contains more information including field, formation, sample source (where available), and latitude/longitude.**

Funding for the database was provided by the U.S. DOE, various New Mexico State agencies, NMT, and WRRI.

To whom it may concern:

Publicly available geologic and engineering data related to the proposed well have been thoroughly reviewed, and no evidence for open faults or any other hydrologic connection between the proposed Devonian injection zone and any underground sources of drinking water has been found. Please see the attached seismic risk assessment for additional information.

## GENERAL INFORMATION

Mike Breard Fed SWD 5 is located in the NW 1/4, section 17, T.21S, R.27E, about 3 miles north of Carlsbad, NM in the Permian Basin. San Mateo Stebbins Water Management, LLC proposes to dispose produced water within the Devonian Formation through an open hole from 12,460'-13,640' below ground surface. This report assesses any potential concerns relating to induced seismicity along deep penetrating Precambrian faults or the connection between the injection zone and known underground potable water sources.

## SEISMIC RISK ASSESSMENT

### *Historical Seismicity*

**Searching the USGS earthquake catalog resulted in no (0) earthquakes above a magnitude 2.5 within 6 miles (9.7 km) of the proposed deep disposal site since 1970 (Fig. 1).** The nearest earthquake occurred on August 14, 2024 about 7.2 miles (11.6 km) northwest of the proposed SWD site and had a magnitude of 2.5.

### *Basement Faults and Subsurface Conditions*

A structure contour map (Fig. 1) of the Precambrian basement shows the Mike Breard Fed SWD 5 is approximately 5.4 miles (8.6 km) from the nearest basement-rooted fault inferred by Horne et al (2021). **Information about known nearby faults based on GIS data from Horne et al. (2021) is listed in Table 1.**

Snee and Zoback (2018) state, “In the western part of Eddy County, New Mexico,  $S_{H\max}$  is ~north-south (consistent with the state of stress in the Rio Grande Rift; Zoback and Zoback, 1980) but rotates to ~east-northeast-west-southwest in southern Lea County, New Mexico and the northernmost parts of Culberson and Reeves counties, Texas.” **Around the Mike Breard Fed SWD 5 site, Snee and Zoback indicate a  $S_{H\max}$  direction of N035°E and an  $A_\phi$  of 0.52, indicating an extensional (normal) stress regime.**

### *Fault Slip Potential (FSP) Modeling*

Induced seismicity is a growing concern of deep SWD wells. Software developed by the Stanford Center for Induced and Triggered Seismicity allows for the probabilistic screening of deeply penetrating faults near the proposed injection zone (Walsh et al., 2016; Walsh et al., 2017). This software uses parameters such as stress orientations, fault strike/dip, injection rates, fault friction coefficients, etc. to estimate the potential for fault slip. Using the best available data as input parameters (Table 2) including the subject well injecting at the proposed maximum of 45,000 bbls/day and all other existing SWDs within a 6 mile radius injecting at their individual historical peak annual volume (4 total SWD wells), the Fault Slip Potential (FSP) models suggest an eleven (0.11) percent chance of slip on a nearby fault, inferred by Horne et al. (2021), through the year 2049 (Fig. 2; Table 1). **This model also suggests a pore pressure increase of 30 psi on the nearest publicly known fault (Fault 16; Fig. 3; Table 1) by the year 2049.** Geomechanical modeling shows that the primary fault of concern (fault 16) would need a pressure increase

EXHIBIT I

of 2177 psi to reach a 100% probability of slip on the fault. A 50% probability requires an increase of 249 psi which is 8x greater than the modeled increase of 30 psi (Fig. 3).

## GROUNDWATER SOURCES

Quaternary Alluvium acts as the principal aquifer used for potable ground water near the Mike Breard Fed SWD 5 location (Hendrickson and Jones, 1952). Nicholson and Clebsch (1961) state, "Potable ground water is not available below the Permian and Triassic unconformity but, because this boundary is not easily defined, the top of the Rustler anhydrite formation is regarded as the effective lower limit of 'potable' ground water." Around the Mike Breard Fed SWD 5, the top of the Rustler Formation lies at an estimated depth of 170' bgs.

## VERTICAL MIGRATION OF FLUIDS

Permeability barriers exist above (Woodford shale; 66 ft thick) and below (Simpson Group; 102 ft thick) the targeted Devonian injection zone (Plate 2, Comer et al., 1991; Fig. 8, Frenzel et al., 1988). Summing the estimated thicknesses of underlying formations found in isopach data presented in Ruppel (2009), the calculated top of the Precambrian basement is at a depth of approximately 14,670' in this area. Therefore, the injection zone lies approximately 1,030' above the Precambrian basement and approximately 12,290' below the previously stated lower limit of potable water at the top of the Rustler formation.

## CONCLUDING STATEMENTS

After examination of publicly available geologic and engineering data, there is no evidence of open faults or any other hydrologic connection between the disposal zone and any underground sources of drinking water.

is the Quaternary sandstone, gravel, and conglomerate at the surface. Deepest water well within a mile is 631'. No water data was reported in it. Deepest reported water bearing strata was 270'. Anhydrite and gypsum were reported from 275' to 581' in 30-015-01052 in E-17-21s-27e.

According to State Engineer Office (SEO) records (Exhibit G), four water wells are within a mile. Two of the four wells were found during August 14, 2024, and October 16 and 26, 2025 field inspections. C 03958 POD1 was sampled during the first visit. However, the solar panel and pump wiring had been removed by the time of the October 16 and 25, 2025 inspections. The well could not be sampled a second time. C 01330 is a rod-less and vaneless windmill. No underground source of drinking water is below the proposed disposal interval.

Formation tops are:

Quaternary = 0'  
Yates = 567'

Bell Canyon = 2,713'  
Bone Spring = 4,713'  
Wolfcamp = 8,797'

Morrow = 11,000'  
Woodford shale = 12,370'

Four water wells are within a 1-mile radius according to State Engineer records (Exhibit G). Two were found during 2024 and 2025 inspections. There will be more than two miles of vertical separation and shale, salt, and anhydrite intervals between the bottom of the only likely underground water source (Quaternary) and the top of the Devonian.

X. Gamma MWD log will be run from intermediate casing to TD. CBL/CCL log will be run as far as gravity will let it fall.

XI. Two water wells were found within a mile during three field inspections in 2024 and 2025. One was a partially dismantled windmill. The other, a solar powered water well, was sampled in 2024. Solar panel and pump wiring had been removed in 2025. The 2024 analysis is in Exhibit H.

XII. San Mateo Stebbins Management, LLC (Exhibit I) is not aware of any geologic or engineering data that may indicate the Devonian is in hydrologic connection with any underground sources of water. As of October 29, 2025, there were 159 active Devonian SWD wells and 6 active Devonian water injection wells in New Mexico.

XIII. A legal ad (Exhibit J) was published in the Carlsbad Current Argus October 9, 2025. Notice (this application) will be sent to the surface owner (BLM) and all operators, lessees, and unleased mineral interest owners within a mile who are required to receive notice (Exhibit K).
