

**STATE OF NEW MEXICO  
ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT  
OIL CONSERVATION DIVISION**

**APPLICATION OF OXY USA INC. FOR A  
CLOSED LOOP GAS CAPTURE INJECTION  
PILOT PROJECT, EDDY COUNTY, NEW  
MEXICO.**

**CASE NO. \_\_\_\_\_**

**APPLICATION**

OXY USA Inc. (“OXY” or “Applicant”) (OGRID No. 16696) through its undersigned attorneys, hereby files this application with the Oil Conservation Division for an order authorizing OXY to engage in a closed loop gas capture injection pilot project in the Bone Spring formation (“pilot project”). In support of this application, OXY states:

**PROJECT OVERVIEW**

1. OXY proposes to create a 800-acre, more or less, project area for this pilot project consisting of the W/2 W/2 of Sections 21, 28 and 35, and the E/2 of Section 35, Township 23 South, Range 31 East, NMPM, Eddy County, New Mexico. See **Exhibit A** at 7-8.
2. The proposed project area is part of a larger area referred to as the Sand Dunes area.
3. Within the proposed project area, OXY seeks authority to utilize the following producing wells to occasionally inject produced gas into the Bone Spring formation:

- The **Cal-Mon MDP1 “35” Federal #1H well** (API No. 30-015-44771) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 277 feet FNL and 1077 feet FWL (Unit D) in Section 35, and a bottom hole location 202 feet FSL and 464 feet FWL (Unit M) in Section 35.

- The **Cal-Mon MDP1 “35” Federal #2H well** (API No. 30-015-44772) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 277 feet FNL and 1112 feet FWL (Unit D) in Section 35, and a bottom hole location 187 feet FSL and 1248 feet FWL (Unit M) in Section 35.
- The **Cal-Mon “35” Federal #41H well** (API No. 30-015-43140) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 250 feet FNL and 710 feet FWL (Unit D) in Section 35, and a bottom hole location 193 feet FSL and 951 feet FWL (Unit M) in Section 35.
- The **Iridium MDP1 “28-21” Federal Com #21H well** (API No. 30-015-45074) [Ingle Wells; Bone Spring Pool (Pool Code 33740)], with a surface location 610 feet FSL and 648 feet FWL (Unit M) in Section 28, and a bottom hole location 24 feet FNL and 303 feet FWL (Unit D) in Section 21.
- The **Cal-Mon “35” Federal #175H well** (API No. 30-015-45524) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 110 feet FNL and 615 feet FEL (Unit A) in Section 35, and a bottom hole location 17 feet FSL and 824 feet FEL (Unit P) in Section 35.
- The **Cal-Mon MDP1 “35” Federal #4H well** (API No. 30-015-44774) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 120 feet FNL and 2624 feet FWL (Unit C) in Section 35, and a bottom hole location 191 feet FSL and 2180 feet FEL (Unit O) in Section 35.
- The **Cal-Mon MDP1 “35” Federal #5H well** (API No. 30-015-44775) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 110 feet

FNL and 890 feet FEL (Unit A) in Section 35, and a bottom hole location 200 feet FSL and 1068 feet FEL (Unit P) in Section 35.

4. Injection along the horizontal portion of the wellbores will be at the following approximate true vertical depths:

- The **Cal-Mon MDP1 “35” Federal #1H well**: between 10,028 feet and 10,098 feet.
- The **Cal-Mon MDP1 “35” Federal #2H well**: between 9,940 feet and 10,101 feet.
- The **Cal-Mon “35” Federal #41H well**: between 10,295 feet and 10,385 feet.
- The **Iridium MDP1 “28-21” Federal Com #21H well**: between 8,664 feet and 8688 feet.
- The **Cal-Mon “35” Federal #175H well**: between 10,549 feet and 10,973 feet.
- The **Cal-Mon MDP1 “35” Federal #4H well**: between 10,226 feet and 10,368 feet.
- The **Cal-Mon MDP1 “35” Federal #5H well**: between 10,012 feet and 10,147 feet.

5. A map depicting the pipeline that ties the wells proposed for the pilot project into the gathering system and the affected compressor station is included in the attached ***Exhibit A*** at 7-8.

#### **WELL DATA**

6. Information on the well data, including well diagrams and well construction, casing, tubing, packers, cement, perforations, and other details for each proposed injection well are included in the attached ***Exhibit A*** at 18-31.

7. The top of the Bone Spring formation in this area is at approximately 8,000 feet true vertical depth and extends down to the top of the Wolfcamp formation at approximately 11,600 feet true vertical depth. *See Exhibit A* at 74-75.

8. The current average surface pressures under normal operations for the proposed injection wells range from approximately 560 psi to 860 psi. *See Exhibit A* at 32. The maximum allowable surface pressure (MASP) for the wells in the pilot project will be 1,250 psi. *Id.*

9. OXY plans to monitor injection and operational parameters for the pilot project using an automated supervisory control and data acquisition (SCADA) system with pre-set alarms and automatic shut-in safety valves that will prevent injection pressures from exceeding the MASP. *See Exhibit A* at 33, 49-50.

10. The proposed maximum allowable surface pressure will not exert pressure at the top perforation in the wellbore of any injection well with a full fluid column of reservoir brine water in excess of 90% of the burst pressure for the production casing or production liner. *See Exhibit A* at 32. In addition, the proposed maximum allowable surface pressure will not exert pressure at the topmost perforation in excess of 90% of the formation parting pressure. *See Exhibit A* at 32.

11. Cement bond logs<sup>1</sup> for each of the injection wells demonstrate the placement of cement in the wells proposed for this pilot project and that there is a good and sufficient cement bond with the production casing and the tie-in of the production casing with the next prior casing in each well.

12. The wells proposed for injection in the pilot project have previously demonstrated mechanical integrity. *See Exhibit A* at 34. OXY will undertake new tests to demonstrate

---

<sup>1</sup> Electronic version of the cement bond logs will be submitted to the Division by email.

mechanical integrity for each of the wells proposed for this pilot project as a condition of approval prior to commencing injection operations.

### **GEOLOGY AND RESERVOIR**

13. Data and a geologic analysis confirming that the Bone Spring formation is suitable for the proposed pilot project is included in ***Exhibit A*** at 71-78. A general characterization of the geology of the Bone Spring formation and its suitability for the proposed injection, including identification of confining layers and their ability to prevent vertical movement of the injected gas is included in the analysis. *Id.*

14. Zones that are productive of oil and gas are located in the overlying Brushy Canyon formation, and the deeper Wolfcamp Formation. *See Exhibit A* at 71.

15. Reservoir modeling indicates anticipated horizontal movement of injected gas will be approximately 100 feet or less from each injection wellbore within the Bone Spring formation. *See Exhibit A* at 85.

16. The proposed average injection rate is 1.8 MMSCFPD with a maximum injection rate of 2.0 MMSCFPD during injection for each well except the Iridium MDP1 “28-21” Federal Com #21H well, which has a proposed maximum injection rate of 3.0 MMSCFPD. *See Exhibit A* at 32.

17. OXY has prepared calculations estimating the stimulated reservoir volume based on supporting empirical data and a reservoir model to evaluate potential effects on wells adjacent to the pilot project area. *See Exhibit A* at 80-89. OXY’s analysis concludes that there will be no change in the oil recovery from each of its proposed injection wells or from any of the offsetting wells. *See id.* at 87.

18. Similarly, OXY has prepared an analysis of the potential effects on the reservoir caused by the proposed injection, including consideration of commingling fluids. ***Exhibit A*** at 80-89. OXY's analysis concludes that there will be no adverse effect on the reservoir as a result of the injection. *Id.* at 87, 90.

19. OXY has also prepared an analysis evaluating the expected gas storage capacity for the proposed injection well relative to the gas injection volumes for an injection scenario lasting twenty days. *See Exhibit A* at 88. The analysis confirms that whether the capacity is estimated based on the fracture volume gas equivalent or the total gas equivalent volumes produced from the proposed injection zone, the anticipated gas injection volumes will be well below the estimated volume capacity within the project area.

20. The source of gas for injection will be from OXY's wells producing in the Bone Spring and Wolfcamp formations that are identified in the list of wells in ***Exhibit A*** at page 36-38. Each of OXY's proposed injection wells are operated by OXY and OXY holds 100% of the working interest in the CLGC wells.

21. OXY has prepared an analysis of the composition of the source gas for injection and a corrosion prevention plan. *See Exhibit A* at 39-47.

22. OXY has examined the available geologic and engineering data and found no evidence of open faults or other hydrologic connections between the injection zone and any underground source of drinking water. *See Exhibit A* at 78. OXY has also examined the available geologic and engineering data and determined that the total recoverable volume of hydrocarbons from the reservoir will not be adversely affected by the pilot project. *See Exhibit A* at 90.

## **AREA OF REVIEW**

23. OXY has prepared maps depicting the surface hole location and trajectory of the proposed injection well, the location of every well within a two-mile radius, leases within two miles, and the half-mile area of review. *See Exhibit A* at 52-56.

24. A tabulation of data for wells that penetrate the proposed injection intervals or the confining layer within the area of review is included in *Exhibit A* at pages 57-60, along with wellbore schematics for wells that are plugged and abandoned or temporarily abandoned. *See Exhibit A* at 61-69.

## **OPERATIONS AND SAFETY**

25. OXY will monitor each injection well's instantaneous rates and daily injection volumes, along with pressure in the well tubing, casing, and bradenheads using an automated supervisory control and data acquisition (SCADA) system. *See Exhibit A* at 49-50. Each injection well will also include automated safety devices, including automatic shut-in valves among other operational safety measures. *See Exhibit A* at 33. OXY will also monitor and track various operational parameters at the pilot project's central tank battery and central gas lift compressors. *See id.*

26. A copy of this application will be provided by certified mail to the surface owner on which each injection well identified herein is located, and to each leasehold operator and other affected persons within any tract wholly or partially contained within one-half mile of the completed interval of the wellbore for each of the proposed injection wells. A copy of the affected parties subject to notice is included in *Exhibit A* at 95-96, along with a map and list identifying each tract and affected persons given notice. *See Exhibit A* at 92-94.

27. Approval of this pilot project is in the best interests of conservation, the prevention of waste, and the protection of correlative rights.

WHEREFORE, OXY USA Inc. requests that this Application be set for hearing before an Examiner of the Oil Conservation Division on September 9, 2021, and that after notice and hearing this Application be approved.

Respectfully submitted,

HOLLAND & HART LLP

ATTORNEYS FOR OXY USA INC.

CASE \_\_\_\_\_:

**Application of OXY USA Inc. for Closed Loop Gas Capture Injection Pilot Project, Eddy County, New Mexico.** Applicant in the above-styled cause seeks an order authorizing it to engage in a closed loop gas capture injection pilot project ("pilot project") in the Bone Spring formation, within a 800-acre, more or less, project area for this pilot project consisting of the W/2 W/2 of Sections 21, 28, and 35, and the E/2 of Section 35, Township 23 South, Range 31 East, NMPM, Eddy County, New Mexico, by occasionally injecting into the following wells:

- The **Cal-Mon MDP1 "35" Federal #1H well** (API No. 30-015-44771) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 277 feet FNL and 1077 feet FWL (Unit D) in Section 35, and a bottom hole location 202 feet FSL and 464 feet FWL (Unit M) in Section 35.
- The **Cal-Mon MDP1 "35" Federal #2H well** (API No. 30-015-44772) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 277 feet FNL and 1112 feet FWL (Unit D) in Section 35, and a bottom hole location 187 feet FSL and 1248 feet FWL (Unit M) in Section 35.
- The **Cal-Mon "35" Federal #41H well** (API No. 30-015-43140) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 250 feet FNL and 710 feet FWL (Unit D) in Section 35, and a bottom hole location 193 feet FSL and 951 feet FWL (Unit M) in Section 35.
- The **Iridium MDP1 "28-21" Federal Com #21H well** (API No. 30-015-45074) [Ingle Wells; Bone Spring Pool (Pool Code 33740)], with a surface location 610 feet FSL and 648 feet FWL (Unit M) in Section 28, and a bottom hole location 24 feet FNL and 303 feet FWL (Unit D) in Section 21.
- The **Cal-Mon "35" Federal #175H well** (API No. 30-015-45524) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 110 feet FNL and 615 feet FEL (Unit A) in Section 35, and a bottom hole location 17 feet FSL and 824 feet FEL (Unit P) in Section 35.
- The **Cal-Mon MDP1 "35" Federal #4H well** (API No. 30-015-44774) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 120 feet FNL and 2624 feet FWL (Unit C) in Section 35, and a bottom hole location 191 feet FSL and 2180 feet FEL (Unit O) in Section 35.
- The **Cal-Mon MDP1 "35" Federal #5H well** (API No. 30-015-44775) [Cotton Draw; Bone Spring Pool (Pool Code 13367)], with a surface location 110 feet FNL and 890 feet FEL (Unit A) in Section 35, and a bottom hole location 200 feet FSL and 1068 feet FEL (Unit P) in Section 35.

OXY seeks authority to utilize these producing wells to occasionally inject produced gas into the Bone Spring formation at true vertical

depths of between approximately 8,000 feet to 11,600 feet along the horizontal portion of each wellbore at surface injection pressures of no more than 1,250 psi. The source of the produced gas will be the Bone Spring and Wolfcamp formations. The subject acreage is located approximately 17 miles east of Loving, New Mexico.

# New Mexico Closed Loop Gas Capture (CLGC) Oxy- North Corridor

## EXHIBIT A

Occidental

# Overview

## General Project Description: Closed Loop Gas Capture Project Oxy- North Corridor

### About North Corridor

The North Corridor is a project area composed of Iridium and Calmon wells. These wells share the same source gas wells and the same gas system.

### Summary of Requested Relief

1. Authority to operate a Closed Loop Gas Capture Project ("CLGC") consisting of seven wells to prevent waste and reduce adverse impacts from temporary interruptions of gas pipeline capacity.
2. A 2-year duration of such authority with renewal by administrative approval.
3. Authority to, when applicable, place packers in CLGC wells as deep as possible but no more than 100 feet above the top of the injection zone.
4. Authority to add CLGC wells to the proposed project by administrative approval if the well is within the Area of Review previously completed.

### Overview

Oxy USA Inc. (Oxy) is proposing a CLGC project in the North Corridor area. On occasion, third-party gas purchasers reduce takeaway capacity and cause interruptions that result in flaring or shut in production. During these interruptions, Oxy will utilize CLGC wells to capture gas and reduce flaring.

In 2020, Oxy experienced 58 days of interruptions where the third-party gas purchaser temporarily reduced takeaway capacity from this location, resulting in the flaring of 162 MMSCF of gas or the immediate shut-in of at least 21,000 BOPD. Approval of this application will significantly reduce such flaring or shut-in production in the future.

Operations During Interruption	Operations During Interruption With CLGC System	Benefits
<ul style="list-style-type: none"> <li>Flare gas</li> <li>Shut in production</li> </ul>	<ul style="list-style-type: none"> <li>Store gas</li> <li>Continue production</li> <li>No additional surface disturbances</li> </ul>	<ul style="list-style-type: none"> <li>Reduce greenhouse gas emissions</li> <li>Improve economic recovery of mineral resources including gas that might have been flared</li> <li>Utilize existing infrastructure</li> </ul>

### Proposed Operations

Oxy has an extensive high-pressure gas system in the North Corridor area. It is used for gas lift, a type of artificial lift. Oxy plans to utilize the same system for gas storage operations. Very minimal equipment on surface will need to be installed prior to starting storage operations.

Enterprise is the third-party gas purchaser for the North Corridor area. If an interruption occurs, Oxy will divert gas from the takeaway line back into the gas lift injection system. Gas will flow from the Central

Gas Lift (CGL) Station through the flow meter, control valve, safety shutdown valve, wellhead and into the wellbore for storage. Gas will be injected down the casing/tubing annulus in all wells.

Simultaneously, the CLGC well will be shut in by closing the electric choke upstream of the production flowline. After the interruption has ended, the electric choke will open and the CLGC well resumes production.

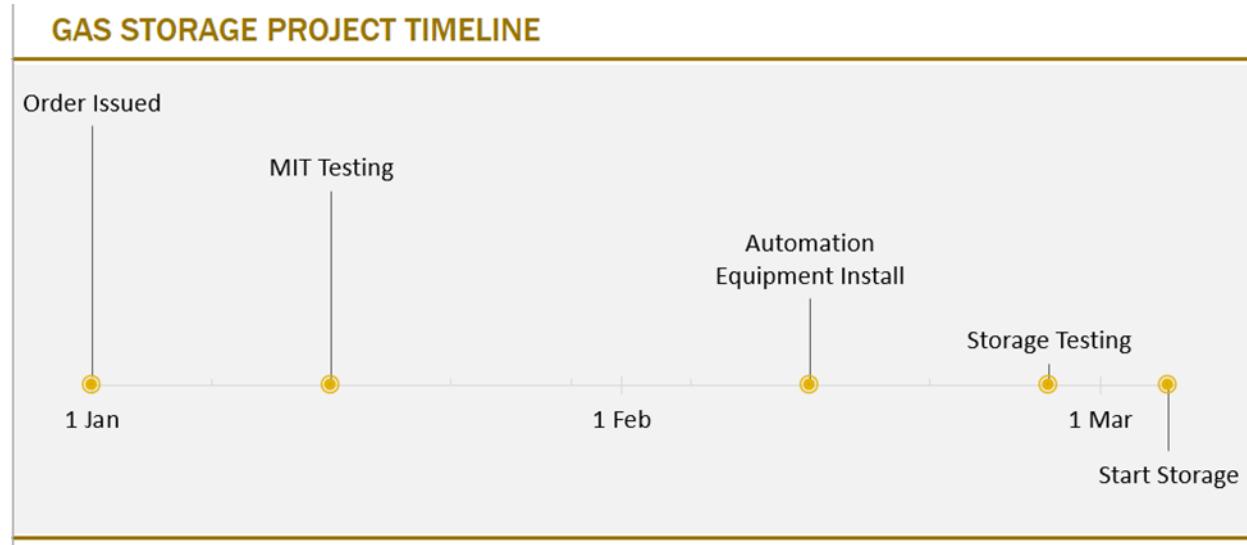

### Wells

7 wells are proposed in this application.

#	API 14	Well Name	Injection down the...
1	30015455240000	CAL-MON-175H	Casing
2	30015447710000	CALMON-35-1H	Casing
3	30015447720000	CALMON-35-2H	Casing
4	30015447740000	CALMON-35-4H	Casing
5	30015447750000	CALMON-35-5H	Casing
6	30015431400200	CAL-MON41HST	Casing
7	30015450740000	IRI28-21-21H	Casing

### Timeline

Since no new surface disturbances are required, this project can be implemented with minimal facility modifications. The timeline below assumes an order is issued on January 1 for illustration purposes.

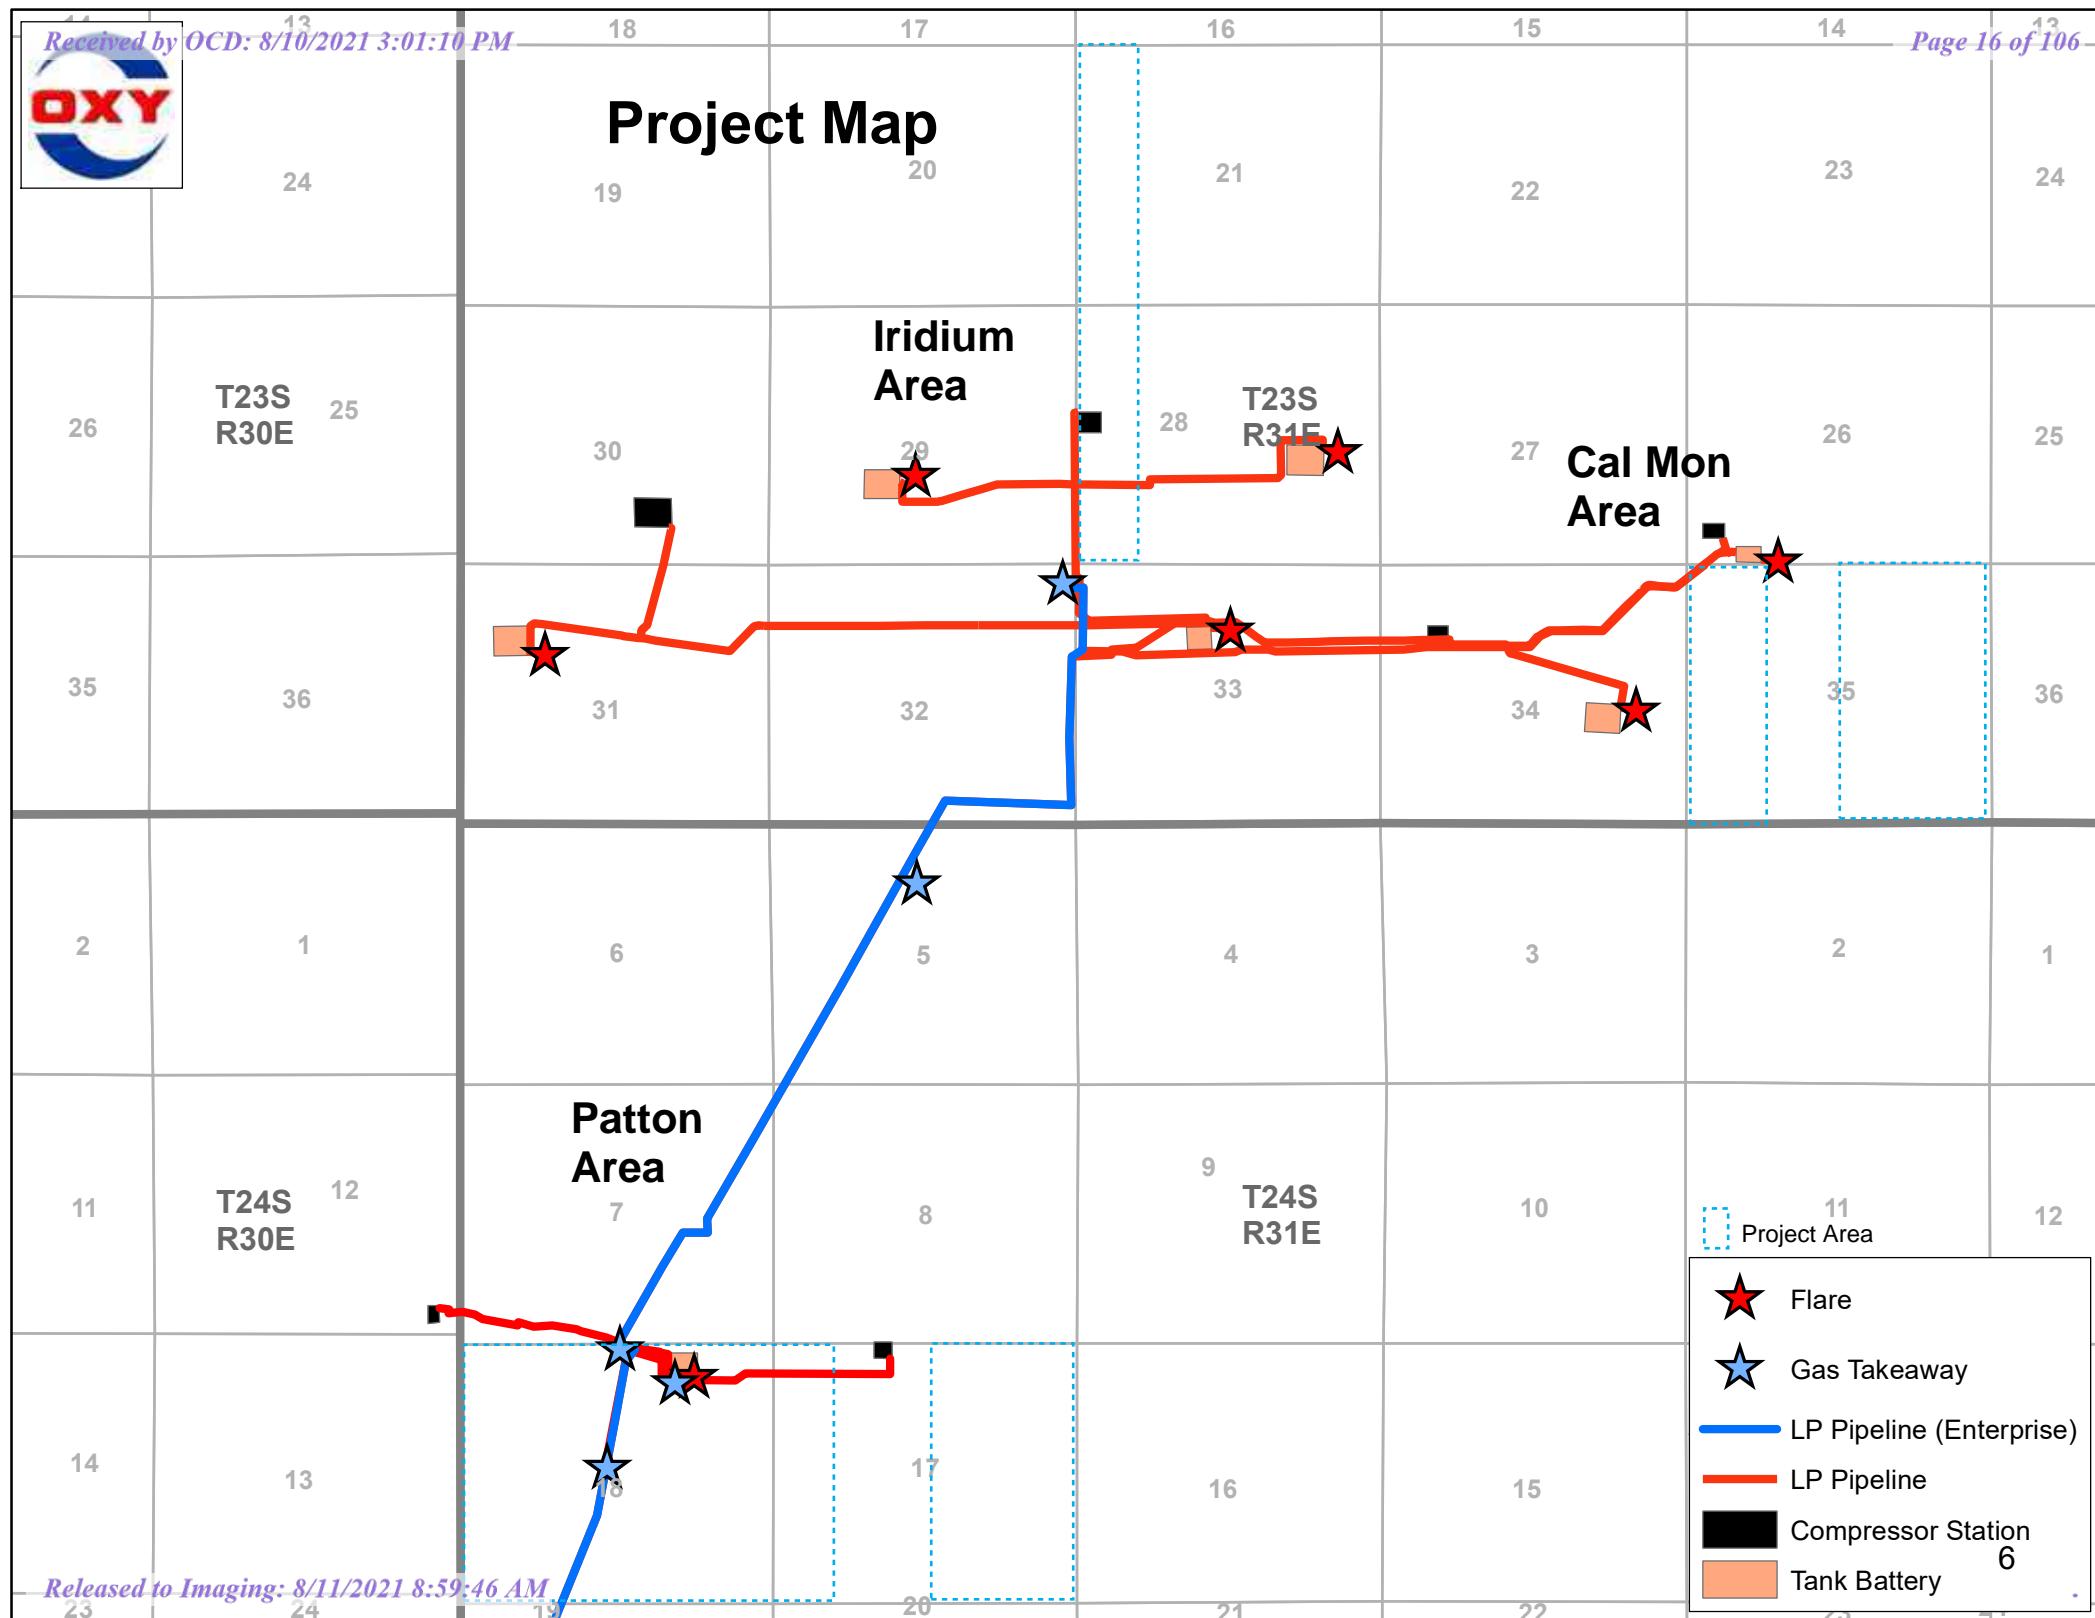

### Pertinent Details

- Maximum Allowable Surface Pressure = 1250 psi
- 7 horizontal wells
- Roughly 5000 ft and 10000 ft lateral lengths
- Injection down the casing/tubing annulus

- Target Formations = Avalon, Second Bone Spring, Harkey
- Top of injection zone based off perf TVD = 8664 ft TVD
- Bottom of injection zone based off perf TVD = 10973 ft TVD

Hole Size: 17.5" Casing Size: 13-3/8"

Cemented with: 804 sx. or \_\_\_\_\_ ft<sup>3</sup>

Top of Cement: SURFACE Method Determined: CIRC

Intermediate Casing

Hole Size: 12.25" Casing Size: 9-5/8"

Cemented with: 1245 sx. or \_\_\_\_\_ ft<sup>3</sup>

Top of Cement: SURFACE Method Determined: CIRC

Production Casing

Hole Size: 8.5" Casing Size: 5.5"

Cemented with: 2225 sx. or \_\_\_\_\_ ft<sup>3</sup>

Top of Cement: 518' Method Determined: CBL

Total Depth: 15,109' MD/10,366' TVD

Injection Interval

10,344' MD/10,226' TVD feet to 14,942' MD/10,368' TVD

(Perforated or Open Hole; indicate which)

Side 2

PERFTubing Size: 2-7/8" Lining Material: \_\_\_\_\_Type of Packer: WATSON AS1X 10K PACKER 20-23# 5.5"Packer Setting Depth: 10,038' MD/9991 TVD

Other Type of Tubing/Casing Seal (if applicable): \_\_\_\_\_

Additional Data

1. Is this a new well drilled for injection? \_\_\_\_\_ Yes  No

If no, for what purpose was the well originally drilled? \_\_\_\_\_  
**PRODUCER-OIL**

2. Name of the Injection Formation: \_\_\_\_\_

3. Name of Field or Pool (if applicable): [13367] COTTON DRAW; BONE SPRING

4. Has the well ever been perforated in any other zone(s)? List all such perforated intervals and give plugging detail, i.e. sacks of cement or plug(s) used. \_\_\_\_\_  
**NO**

5. Give the name and depths of any oil or gas zones underlying or overlying the proposed injection zone in this area: \_\_\_\_\_

## North Corridor Gas Analysis Summary

- All producing wells flow to the following Central Tank Batteries (CTB).
  - Gold CTB
  - Iridium CTB
  - Silver CTB
  - Precious CTB
  - Platinum CTB
  - Calmon CTB
- Gas flows into the low-pressure gas pipeline to the following Compressor Gas Lift Stations (CGL's).
  - Boo CGL Station
  - North Corridor 28 West CGL Station
  - North Corridor East CGL Station
  - Calmon CGL Station
- The CGL's combine downstream in the same gas lift line to feed wells collectively.
- Gas analysis is provided for:
  - Boo CGL Station
  - North Corridor 28 West CGL Station
  - North Corridor East CGL Station
  - Cal Mon Gas Lift Meter
  - Avalon production
  - 2<sup>nd</sup> Bone Spring production
  - Harkey production

Boo CGL

# Corrosion Prevention Plan

## Existing Corrosion Prevention Plan

- Produced gas is processed through a gas dehydration unit to remove water.
- Corrosion inhibitor is added to the system downstream of the gas dehydration unit.
- Fluid samples are taken regularly and checked for Fe, Mn, and residual corrosion inhibitor in produced fluids.
- Continuously monitor and adjust the chemical treatment over the life of the well.

**Oxy will continue the existing corrosion prevention plan in place for the gas lift system due to the similar nature of gas storage operations.**

- Fluid samples will be taken prior to injection to establish a baseline for analysis.
- After a storage event, fluid samples will be taken to check for Fe, Mn, and residual corrosion inhibitor in the produced fluids.
- Continuously monitor and adjust the chemical treatment over the life of the project.

# NM GAS STORAGE OPERATIONAL PLAN

# Operational Plan

## WELLSITE CLGC

Oxy USA Inc. (Oxy) will monitor the following items on each Closed Loop Gas Capture (CLGC) well via SCADA system:

- Injection flow rate and volume
  - Instantaneous Rate
  - Total Injected by Day (volume)
- Tubing Pressure
- Casing Pressure
- Bradenhead Pressures
- Safety devices
  - Pressure kills have an automated kill sequence that is initiated by SCADA system readings.
  - Injection pressure kills on production stream for injection
  - Relief Valves for both production and gas storage/injection streams to prevent overpressure (not monitored via SCADA other than pressure trend)
  - Control of injection rate and pressures via control valve at each well injection stream
  - Control of production stream via automated choke valves to ensure controlled production and prevent over pressurization of flowline

## CENTRAL TANK BATTERY (CTB)

Oxy will monitor the following items at each CTB via SCADA system:

- Production Rates
  - Oil
  - Gas
  - Water
- Safety devices
  - Flares at CTBs
  - Injection pressure kills on production/gas storage stream for injection
  - Emergency Shutdown (ESD) of wells that are local and remote for automatic shut downs to safe the system
  - Control of injection rate and pressures via control valve at each well injection stream

## CENTRAL GAS LIFT (CGL) COMPRESSOR(S)

Oxy will monitor the following items on each Central Gas Lift (CGL) Compressor Station via SCADA system:

- Safety devices
  - Discharge/injection pressure kills of each compressor and for the station
  - Relief Valves on 3<sup>rd</sup> stage of compressors, to prevent over pressurization (not monitored via SCADA other than pressure trend)
  - Station recycle valves (that recycle discharge pressure back to suction) if the pressure is getting too high for the compressor or station. (not all control valves are capable of

remote monitoring of valve position; but still monitored in some sense of the pressure trend for the station)

## SUPERVISORY CONTROL AND DATA ACQUISITION (SCADA)

Oxy SCADA system consists of PLCs at each CTB, Wellsite, and Central Gas Lift compressor or station.

- The Programmable Logic Controller (PLCs) will take action immediately (within seconds or minutes) as programmed to automatically safe the system as required; for the system and certain device shut down(s).
- The High Alarms and High-High Alarms will be logged and registered in the SCADA system. Also the call center will take the High Alarm and make the physical phone call notification to the production techs to acknowledge the alarm & take action.

## ENVIRONMENTAL/SPILL RESPONSE

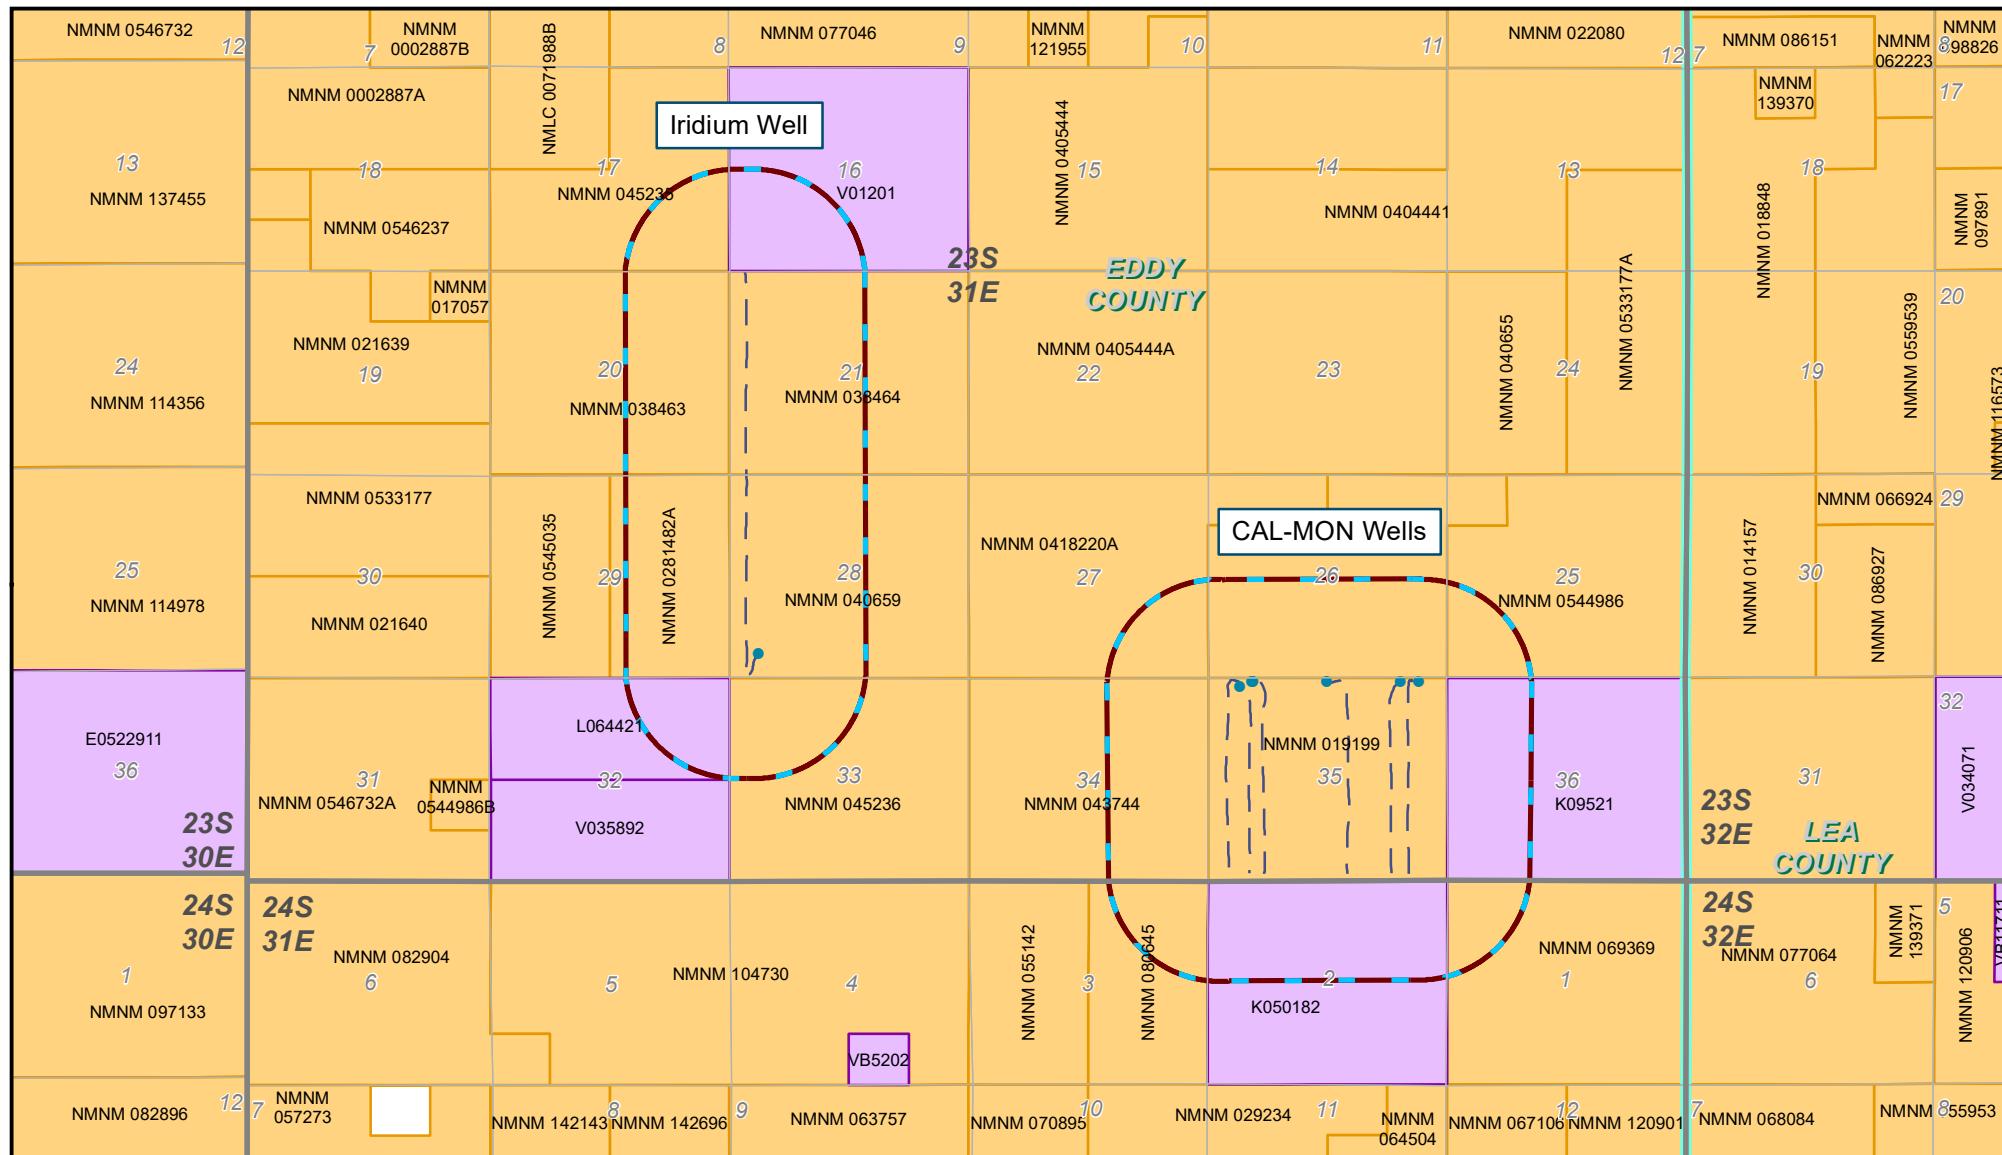

Oxy will report and track any spill recordable or non-recordable via our CDR system

- Any spill or gas release will be reported by operations calling in to our Call Center to make the report of spill/release. The fluid type and release amount will be disclosed along with location details; and if it's a recordable or non-recordable spill.
- Liquids will be contained and isolated and vacuum trucks will be called in to recover the liquid and will also report the amount of liquid recovered on the same CDR spill form.
  - Additional reclamation will be coordinated to ensure proper recovery of contaminated soil and liquid.

# Geology

# North Corridor Type Log

## Barriers protecting fresh water

- Rustler
- Salado Salt (~2,000ft thick)
- Castile Formation (~1,400ft thick)
  - > Low permeability anhydrite, gypsum, and calcite
- Delaware Mountain Group (~3,900ft thick)
  - > Low porosity/ low permeability sands

## Bone Spring and Wolfcamp Reservoir Characteristics

- Composed of large-scale cycles of alternating carbonate and siliciclastic-dominated successions
- Siliciclastic members are low stand turbidite channel, fans & distal sheets
  - > Very fine-grained sandstones and silts, mudstones, and shales
  - > Porosity 4-9% Permeability 400-800nD
  - > Authigenic clays are present
- Carbonate members are high stand submarine debris flows & sheets and act as internal barriers to flow between the different sandstone members

## Immediate barriers to flow outside of Bone Spring/ Wolfcamp

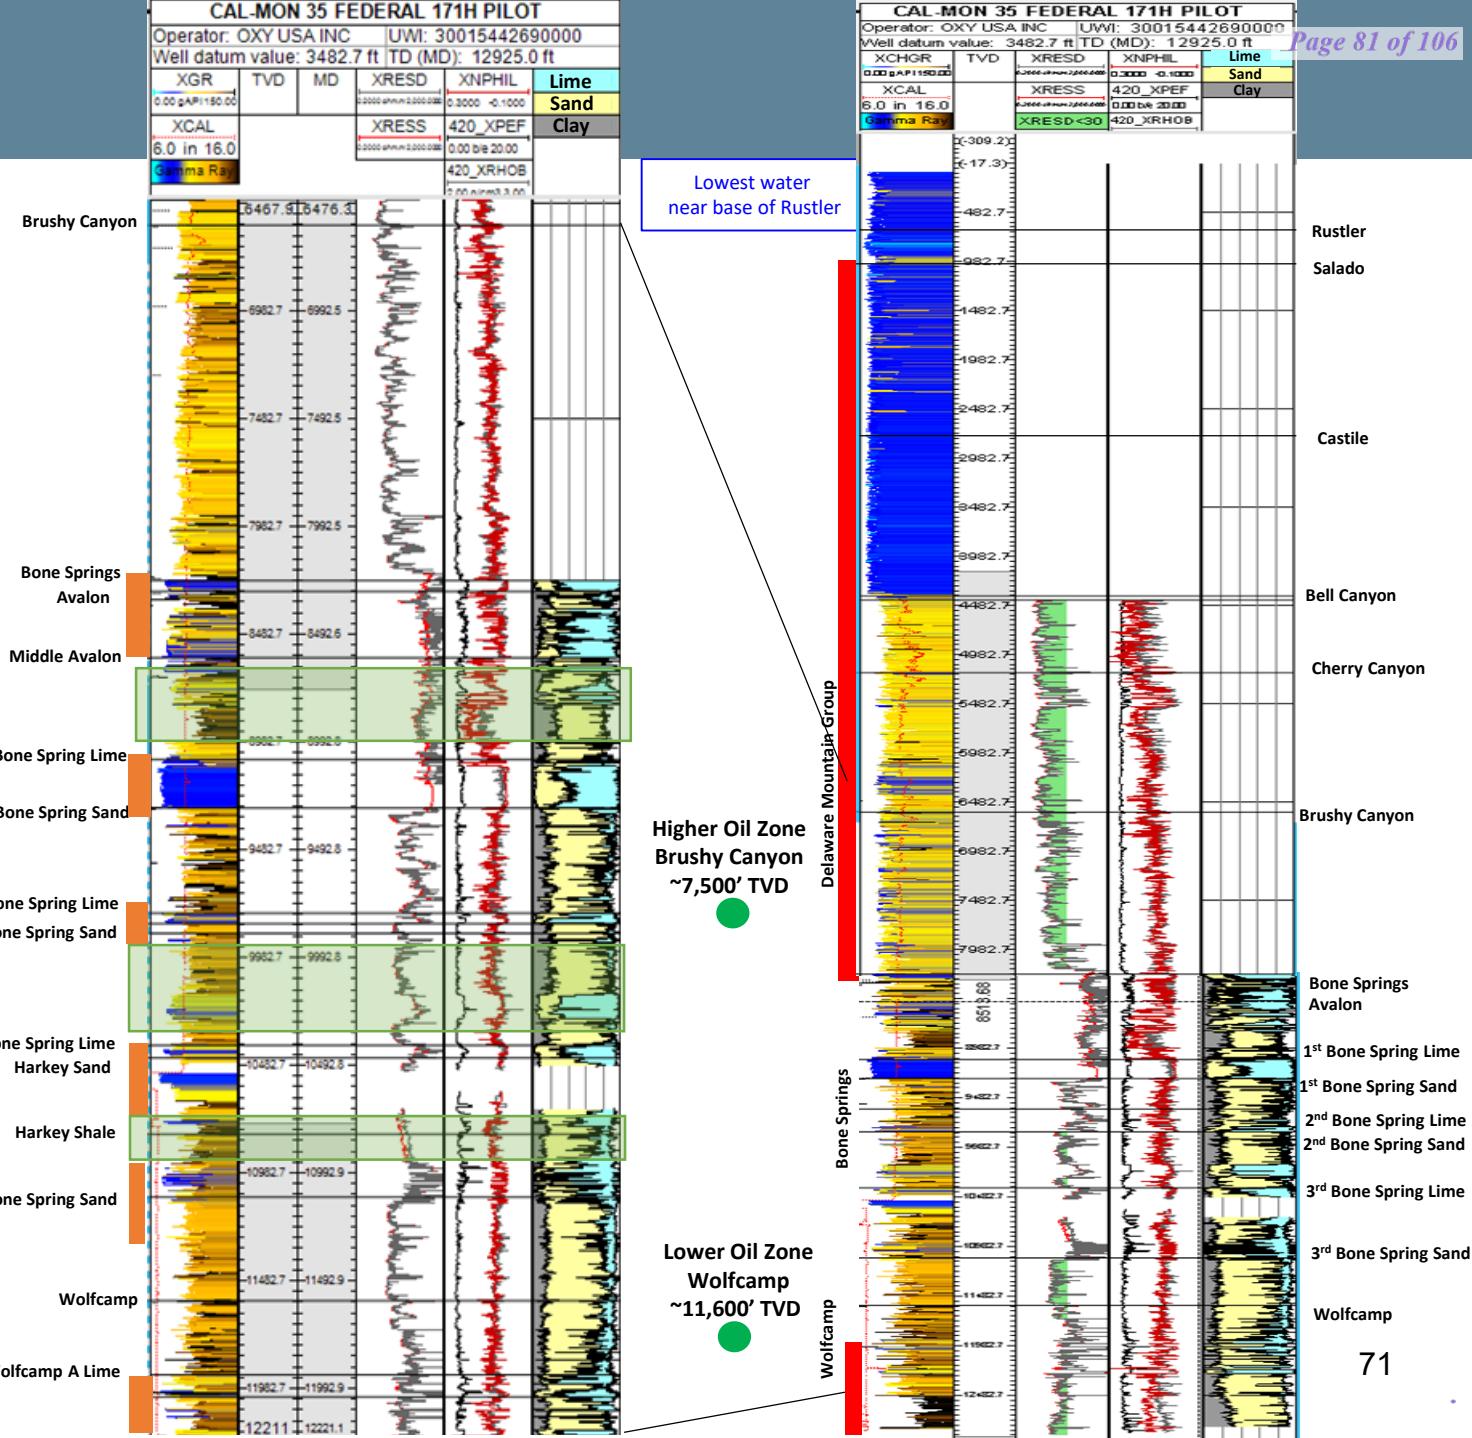

- Low permeability & porosity limes and siltstones at the top of the Avalon
- Low permeability & porosity siltstones and shales of the lower Wolfcamp

## Surrounding Production

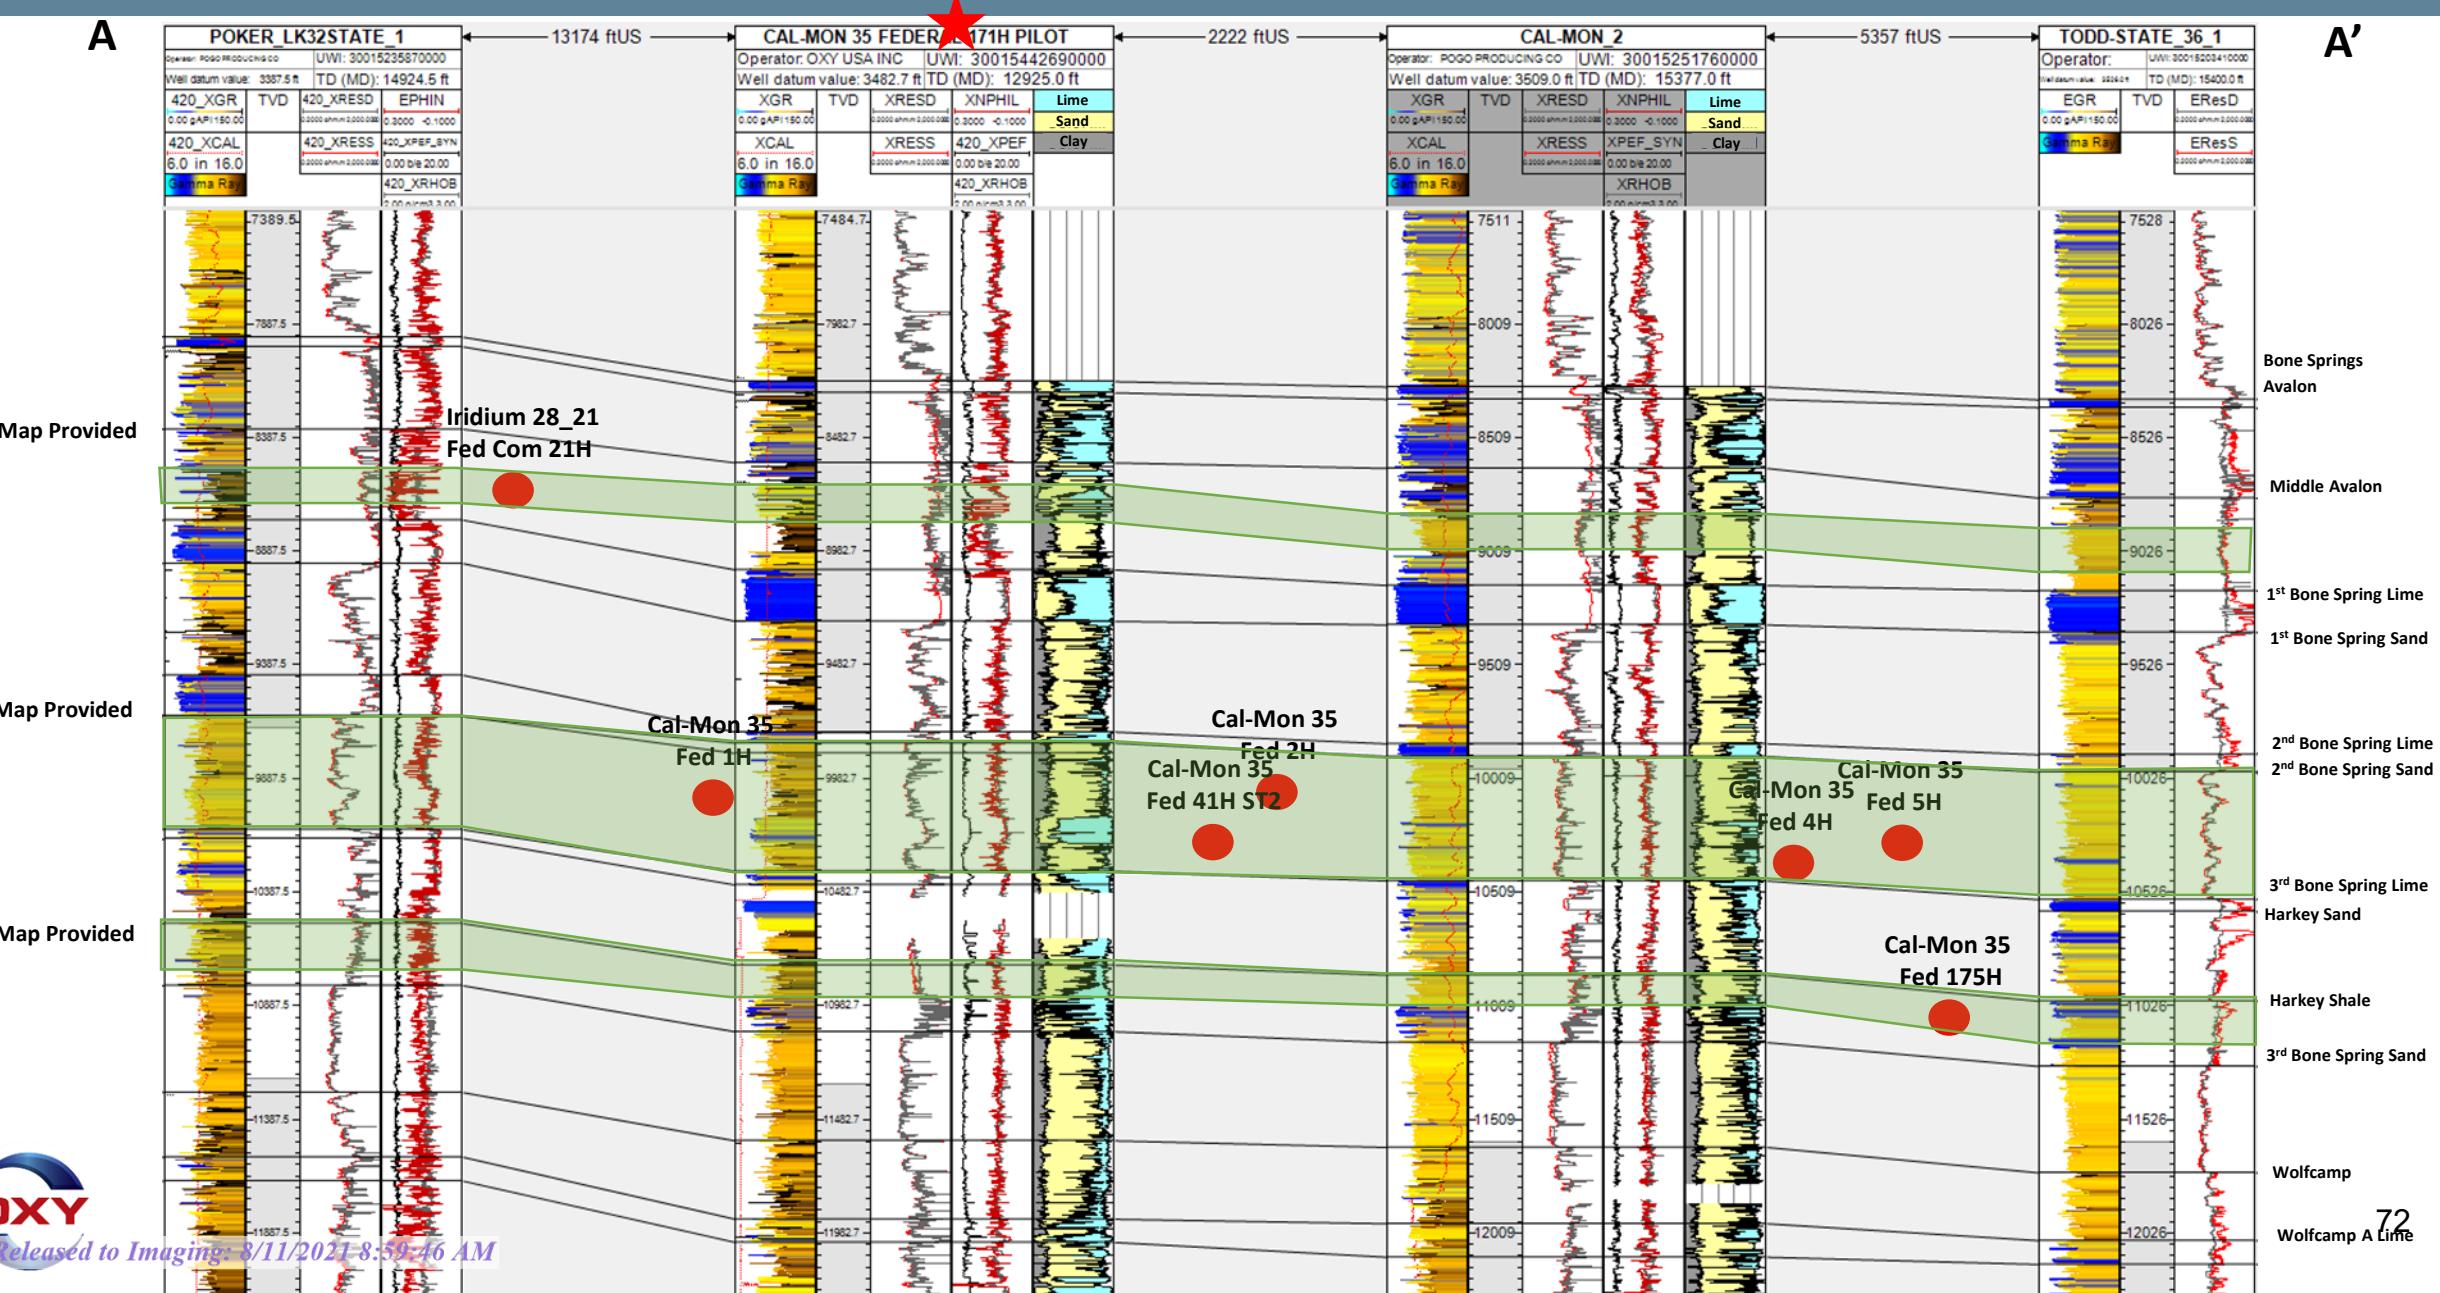

- Delaware Mountain Group
  - > Brushy Canyon oil production: Deepest production ~7,500' TVD
- Wolfcamp
  - > Oil production: Shallowest production ~11,600' TVD

 Barriers to migration from gas injected into the Bone Spring or Wolfcamp

## Geologic Information for Wells injecting into the Avalon member of the Bone Spring Formation

One well will be injecting into the lower portion of the Avalon member of the Bone Spring Formation. The well has an average TVD of approximately 8,700 ft. with a lateral length of approximately 10,500 ft. The Avalon is a very fine-grained quartz-rich and brittle siltstone with alternating cycles of carbonate rich mudstones deposited by gravity flows. Core data and petrophysical analysis indicates a tight reservoir with an average porosity of 8.4% and an average permeability of 0.000340mD. The reservoir has a clay content of 20–26% including illite and smectite. Cements include Fe-calcite, Fe-dolomite, with some quartz overgrowths. Minor amounts of pyrite (<1%) are present.

Low-permeability barriers within the upper Avalon and the 1<sup>st</sup> Bone Spring Lime act as barriers directly above and below the reservoir. The upper Avalon consist of fine-grained siltstones, carbonate mudstone and dolomudstone that have very low vertical permeabilities and an average thickness of 450 ft. Underlying is the 1<sup>st</sup> Bone Spring Lime, a ~ 200ft thick carbonate rich interval that acts as a flow barrier. Laterally the injection will be primarily contained by the reservoir volume that has been previously and partially depleted by the adjacent producing wells. The tight low-permeability reservoir and the production from the adjacent wells will be the primary constraints on the conformance of the injection to the project area and are expected to contain the injected gas.

The top of the Bone Spring Formation is at approximately 8,000 ft. TVD, with over 2,000 ft. of carbonate mudstones and shales acting as permeability barriers to upward migration of injected gas. Overlying the Bone Springs is the Delaware Mountain Group, which consists of connate-water bearing and hydrocarbon-bearing low permeability and porosity sands, with minor limestone and shale intervals and is approximately 3,700 ft. thick. Above that is the Castile Formation consisting of very low permeability anhydrite, gypsum, and calcite that acts as another 1,500 ft. thick barrier to upward movement of fluids. The Salado overlies the Castile and forms a 1,000 ft. thick barrier of salt. The top of the Salado is at approximately 750 ft. TVD and the deep aquifers found just above the Salado at the base of the Rustler are saline water. The top of Rustler Formation is at approximately 400 ft. The Rustler top is a continuous anhydrite layer that acts as another permeability barrier creating a perched aquifer above it that is the lowest level where fresh water is known in the area, water wells drilled in the area typically have not reached this depth. Due to the thickness of multiple impermeable rock layers above the injection reservoir there is little possibility for migration upward into freshwater aquifers where they exist.

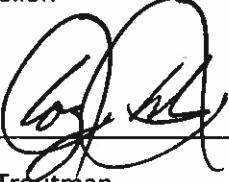

### Locate freshwater wells within two miles:

An investigation of existing shallow water wells has not found any freshwater wells within a two mile radius of this injector.

### Well List:

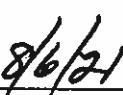

Iridium MDP1 28-21 Fed Com 21H

### **Geologic Information for Wells injecting into the 2<sup>nd</sup> Bone Spring Sand Member of the Bone Spring Formation**

Five wells will be injecting into the 2<sup>nd</sup> Bone Spring Sandstone of the Bone Spring Formation. The wells have an average TVD of approximately 9,800 ft. with lateral lengths of approximately 5,000 ft. The wells inject into a reservoir composed of tight siltstone, laminated mudstone, and pelagic shales. Core data and petrophysical analysis indicates a tight reservoir with a 7% average porosity and an average permeability of 0.0016mD. The reservoir has a clay content of 20–26% including illite and smectite. Cements include Fe-calcite, Fe-dolomite, with some quartz overgrowths. Minor amounts of pyrite (<1%) are present.

Low-permeability carbonate mudstones and dolomudstone barriers of the 2<sup>nd</sup> Bone Spring Lime and 3<sup>rd</sup> Bone Spring Lime act as flow barriers directly above and below the reservoir. Laterally the injection will be primarily contained by the reservoir volume that has been previously and partially depleted by the adjacent producing wells. The tight low-permeability reservoir and the production from the adjacent wells will be the primary constraints on the conformance of the injection to the project area and are expected to contain the low pressure injected gas.

The top of the Bone Spring Formation is at approximately 8,000 ft. TVD, with over 2,000 ft. of carbonate mudstones and shales acting as permeability barriers to upward migration of injected gas. Overlying the Bone Springs is the Delaware Mountain Group, which consists of connate-water bearing and hydrocarbon-bearing low permeability and porosity sands, with minor limestone and shale intervals and is approximately 3,700 ft. thick. Above that is the Castile Formation consisting of very low permeability anhydrite, gypsum, and calcite that acts as another 1,500 ft. thick barrier to upward movement of fluids. The Salado overlies the Castile and forms a 1,000 ft. thick barrier of salt. The top of the Salado is at approximately 750 ft. TVD and the deep aquifers found just above the Salado at the base of the Rustler are saline water. The top of Rustler Formation is at approximately 400 ft. The Rustler top is a continuous anhydrite layer that acts as another permeability barrier creating a perched aquifer above it that is the lowest level where fresh water is known in the area, water wells drilled in the area typically have not reached this depth. Due to the thickness of multiple impermeable rock layers above the injection reservoir there is little possibility for migration upward into freshwater aquifers where they exist.

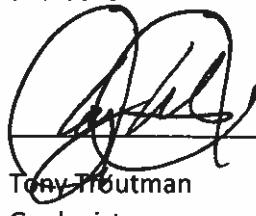

#### **Locate freshwater wells within two miles:**

An investigation of existing shallow water wells has not found any freshwater wells within a two mile radius of this injector.

**Geologic Information for Wells injecting into the 3<sup>rd</sup> Bone Spring Lime Member, Bone Spring Formation**

One well will be injecting into the 3<sup>rd</sup> Bone Lime; specifically, into the siliciclastic member the Harkey Shale. The well has an average TVD of approximately 10,950 ft. with lateral length of approximately 5,000 ft. The well injects into a reservoir which is composed of tight siltstones and mudstones deposited in a lowstand turbidite environment and has an average porosity of 7% and an average permeability of 0.0003 mD.

Where developed the middle 3<sup>rd</sup> Bone Lime acts as barrier directly above the injection reservoir, where less developed shales and tight siltstones act as a barrier. This upper barrier is approximately 200ft. Low permeability and porosity siltstones, carbonate mudstones, and shales of the 3<sup>rd</sup> Bone Spring Lime act as a barrier below the Harkey; this interval is approximately 250 ft. thick. Laterally the injection will be primarily contained by the reservoir volume that has been previously and partially depleted by the adjacent producing wells. The tight low-permeability reservoir and the production from the adjacent wells will be the primary constraints on the conformance of the injection to the project area and are expected to contain the injected gas.

The top of the Bone Spring Formation is at approximately 8,000 to 8,200 ft. TVD depending on location within the field, with over 2,000 ft. of carbonate mudstones and shales acting as permeability barriers to upward migration of injected gas. Overlying the Bone Springs is the Delaware Mountain Group, which consists of connate-water bearing and hydrocarbon-bearing low permeability and porosity sands, with minor limestone and shale intervals and is approximately 3,700 ft. thick. Above that is the Castile Formation consisting of very low permeability anhydrite, gypsum, and calcite that acts as another 1,500 ft. thick barrier to upward movement of fluids. The Salado overlies the Castile and forms a 1,000 ft. thick barrier of salt. The top of the Salado is at 750-900 ft. TVD (depending on location within the field) and the deep aquifers found just above the Salado at the base of the Rustler are saline water. The top of Rustler Formation is at approximately 500 ft. The Rustler top is a continuous anhydrite layer that acts as another permeability barrier creating a perched aquifer above it that is the lowest level where fresh water is known in the area, water wells drilled in the area typically have not reached this depth. Due to the thickness of multiple impermeable rock layers above the injection reservoir there is little possibility for migration upward into freshwater aquifers where they exist.

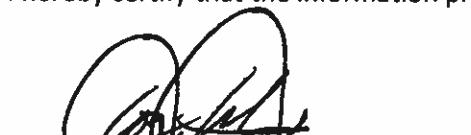

**Locate freshwater wells within two miles:**

An investigation of existing shallow water wells has not found any freshwater wells within a two mile radius of this injector.

Closed Loop Gas Capture (CLGC) Project

Affirmative Statement 1

The operator examined the available geologic and engineering data and found no evidence of open faults or other hydrologic connections between the disposal zone and any underground source of drinking water.

# Reservoir Engineering

# Project Overview- NC

- Closed loop gas capture project (CLGC) IN Oxy's NM assets
- Produced gas injection into productive formations in NM (Avalon, 2<sup>nd</sup> Bone Spring, Harkey)
- Gas injection into horizontal wells of varying lateral length (5,000'-10,000')
- Purpose of Modeling
  - >Review potential effects on wells adjacent to the CLGC area
  - >Quantify movement of the injected gas
  - >Utilize data from Cedar Canyon Huff and Puff Projects

## Model Set-up

- Uses Cedar Canyon Sec 16 2<sup>nd</sup> BSS (as shown in layout below)
- Gas Injection pilot (EOR) was implemented in CC16-7H well in 2017
- Reservoir model is history matched for primary production and gas injection pilot
- Model is also tuned to capture injection gas breakthrough in offset wells that was observed during pilot period
- Gas injection pilot wells are 4 wells per section; model is adjusted to simulate the effect of closer wells (6 wps)

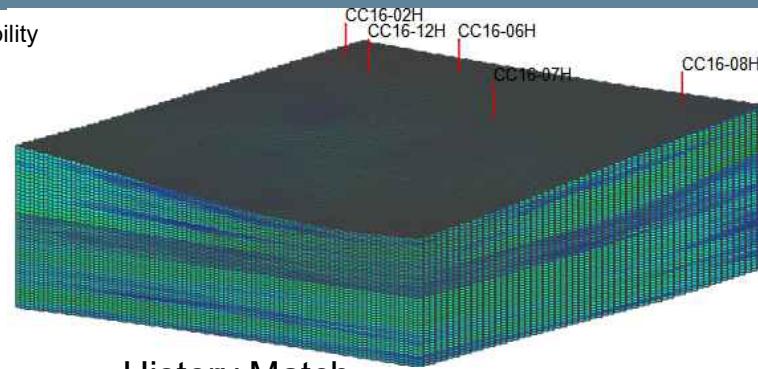

# Cedar Canyon Section-16 Reservoir Model

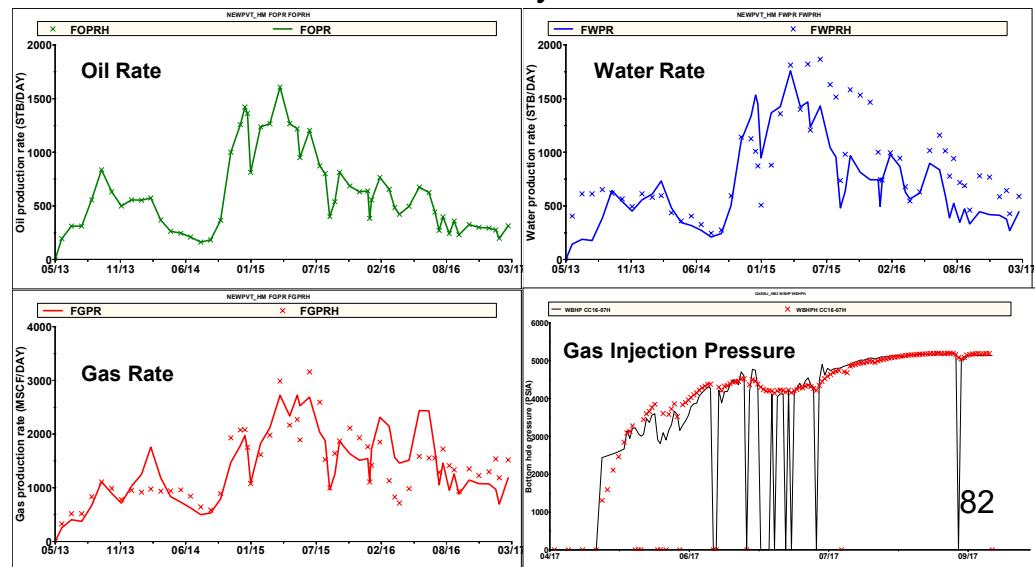

Location: Lea County, NM  
 Model Acreage: 640  
 Pay Horizon: 2<sup>nd</sup> Bone Springs Sand  
 Lithology: Sandstone interbedded with Limestone  
 Trap Type: Stratigraphic  
 Nominal Depth: 8400 ft  
 Gas Cap (at discovery): No  
 Primary Drive Mechanism: Solution Gas Drive

Gross Pay:	320 ft
Net Pay:	320 ft
Avg Porosity:	6.8%
Initial Sw:	50%
Permeability:	0.001md (matrix)
Initial Reservoir Pressure:	4500 psi
Reservoir Temperature:	150 F
Oil Gravity:	42 API
Boi:	1.63 RB/STB
Rsi:	1480 SCF/STB
Original Oil in Place:	28 MMSTB
Released to Imaging: 8/11/2021 8:59:46 AM	

Structure & Permeability  
 1,177,400 Grids  
 56 Layers

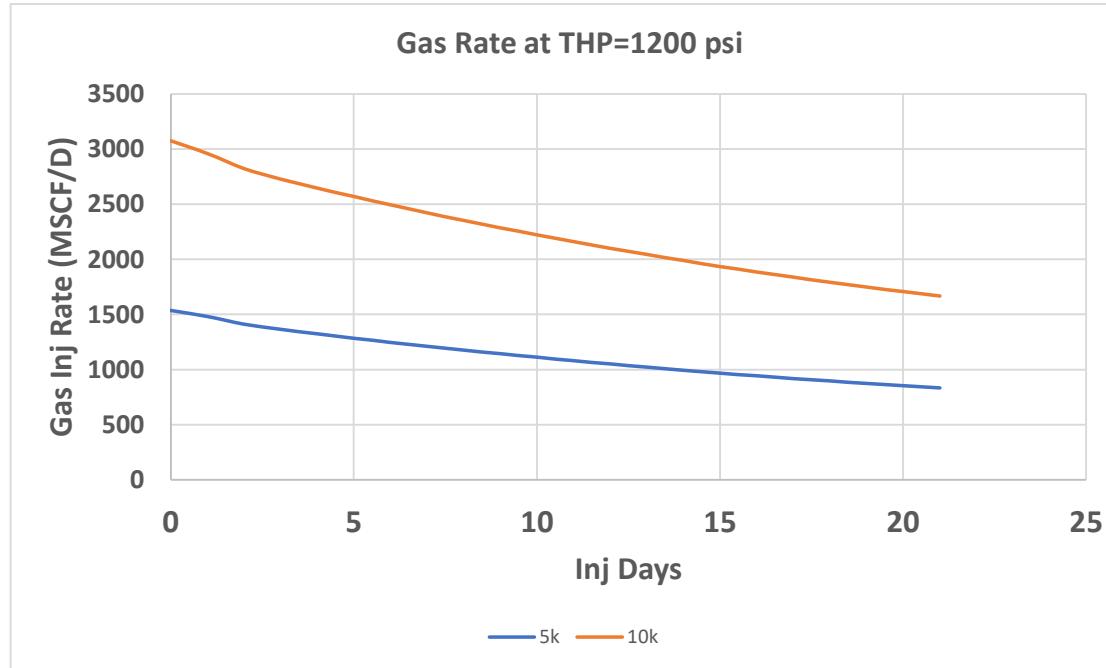

## Model Inputs

# Gas Storage Simulation Process

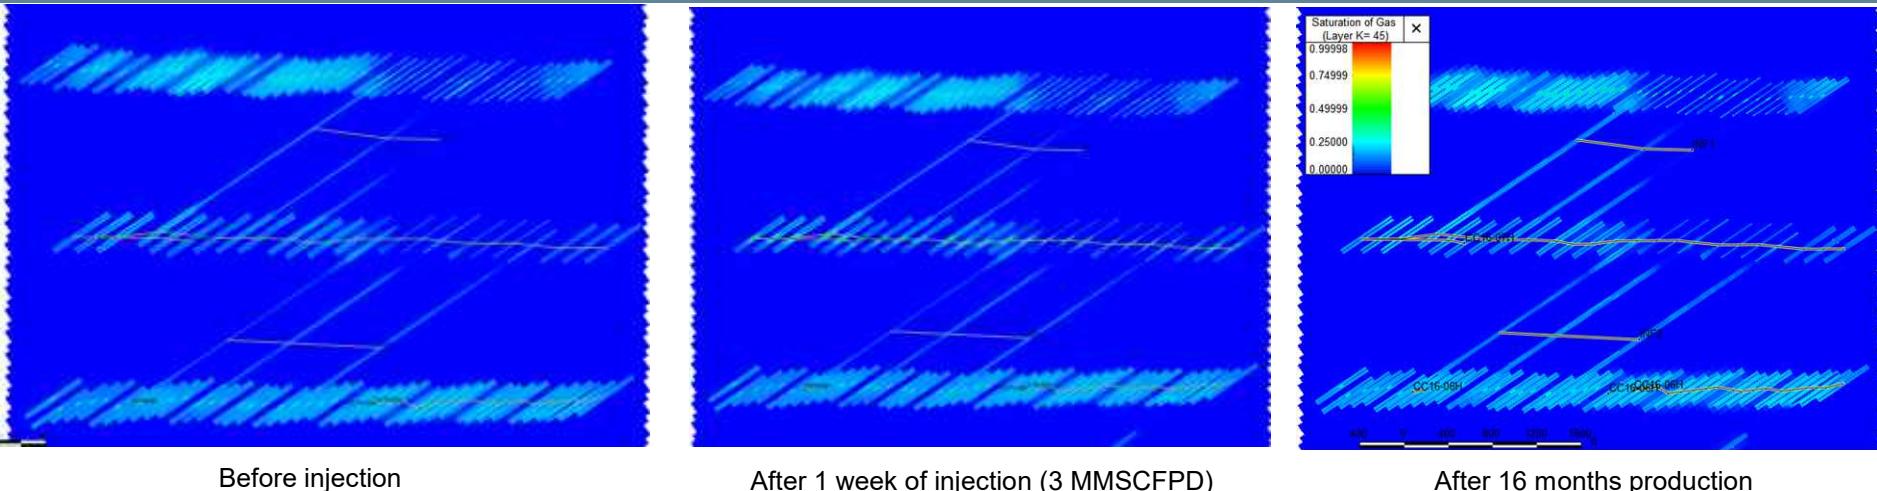

- Run primary production for all wells for additional period (post history match) – Base Case
- Inject gas in injection well at 2MMSCFPD for 7 days
- Produce the injection well post injection – Injection Case
- Observe the effect on oil, gas rate/recovery in injection well and offset wells by comparing Base and Injection cases

# Gas injection rates

For a 10k well, 3 MMSCFPD is the max injection rate at THP of 1200 psi. Injection rate declines to about 50% of its initial value in 3 weeks. For long injection case a flat injection rate of 3MMSCFPD for 3 weeks is used as worst-case scenario. There is no major increase in rate if THP is increased to 1250 psi.

# Gas injection Profile

Before injection

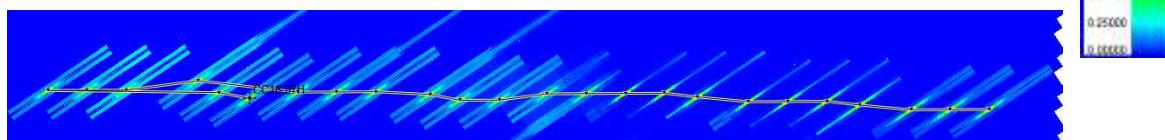

After 1 week of injection (3 MMSCFPD)

After 16 months production

Before Injection CC16-7H Blow-up

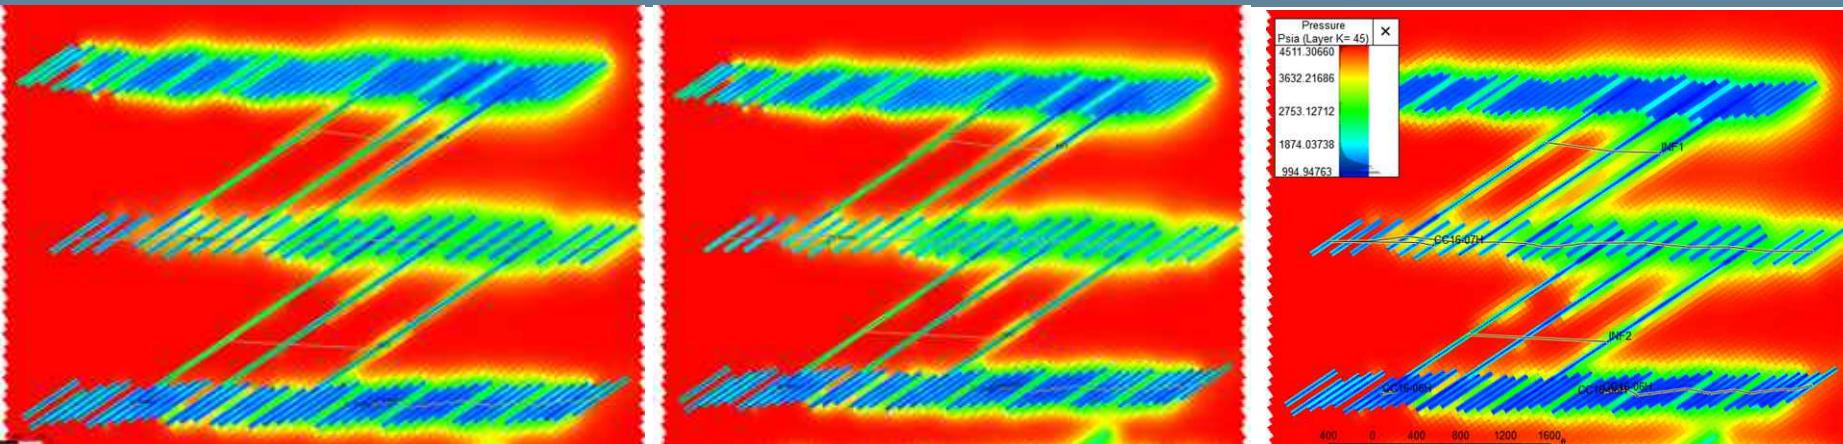

After Injection CC16-7H Blow-up

- Gas is stored within fractures.
- All injection cases indicate horizontal gas movement of 100 ft or less into the fractures.

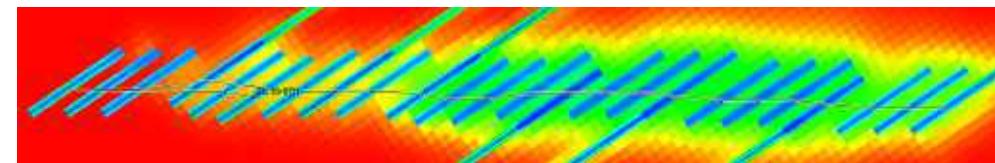

# Pressure Profile

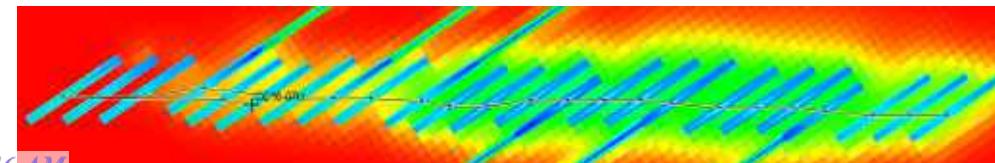

Before injection

After 1 week of injection (3 MMSCFPD)

After 16 months production

Before Injection CC16-7H  
Blow-up

Pressure (Pisia, Layer K=45)
4511.30660
3632.1686
2753.12712
1874.03738
994.94763

After Injection CC16-7H  
Blow-up

Pressure (Pisia, Layer K=45)
4511.30660
3632.1686
2753.12712
1874.03738
994.94763

# Summary of Cases

Case	Injection Description*	WPS	Oil recovery effect in injected well (MBO)	Oil recovery effect in offset wells (MBO)	Gas breakthrough in Offset well
1	Single Well	4	No change	No change	No
2	Single Well**	6	No change	No change	No
3	Single Well	8	No change	No change	No
4	Single Well (Multiple injection and production cycles)	6	No change	No change	No
5	Single well***	6	No change	No change	No
6	Multiple Adjacent Wells	4	No change	No change	No
7	Multiple Adjacent Wells	6	No change	No change	No
8	Multiple Adjacent Wells	8	No change	No change	No

\*All injection at 2MMSCF/DAY for 7 days except cases 2 and 5

\*\*Injection at 3MMSCF/DAY for 7 days

\*\*\*Injection at 3MMSCF/DAY for 21 days

# Gas Storage Capacities - NC

API	Well Name	Gas Storage Capacity with 1200 psi WHP Injection	
		Fracture volume gas equivalent, mmscf	Total prod gas equivalent, mmscf
30015447710000	CAL MON MDP1 35 FED 001H	130	722
30015447720000	CAL MON MDP1 35 FED 002H	130	762
30015447740000	CAL MON MDP1 35 FED 004H	129	613
30015447750000	CAL MON MDP1 35 FED 005H	129	789
30015455240000	CAL-MON 35 FED 175H	133	376
30015431400200	CAL-MON FEDERAL 35 41H ST2	145	883
30015450740000	IRIDIUM MDP1 28-21 FED COM 21H	276	1806

- **Gas storage capacity is high for each well**
  - Even just stored gas in fractures, the capacity is over 100 mmscf
- The expected gas injection volume for each well during each event could be up to 60 mmscf, this is way below the storage capacity

# Frac height and SRV - NC

- **Frac height:**
  - **Avalon: Based on Tanks Avogato**
    - **XH= 340'**
    - **Xf = 350'**
  - **2BSS: Based on Nimitz**
    - **XH = 285',**
    - **Xf = 300-400'**
  - **Harkey**
    - **XH = 350'**
    - **Xf=400'**
- **SRV**
  - **SRV= 2\*Xf\*Xh\*Well length**

Closed Loop Gas Capture (CLGC) Project

Affirmative Statement 2

The operator examined the available geologic and engineering data and determined 1) the total recoverable volume of hydrocarbons from the reservoir will not be adversely affected by the project and 2) the gas composition will not damage the reservoir.
