LEA COUNTY, NEW MEXICO

WHEREAS, certain agreements entitled "Unit Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico" and "Unit Operating Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico", are being entered into as of July 1, 1978, between the signatory parties for the purpose of unitizing and conducting unit operations in a portion of the Hobbs (Grayburg-San Andres) Field, in Lea County, New Mexico, the unit boundaries and the tracts comprising the unit area being shown on Exhibit A and said tracts being described in Exhibit B of the exhibits attached to said unit agreement; and

WHEREAS, the undersigned is the owner of a royalty interest or a working interest, or both, as said interests are defined in said unit agreement, in one or more of the tracts described in said Exhibit B, and the undersigned desires to commit said interest or interests to said unit agreement:

NOW, THEREFORE, KNOW ALL MEN BY THESE PRESENTS that each of the undersigned (whether one or more), for and in consideration of the premises and pursuant to the joinder provisions contained in said agreements, does hereby ratify and agree to be bound by the provisions of the said unit agreement as a party thereto, and if the undersigned is the owner of a working interest, does also hereby ratify and agree to be bound by the provisions of the said unit operating agreement as a party thereto, the same in each case as if the undersigned had executed a counterpart of the agreement. Receipt of a counterpart in each case is hereby acknowledged by the undersigned.

IN WITNESS WHEREOF, each of the undersigned has executed this instrument on the date stated below.

RATIFICATION
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT
LEA COUNTY, NEW MEXICO

WHEREAS, certain agreements entitled "Unit Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico" and "Unit Operating Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico", are being entered into as of July 1, 1978, between the signatory parties for the purpose of unitizing and conducting unit operations in a portion of the Hobbs (Grayburg-San Andres) Field, in Lea County, New Mexico, the unit boundaries and the tracts comprising the unit area being shown on Exhibit A and said tracts being described in Exhibit B of the exhibits attached to said unit agreement; and

WHEREAS, the undersigned is the owner of a royalty interest or a working interest, or both, as said interests are defined in said unit agreement, in one or more of the tracts described in said Exhibit B, and the undersigned desires to commit said interest or interests to said unit agreement:

NOW, THEREFORE, KNOW ALL MEN BY THESE PRESENTS that each of the undersigned (whether one or more), for and in consideration of the premises and pursuant to the joinder provisions contained in said agreements, does hereby ratify and agree to be bound by the provisions of the said unit agreement as a party thereto, and if the undersigned is the owner of a working interest, does also hereby ratify and agree to be bound by the provisions of the said unit operating agreement as a party thereto, the same in each case as if the undersigned had executed a counterpart of the agreement. Receipt of a counterpart in each case is hereby acknowledged by the undersigned.

IN WITNESS WHEREOF, each of the undersigned has executed this instrument on the date stated below.

RATIFICATION
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT
LEA COUNTY, NEW MEXICO

WHEREAS, certain agreements entitled "Unit Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico" and "Unit Operating Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico", are being entered into as of July 1, 1978, between the signatory parties for the purpose of unitizing and conducting unit operations in a portion of the Hobbs (Grayburg-San Andres) Field, in Lea County, New Mexico, the unit boundaries and the tracts comprising the unit area being shown on Exhibit A and said tracts being described in Exhibit B of the exhibits attached to said unit agreement; and

WHEREAS, the undersigned is the owner of a royalty interest or a working interest, or both, as said interests are defined in said unit agreement, in one or more of the tracts described in said Exhibit B, and the undersigned desires to commit said interest or interests to said unit agreement:

NOW, THEREFORE, KNOW ALL MEN BY THESE PRESENTS that each of the undersigned (whether one or more), for and in consideration of the premises and pursuant to the joinder provisions contained in said agreements, does hereby ratify and agree to be bound by the provisions of the said unit agreement as a party thereto, and if the undersigned is the owner of a working interest, does also hereby ratify and agree to be bound by the provisions of the said unit operating agreement as a party thereto, the same in each case as if the undersigned had executed a counterpart of the agreement. Receipt of a counterpart in each case is hereby acknowledged by the undersigned.

IN WITNESS WHEREOF, each of the undersigned has executed this instrument on the date stated below.

NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT
LEA COUNTY, NEW MEXICO

WHEREAS, certain agreements entitled "Unit Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico" and "Unit Operating Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico", are being entered into as of July 1, 1978, between the signatory parties for the purpose of unitizing and conducting unit operations in a portion of the Hobbs (Grayburg-San Andres) Field, in Lea County, New Mexico, the unit boundaries and the tracts comprising the unit area being shown on Exhibit A and said tracts being described in Exhibit B of the exhibits attached to said unit agreement; and

WHEREAS, the undersigned is the owner of a royalty interest or a working interest, or both, as said interests are defined in said unit agreement, in one or more of the tracts described in said Exhibit B, and the undersigned desires to commit said interest or interests to said unit agreement:

NOW, THEREFORE, KNOW ALL MEN BY THESE PRESENTS that each of the undersigned (whether one or more), for and in consideration of the premises and pursuant to the joinder provisions contained in said agreements, does hereby ratify and agree to be bound by the provisions of the said unit agreement as a party thereto, and if the undersigned is the owner of a working interest, does also hereby ratify and agree to be bound by the provisions of the said unit operating agreement as a party thereto, the same in each case as if the undersigned had executed a counterpart of the agreement. Receipt of a counterpart in each case is hereby acknowledged by the undersigned.

IN WITNESS WHEREOF, each of the undersigned has executed this instrument on the date stated below.

RATIFICATION
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT
LEA COUNTY, NEW MEXICO

WHEREAS, certain agreements entitled "Unit Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico" and "Unit Operating Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico", are being entered into as of July 1, 1978, between the signatory parties for the purpose of unitizing and conducting unit operations in a portion of the Hobbs (Grayburg-San Andres) Field, in Lea County, New Mexico, the unit boundaries and the tracts comprising the unit area being shown on Exhibit A and said tracts being described in Exhibit B of the exhibits attached to said unit agreement; and

WHEREAS, the undersigned is the owner of a royalty interest or a working interest, or both, as said interests are defined in said unit agreement, in one or more of the tracts described in said Exhibit B, and the undersigned desires to commit said interest or interests to said unit agreement:

NOW, THEREFORE, KNOW ALL MEN BY THESE PRESENTS that each of the undersigned (whether one or more), for and in consideration of the premises and pursuant to the joinder provisions contained in said agreements, does hereby ratify and agree to be bound by the provisions of the said unit agreement as a party thereto, and if the undersigned is the owner of a working interest, does also hereby ratify and agree to be bound by the provisions of the said unit operating agreement as a party thereto, the same in each case as if the undersigned had executed a counterpart of the agreement. Receipt of a counterpart in each case is hereby acknowledged by the undersigned.

IN WITNESS WHEREOF, each of the undersigned has executed this instrument on the date stated below.

INTRODUCTION

The object of this report is to fulfill the charge by the Working Interest Owners with respect to that portion of the Hobbs (Grayburg-San Andres) Field which underlies the proposed North Hobbs Unit Area. That charge was to recommend a plan of depletion, including economic comparisons with continued primary operations, and provide the Working Interest Owners certain parameters for a basis to negotiate, all for the incentive and purpose of pursuing unitized supplemental recovery operations.

An Engineering Subcommittee Report, "Waterflood Feasibility and Unitization Parameters, Hobbs (Grayburg-San Andres) Pool", was published in March, 1972 as a basis for unitizing the entire Grayburg-San Andres reservoirs in the Hobbs Field. However, agreement could not be reached on participation and efforts to unitize the Hobbs Field in its entirety were abandoned. At the Working Interest Owners' meeting held on July 12, 1973, it was agreed to divide the Field into two parts for unitization purposes. Amoco was to act as Unit Expeditor for the South Hobbs Unit and Shell for the North Hobbs Unit. The South Hobbs Unit (operated by Amoco) became effective on January 1, 1975 and includes most of the leases in Township 19 South plus three Amoco tracts (280 acres) in Township 18 South. This unit contains approximately one-third of the OOIP, one-fourth of the cumulative oil production and one-fifth of the current oil production from the Grayburg-San Andres reservoirs. Water injection operations for this unit began in December, 1975.

Where applicable, basic data included in the March 1972 report has been used in the development of this study. A conscious effort has been made to minimize repetition and to concentrate instead on the changes and new work that have been accomplished. The following report includes a description of practically all of the studies made. Although subsequently many of these approaches were not used, in the final analysis, they are recorded here for completeness and understanding of the work performed.

ACKNOWLEDGEMENT

The Chairman of the Technical Committee would like to thank all of the Companies which were represented at the Technical Committee meetings. The technical caliber and spirit of cooperation of those attending were outstanding. We were blessed with large turnouts and an average of thirteen Companies were represented at each work session. Most of the work presented in the following pages was unanimously agreed to by the participating Technical Committee members.

H. J. Swartz

SUMMARY

Cumulative oil production, to January 1, 1977, is 167 MMB or 28.9 percent of the 578 MMB original oil-in-place in the proposed unit area. Primary reserves of 38.1 MMB indicate that the average recovery efficiency will be 35.5 percent by natural means. The proposed unitized water injection operation is economically feasible and will increase the ultimate oil recovery by 55 million barrels.

Tract primary oil reserves have been determined by the use of production decline curve analyses for the Grayburg and upper San Andres stringers and by the use of a mathematical reservoir simulation program for the main San Andres reservoirs. Both methods account for future oil migration.

Waterflood operations will require the drilling of 20.5 Unit wells (15.5 injectors and 5 producers) in order to obtain controlled and balanced water injection despite significant differences in permeability between zones and irregular spacing of wells along lease lines. These numbers include five injectors (2.5 unit wells) which are proposed to be drilled along the common boundary with the Amoco-operated South Hobbs Unit.

CONCLUSIONS

All of the following conclusions refer to only the proposed North Hobbs Unit Area as outlined in Figure 2:

1. The Hobbs (Grayburg-San Andres) Field is comprised of at least four zones (one Grayburg and three San Andres) which are performing as separate reservoirs. The upper San Andres (Zone I) has an active water influx. The remaining zones behave as solution gas drive reservoirs with only localized, minor water encroachment caused by communication with Zone I.

2. The original oil-in-place is 61.6 million barrels in the Basal Grayburg, 171.6 million barrels in the San Andres Zone I and 344.9 million barrels in San Andres Zones II, III_U and III_L. Cumulative oil production to January 1, 1977 is 167 million barrels or 28.9 percent of the original oil in place. Approximately 157 million barrels of this amount has been produced from the San Andres formation.

3. Original gas caps were found in only the upper two reservoirs and contained 45,603 MMCF in the Basal Grayburg and 8609 MMCF in the San Andres Zone I.

4. Ultimate primary recovery will be about 11.5 million barrels (R.E. = 18.7%) from the Basal Grayburg, 104.3 million barrels (R.E. = 60.8%) from the San Andres Zone I, and 89.3 million barrels (R.E. = 25.9%) from San Andres Zones II, III_U and III_L.

5. The strong water influx into Zone I has caused and will continue to cause significant oil migration. The remaining primary tract reserves for all of the main San Andres reservoirs have been determined by the use of a mathematical

reservoir simulation model which incorporated the data developed by the Technical Committee.

6. The proposed water injection program should increase ultimate oil recovery by 55.2 million barrels (6.6 million barrels from the Basal Grayburg and 48.6 million barrels) from the San Andres II, III_U and III_L. No water injection is scheduled for San Andres Zone I.

7. Because of the significant differences in permeability between zones and the irregular well spacing it will be necessary to drill 20.5 wells (5 producers and 15.5 injectors).

8. The proposed project requires an initial capital investment of $23,600,000 and an ultimate capital investment of $24,600,000. The before tax incremental profitability analysis (assuming constant costs and revenues) indicates that the total investment will be repaid in 6.0 years and yield an undiscounted profit of $334 million or 1359 percent. The annual rate of return is 28 percent.

9. The charge by the Working Interest Owners to the Technical Committee (Table 1) has been completed and is presented in this report.

RECOMMENDATIONS

1. It is recommended that the vertical section prorated as the Grayburg - San Andres Field and included in the area outlined in Figure 2 be unitized for the purpose of initiating water injection operations to increase the ultimate oil recovery from the Grayburg and San Andres reservoirs.

2. It is recommended that the source water be obtained from the City of Hobbs industrial process water source.

DISCUSSION

HISTORY

The Hobbs Field discovery well (Amoco State A-5) was completed in mid-1928 for a flowing potential of 700 barrels of clean oil per day. A total of 135 wells were completed and were producing about one million barrels of oil per month by the end of 1930. A high withdrawal rate was continued through 1935 (cumulative oil production of 60 million barrels) when production was greatly curtailed because of reduced demand. The production performance as a function of time is shown for both the Field and the proposed North Unit Area in Graphs 1, 1A and 1B.

A typical early completion in the field was an open hole productive interval with casing set at the top of, or into the Grayburg section with total depth at the "sandy break" which separates San Andres Zones II and III. Open hole packers were used to control gas and/or water production. Some of these packers are still being utilized in existing producers. Primarily because of corrosion, a program of setting liners or full strings of casing was conducted in many wells in the middle 1940's. At this time the first logs were obtained; most were gamma ray-neutron surveys. Concurrent with setting aliner or a full string of casing, numerous wells were deepened to about 614 feet subsea and into the San Andres Zone III_L. Subsequently, there have been a significant number of workovers involving squeezing and reperforating to change completion intervals. As discussed in the following text (PRIMARY PRODUCTION PERFORMANCE TO DATE), many of the wells are now experiencing behind-pipe communication between zones.

In the proposed North Unit Area there are currently 222 producers (368 well zones) and 19 shut in or temporarily abandoned wells. Of these, 130 (59 percent of the active wells) are single zone completions. The number of current

drainage points are: Grayburg 119, San Andres Zone I 88, Zone II 75, Zone III_U 66, and Zone III_L 20. This current well status is detailed in Table 2.

Subsurface disposal of produced water commenced in December 1958. There are currently 3 disposal wells which are operated by Rice Engineering Company. The wells are located in Section 15-T19S and Sections 25 and 29-T18S. Cumulative water injection exceeds 90 million barrels into a lower San Andres zone at depths between 4446 and 5050 feet. The current disposal rate of 22,000 barrels of water per day (on a vacuum) is near the capacity of the system.

GEOLOGY

The Hobbs (Grayburg-San Andres) reservoir is an anticlinal feature about 8 miles long by 3.5 miles wide, trending northwest - southeast. Structure relief is nearly 400 feet above the top of the oil-water transitional zone at 614 feet subsea.

Grayburg: Production from the Grayburg formation is from the lower member, referred to in this study as the Basal Grayburg. The productive member consists of thinly interbedded sandstone, siltstone, and dolomite. Total thickness of the Basal Grayburg varies from 80 feet on the southeast flank to 200 feet on the northwest and southwest flanks. Approximately half of the interval is indicated by logs to be sandstone and/or siltstone. Detailed review of core data from 18 wells and microscopic examination of core slabs from two wells indicate that Grayburg productivity is mostly confined to the sandstone beds. Because of the inability to identify the nonpermeable siltstone beds from logs, the lateral continuity of permeable sandstone is questionable. It is therefore not possible to prepare meaningful continuous pay maps for the Basal Grayburg. Because of the type of logging surveys, it is also not possible to make a meaningful determination of porosity variations across the field. Therefore, only net pay isopach maps have been prepared for the Grayburg.

As shown on the example log (Figure 3), the Basal Grayburg interval is divisible into two zones. The upper zone contains nine sandy units that can be traced over the entire area of study and usually has a total thickness between 80 and 100 feet. However, the zone reaches a thickness of 150 feet on the southwest flank in Sections 30 and 31 and on the northwest area in Sections 13 and 14. This zone probably contains most of the floodable Grayburg oil. Figure 4 is a structure map on the top of the Upper Basal Grayburg Zone.

The lower zone is developed as a "wedge" along the southwest and northwest flanks of the structure where it may reach a thickness of nearly 80 feet. On the crest of the structure it is usually less than 15 feet thick and is often absent. Sands within the lower zone generally show poor continuity. Figure 5 is a structure map of the top of the Lower Basal Grayburg Zone.

Because of differences in the development of these two intervals of the Basal Grayburg, separate net pay maps were prepared. These maps were constructed by utilizing contour maps of the percent net pay to gross thickness ratio for each zone (Figures 6 and 7) in conjunction with gross thickness measurements (Table 3). The percent net pay to gross thickness ratio determinations were made from: (1) core data in 16 wells (using net pay cutoff parameters of 11% porosity and 0.2 millidarcies permeability), and (2) selected log control points for 21 wells with "good quality" logs. Gross thickness measurements were based on consistent field-wide correlations.

The resulting four net pay maps (Figures 8-11) are based on fluid contacts of: gas-oil at 360 feet subsea and oil-water at 614 feet subsea.

San Andres: The San Andres reservoir has been divided into four zones, although it is more thin-bedded than indicated by this zonation. As shown on the example log (Figure 12), there is a significant vertical variation in porosity. Produc-

tion history and bottom hole pressure build up data also indicate a wide vertical variation in permeability.

The upper surface of the San Andres is erosional, which probably affected the pay development of the upper interval, Zone I. Figure 13 is a structure map contoured on the top of the San Andres formation. Although 10-80 feet of basically impermeable dolomite covers the reservoir, the porous lower part of Zone I is highly permeable and is known to be cavernous in many places. This zone usually contains two or three separated porous units. The lowermost unit appears to be the principal route for encroaching water and can be identified on many logs as a zone of higher porosity. Occasionally, especially on the west flank, upper porous units still produce oil and apparently have been bypassed by the water beneath. An attempt was made to sub-divide Zone I into correlatable subzones, but stratigraphic variations in the distribution of porous beds and separating nonporous layers precluded the successful development of a mappable fieldwide subdivision.

Zone I is separated from Zone II by a thin shaly bed. Although this streak is usually not more than five feet thick it is probably an effective permeability barrier over most of the area away from the well bores. A map estimating the effective natural separation of Zones I and II is presented in Figure 14. This map highlights the limited and localized areas where there is no apparent impermeable layer separating the two zones.

Zone II often contains porosity development as good as or better than Zone I, particularly on the crest of the structure. At the base of Zone II is the "sandy break", which consists of 10-20 feet of mostly impermeable sandy dolomite and dolomitic sandstone and/or siltstone. Occasionally this interval contains porous sandstone that has probably yielded some oil, but log interpretation

suggests that the lateral continuity is poor. The "sandy break" is probably a very effective barrier between the Zone II and III_U reservoirs. Figures 15 and 16 are structure maps on the tops of Zones II and III_U respectively.

Zone III was divided into two parts, although both portions appear geologically similar and are generally more thin-bedded than the overlying zones. High porosity beds such as those accentuated on the example log (Figure 12) are less abundant than in the upper zones, but like Zone II, are best developed on the crest of the structure. Figure 17 is a structure map on the top of Zone III lower.

Lateral continuity of porous rock above the cutoff porosities determined for each zone and referred to herein as "pay" has been evaluated between offsetting wells and found to be excellent throughout the proposed unit area. Average percent continuity between pairs of wells approximating 40-acre spacing (1200-1400 feet) ranges from 90 percent in Zone III to 94 percent in Zone I. Pay continuity in Zone II was found to be the most erratic, where continuity varies from a low of 83 percent in the extreme northwest portion of the study area, to greater than 94 percent in the southeast. Continuous pay maps have been prepared for all four San Andres zones (Figures 18-21). Average percent continuity between offsetting wells approximating 40-acre spacing has been added as a "note" on each map. Areal coverage of these maps is limited by the quality of log data, i.e., greater than 90 percent of the open hole porosity logs available for correlating are located on the crest of the structure (Blinebry wells drilled during 1960's). It should be emphasized that this interpretation is largely qualitative as lateral continuity of pay is not only dependent upon porosity, but also upon permeability, for which there is little data, and distance between wells. Spacing between offsetting San Andres wells varies from about 600 feet to nearly 2,000 feet, and the spacing of open hole porosity logs is even more erratic (200-5,000 feet).

The effect upon percent pay continuity of increasing distance between offsetting wells was evaluated and found to be minimal. No discernable reduction in average percent pay continuity was observed when well spacing was increased from 1,200 feet to 2,500 feet. This should not be interpreted to mean that the porosity is uniformly continuous throughout the unit area. Local barriers to fluid flow, particularly in Zone I, are indicated by production performance. Also, wireline log correlations indicate individual zonal low as 50 percent between wells 500 feet apart and as high as 100 percent between wells spaced 5,000 feet. This variability in pay continuity is illustrated in Graph 2, which is a composite of percent total net pay continuity versus distance between wells.

In summary, the San Andres at Hobbs generally exhibits a high degree of lateral continuity. However, localized barriers to fluid flow are evidenced from production performance and wide variations in continuity are indicated from wireline log correlations. Well to well correlations are summarized in Table 4.

RESERVOIR ROCK PROPERTIES

Core Analyses

Core analysis data available in the Township 18 South area are rather limited and are summarized as follows:

	Grayburg	San Andres			
		I	II	III_U	III_L
No. Wells Cored	19	10	5	4	1
Net Pay (Ft.)	296	212	162	89	15
Avg. ø (%)	14.0	14.9	12.9	12.0	14.0
Arithmetic Avg.					
k (mds.)	2.5	143	45	45	170
Geometric Avg.					
k (mds.)	0.9	16	6	4	32

Porosity values determined from selected log data (described in the next section), are:

	Grayburg	San Andres			
		I	II	III_U	III_L
No. Wells Analyzed	-	114	98	88	28
Net Pay (ft.)	-	4097	3741	3911	1059
Avg. ø (%)	-	14.8	14.2	13.6	13.6

Considering the data from these two sources, the average zonal porosity was determined to be: Grayburg, 14.0%; San Andres Zone I, 14.8%; Zone II, 14.1%; III_U, 13.5%; and III_L, 13.6%.

Stratification analyses using the Dykstra-Parsons variance approach were made using all of the available core data. The average coefficient of permeability variation determined by the use of this technique is: Grayburg

0.7, San Andres Zone I 0.8, Zone II 0.9, Zone III_U 0.8 and Zone III_L 0.9. The San Andres weighted average variance factor is 0.8. The significance of this data and how it is used in this study is described in the section on ULTIMATE PRIMARY RECOVERY.

The members of the Technical Committee realize that the statistical averaging technique applied to the core data has a tendency to minimize the effects of high permeability streaks that exist within the field. Because of the limited amount of core data available, however, this method was adopted.

Petrophysical Analyses

An extensive petrophysical study was undertaken in order to volumetrically describe each San Andres zone being studied. Control points were based on only "good quality" data. Ideally, petrophysical field studies from log analysis are founded upon matching log responses to core data. Unfortunately, the total number of Hobbs Field wells cored in the Grayburg-San Andres are few; the number of these with cores that penetrated into or below the main porosity of Zone I is significantly fewer; and the number of these that have reliable logs to match with the core data is essentially nil. (Refer to Table 5). It was necessary, therefore, to derive the basis for log analysis from some less conventional means.

Of the various types of "porosity" logs available in the Hobbs (Grayburg-San Andres) field, the Sidewall Neutron Porosity Log (SNP) was chosen to be the basis for pore volume determinations. A total of six wells, all Blinebry-Drinkard penetrations with very good quality SNP's and micrologs, were studied in detail. At various points within each zone, the porosity value from the SNP (corrected for lithology effect) was matched with the corresponding degree of micro-inverse to micro-normal separation from the microlog. Each microlog

reading was qualitatively categorized as one of the following: (a) good positive separation (b) slight positive separation and (c) no positive separation. Gamma ray response was also used to differentiate between "clean" and "dirty" rock (gamma ray response higher than halfway between maximum gamma reading from the interval just above the top of the San Andres and the minimum deflection from the main porosity of Zone I). Porosity - separation quality graphs were then constructed using only the points coincident with smooth borehole and stable log response. Consistent averaging relationships were then used to arrive at the following cutoff porosities: Basal Grayburg, 11%; San Andres Zone I, 4.5%; San Andres Zone II, 7% ("clean"), 13% ("dirty"); San Andres Zone III_U, 6% ("clean"), 10% ("dirty"); San Andres Zone III_L, 9% ("clean"), 12% ("dirty").

Ten wells with Acoustic - SNP log combinations were used to establish Δt versus ϕ relationships for each rock type by zone. The Δt cutoffs were assessed to coincide with the corresponding porosity cutoffs previously described.

Sufficient density - SNP data does not exist to establish ρ_b versus ϕ relationships. Core analyses indicate a grain density for San Andres dolomites of about 2.83 grams/cm^3. Density logs were analyzed using this value for ρ_{ma} and the ρ_b vs ϕ relationships published in service company literature.

Open-hole GR/neutron logs which have established departure curves were also analyzed, as were selected cased-hole GR/Neutron logs. In addition, several cased hole Compensated Neutron Logs (CNL) were considered to be useable.

Porosity-feet (ϕh) calculations by zone were performed through the San Andres on all logs determined to be useable. Net pay thickness (h) determinations were made for the Basal Grayburg. Analysis was begun at the Basal Grayburg top and was continued through 614 feet subsea (or "first reading" depth on the log in wells that did not penetrate to 614 feet subsea). Extrapolations were made

in zones of wells that partially penetrated that zone, provided that actual penetration amounted to $\geq$ 50% of the total expected productive thickness of that zone.

As previously discussed (GEOLOGY section) Grayburg net pay was determined from the net to gross ratio isopach map determined from core data. The porosity-feet data derived from these log analyses provided sufficient and reliable data to enable the construction of porosity-feet contour maps for each of the four San Andres zones (Figures 22-26).

It is not possible to accurately estimate the connate water saturations by log analysis because of the lack of sufficient resistivity contrast between the oil and formation water. The formation water is relatively fresh (less than 8000 ppm chlorides), and has a resistivity of about 0.45 ohm-meters^2/meter at 70°F. Based on the work done by the previous Engineering Committee average initial water saturations of 30 percent in the Grayburg and 22 percent in the San Andres were used.

In summary, the Technical Committee porosity-feet (ϕh) maps for each of the four San Andres zones are based on core data and selected log control which are summarized on Table 6. The reliability of these interpretations is considered good and such data provide an excellent relative basis for original hydrocarbon-in-place comparisons. At the Technical Committee meeting of September 11-12, 1974, it was unanimously agreed to adopt a January 1, 1975 cutoff date for all well logging data to be used.

kh From Buildup Analyses

Early bottom hole pressure buildup analyses were taken only by Shell Oil Company. This company has taken 83 buildup surveys in 24 different wells. Only 29 of these surveys (in 10 different wells with single zone completions)

are judged to be useable for zonal kh and reservoir pressure determinations In addition, at the request of the Technical Committee, four special buildup surveys were taken around year-end 1974. Three of these surveys were useable for zonal calculations. The average permeabilities calculated from these selected analyses are as follows:

	Grayburg	San Andres			
		I	II	III_U	III_L
No. of wells	1	3	2	7	-
No. of Surveys	2	6	6	18	-
Avg k (mds.)	2	137	12	19	-

Based on the core analyses (considering both arithmetically and geometrically averaged values), buildup analyses and the average zonal permeabilities reported in the fieldwide study, the following reservoir-wide average permeabilities were assigned: Grayburg, 2.4 millidarcies; San Andres Zone I, 85 millidarcies; Zone II, 29 millidarcies; Zone III_U, 23 millidarcies and Zone III_L, 48 millidarcies. It is recognized that the permeability ranges are large within a zone but the above - stated averages are recorded in order to show apparent relative differences in permeabilities between zones. More significant are the observations that little permeability data are available and that which are available indicate large variations both vertically and areally. Also it should be kept in mind that drilling records often reflect a "cavernous" zone, usually in the lower portion of Zone I.

These differences suggest that water injection can best be controlled by careful selection of wells and by isolation of injection zones. The core data does provide a good indication of the degree of stratification and the use of these data for the evaluation of performance will be further explained in later sections.

RESERVOIR FLUID PROPERTIES

The PVT data reported by the previous Engineering Committee were used with one adjustment. The saturation pressure was changed from 1541 psig to 1500 psia on the basis of a subsurface oil sample in Amerada New Mexico State B-2 (Sec.29,G) taken on September 1, 1935. The formation volume factor curve was adjusted accordingly but the same initial solution gas-oil ratio (of 645 cubic feet per barrel of oil) was used.

For the sake of convenience and clarity the solution gas-oil ratio, oil formation volume factor, gas formation volume factor and oil viscosity trends are depicted as functions of pressure in Graphs 3 through 6.

ORIGINAL OIL AND GAS IN PLACE

The original hydrocarbons-in-place have been determined to be 54 BCF of gas in gas caps and 578 million stock tank barrels of oil. The breakdown of these amounts by zone together with other pertinent data are shown in Table 7.

These original in-place values were derived from the four Grayburg net pay isopach maps (Figures 8-11) and the five San Andres porosity-feet (ϕh) maps (Figures 22-26). An average porosity of 14 percent and average connate water saturation of 30 percent was used for the Grayburg whereas all of the San Andres zones were assigned a connate water saturation of 22 percent.

The tract values of original hydrocarbons-in-place were determined by a "gridding" technique using a ten-acre grid. (The results are summarized in (Tables 8 thru 13.) Copies of all maps and tabulations with tract values assigned, were submitted to the Technical Committee representatives of all lease operators for verification.

The fluid contacts used are the same as in the prior report: gas-oil contact at 360 feet subsea and oil-water contact at 614 feet subsea. It should be noted, however, that the "oil-water" contact is in reality the top of the transition zone and is based on the deepest depth from which clean oil was initially produced. Three of the current producers, Exxon Bowers A 35(29D), Getty Hardin 4(19A) and Shell Sanger 6(27D), have intervals open to production that are considerably below 614 feet subsea. It is believed, however, that no significant bottom water influx has occurred and none is expected.

PRIMARY PRODUCTION PERFORMANCE TO DATE

Cumulative oil production to January 1, 1977 is 167,008,194 barrels from the proposed Unit Area. Reliable cumulative values are not available for gas and water but it is estimated that for the entire field the cumulative GOR is about 1950 cubic feet per barrel and the cumulative WOR is about 0.75 barrels of water per barrel of oil produced. During 1976 the wells located in the proposed unit area produced an average of 7488 barrels of oil per day at a GOR of 2758 cubic feet per barrel and a water cut of 68 percent. The historical production performance is depicted in Graphs 1 and 1A for the entire Grayburg-San Andres reservoir complex and in Graph 1B for that portion attributed to wells that are included in the proposed North Unit.

It should be noted that 30 percent of the total oil produced to date was obtained prior to 1936, at rates which were about three times greater than any subsequent rate (Refer to Graph 1). It is also of interest that wells in the proposed North Unit Area have produced more than 73 percent of the cumulative oil and now contribute more than 80 percent of the field's current oil production rate. There are currently 24 top allowable producers in the field; 23 of these are located in this study area.

The productivity of wells completed in Zone I has always been significantly greater than those completed in other zones. Seven of the eight Shell McKinley lease wells (Section 19) continued to produce large volumes of water (greater than 100 BWPD) after being recompleted out of Zone I. Extensive surveying of these wells (radioactive tracer, temperature and spinner surveys) established that the water production was coming from Zone I via behind pipe communication despite repeated attempts to squeeze off production from that zone. Similar observations on other leases, coupled with the knowledge that the usual liner recompletion afforded little shut off protection from a zone that was known to be at a higher pressure than the others and was experiencing a moderately strong water influx, led to the conclusion that most of the field's water production is coming from Zone I. This premise is supported by the fact that a reasonable current water cut map can be constructed for only Zone I. These data for the lower San Andres zones are scattered and erratic, but usually coincide with the Zone I values. Furthermore, in several other instances (i.e., Amerada McKinley 4, 30E) the results of selective testing of wells indicate that in many cases the high water productivity is associated with only the high permeability (cavernous) streak in the lower portion of Zone I. Consequently, the Technical Committee has concluded that all water production in excess of 100 barrels per day is coming from Zone I.

In order to gain additional insight into an understanding of performance to date, the completion history of each well in the field was traced and a chronological allocation of production by zones was made for each well. The basis for estimating a well's production from each completed zone was on the ratio of Øh open to production; permeability-thickness was also considered when the Grayburg formation was involved in the multi-zone completion. This analysis yielded the

following cumulative oil production as of January 1, 1976: Grayburg 10.0 million barrels, San Andres Zone I 58.6 million barrels, Zone II 57.3 million barrels, Zone III_U 30.6 million barrels and Zone III_L 7.8 million barrels. These values are approximate and were not used but do indicate which zones could have had the greatest withdrawals.

Wells which are thought to be effectively completed in only one zone were grouped and analyzed in order to determine if there were any indicated differences in the current producing characteristics of the various zones. This analysis resulted in the following estimates:

Zone	GOR $ft.^3/BO$	WC %
Grayburg	5100	<10%
S.A. I	1800	66%
S.A. II	3400	32%
S.A. III_U	4100	21%
S.A. III_L	2700	15%

BOTTOM HOLE PRESSURE PERFORMANCE

Annual key-well static BHP surveys have been taken since October, 1930. The measurements were taken in flowing wells with a shut in time of 24 hours and adjusted to a subsea datum of 400 feet. The number of surveys greatly diminished after 1953 and the spread between measured values gradually increased and became less indicative of actual reservoir pressure as the gas saturation increased. Nonetheless all of these data were reviewed and are plotted in Graph 7 where the arithmetic averages, minimum and maximum values for the field, northern and southern areas, are shown. These data are considered to be of little value after the year 1947, inasmuch as the 24-hour shut in time is insufficient to record

actual reservoir pressures. Furthermore, these surveys were taken in wells regardless of zone or multiplicity of completion.

A much more definitive analysis is possible by using BHP buildup data. Only Shell Oil Company took this type of survey; the areal coverage therefore is greatly restricted. Horner type analyses were made of 96 buildup surveys which were obtained in 31 wells. The values of P*, $\bar{P}$, kh, skin and P.I. were calculated and compared for consistency and reasonableness with other surveys in the same wells and with what the reservoir pressure was estimated to be at that time. These calculations were chronologically segregated by zone of completion. Only 29 surveys taken in 10 wells are considered to be representative of single zone performance. Fourteen flow tests of 13 Shell wells were also available and useful for estimating productivity indices. In addition the Technical Committee in late 1974 requested and obtained four special buildup surveys with the cooperation of the operators.

Analyses of all of the aforementioned BHP surveys led to the following conclusions:

1. Reservoir pressure is greater in the North Unit Area than in the rest of the field.
2. The useable BHP buildup data are sparse but clearly indicate significant reservoir pressure differences between the Grayburg, San Andres Zone I, Zone II, and III_U-III_L. This is strong evidence that these zones, at least in the North Unit area, are effectively separated and are behaving as different reservoirs.
3. Average reservoir pressure at January 1, 1975, in the North Unit Area, are: Grayburg 400 psig, San Andres Zone I 950 psig, Zone II 870 psig and Zones III_U and III_L 740 psig. The pressure performance, as a function of time, for each of these reservoirs is depicted on Graph 8.

4. Apparently there are no significant pressure gradients within any zone in the North Unit Area.

It should be noted that the four operators which cooperated with the Technical Committee in obtaining special buildup surveys in December, 1974, were advised that every effort would be made to ascertain the amount and make adjustments for any production "lost" to them as a consequence of these operations. These surveys are summarized as follows:

Well	Location	Date Of Survey	Hours SI	Estimated Amount of "Lost" Production (Bbls)
Amerada McKirley 3	30C	1/05/75	67	240
Exxon Fed. Bow. A-10	29L	12/30/74	70	200
Getty McKinley 2	30H	12/13/74	72	0
Marathon Sec. 30 1	30K	12/02/74	67	589

The cumulative oil production shown in the parameter tables have been increased to include the above amounts.

CURRENT OIL AND GAS IN PLACE

The current hydrocarbons-in-place value, by tracts, provides a method for assessing the relative value of each lease to the unit. Distinctions are made on the basis of saturation and storage volume differences. In this analysis tract saturations have been assessed by the use of fractional flow equations, relative permeability curves and current production characteristics.

The Technical Committee constructed a water cut map for Zone I and GOR maps for Zones II, III_U and III_L. These maps were based primarily on data obtained from the 1974 annual GOR tests. It was concluded that there is a moderately strong water influx through Zone I only. All other reservoirs are being produced by solution gas drive (and gas cap expansion in the Grayburg) and there is no

evidence of bottom water encroachment in the North Unit area. Unquestionably there has been localized movement of water into all the other zones by communication with Zone I (behind pipe and due to lack of natural separation between Zones I and II in certain areas). However, it is felt that this invasion of water can be likened to a dump flood in certain portions of the field and cannot be quantified by tracts but rather should be handled as a reservoir average. This thesis is supported by both the differences found in zonal pressures over a large time interval and the fact that most of the water production obtained from non-Zone I completions can be traced directly or indirectly to Zone I.

The most reliable source of GOR and water cut data was judged to be the 1974 Annual GOR tests which were witnessed by Conservation Commission representatives. These data were mapped and contoured. Consideration was given to the current completion interval and results of workovers. An example of this is Amerada McKinley 4(30E) which is completed in the Grayburg and Upper Zone I and produced clean oil during the 1974 State Test. However, this well had produced at about 89 percent water cut in January 1973, when Amerada raised an open hole packer six feet up the hole, thereby removing the lower high porosity portion of Zone I from production and effecting a clean oil completion. Consequently the 1974 State Test control point was ignored and this area's water cut contour reflect instead neighboring control points. Figure 27 is the resulting map. Tract values of average water saturations were interpolated by superimposing a ten-acre grid system. These values were considered to be representative of January 1, 1975 conditions.

In a similar manner the GOR maps were constructed for each of the three lower San Andres zones; these are depicted in Figures 28, 29 and 30. Inasmuch as these maps are less definitive, the tract values were interpolated by using a forty-acre grid system.

As previously discussed (RESERVOIR ROCK PROPERTIES section), the Dykstra-Parsons variance factors were determined from core analyses and average values found to be 0.7 for the Grayburg (20 cores) and 0.8 for the San Andres. This is a qualitative indication of vertical heterogenity or degree of stratification of the net pay. These data were used in the following manner: assuming five layers, the permeability value for each layer was determined by the use of the plots shown in Graphs 9 and 10. The "rock" relative permeability curves published by the previous Engineering Committee were "stratified" into the five layers and the "before" and "after" water-oil relative permeability curves are shown for each formation in Graphs 11 and 12. The producing water cut as a function of water saturation and the producing GOR as a function of gas saturation were calculated with the fractional flow equations and the results are shown in Graphs 13 through 16. It was planned that these relationships, using the "stratified" curves, could then be applied to each tract to determine the current hydrocarbons-in-place. This is basically the same technique that was used in the previous fieldwide Engineering Committee study. However, subsequent work indicated that current conditions and future production performance, by well zone, could better be estimated with the use of a reservoir simulation study.

ULTIMATE PRIMARY RECOVERY

Grayburg &/or Upper San Andres Stringers

There are currently 78 wells which are completed only in the Grayburg and/or Upper San Andres stringers. Most of these wells are located on the flanks of the structure and their locations are shown on Figure 31. These wells are primarily characterized by marginal production, high gas-oil ratios and little or no water production.

The primary oil reserves from these completions (as of January 1, 1977) are estimated to be 1,485,275 barrels. These determinations were based on extrapolations of recent production performance (five-year period between January 1, 1972 and December 31, 1976). The economic limit was assumed to be one barrel of oil per day per well. The individual reserve estimates are summarized on Table 14 and the corresponding production graphs, showing the extrapolated trends, are enclosed under the section labeled "DECLINE CURVES."

As pointed out in the previous discussions, the Grayburg reservoirs are smaller in volume, lower in permeability and lower in current reservoir pressure than the more prolific San Andres reservoirs. Nonetheless the Grayburg represents a valuable asset to the unit and is currently developed by 57 active single zone "Grayburg only" wells and 62 Grayburg plus San Andres active completions.

Because of the significant amount of commingled (Grayburg with San Andres) production it is difficult to estimate actual amounts produced from each zone. However, it is believed that a reasonable definition has been made with the use of a reservoir simulation study of a 40-acre symmetry element. The average reservoir, fluid and producing characteristics of the Grayburg were determined from those wells that were considered to be currently producing from the Grayburg

only. The estimates for January 1, 1975 were 15 BOPD per well with a GOR of 5035 cubic feet per barrel. Fractional flow equations were used in conjunction with pseudo relative permeability curves to relate this GOR to an average gas saturation of 19 percent and an average oil saturation of 51 percent. The pseudo relative permeability curves were constructed using a Dykstra-Parsons variance factor of 0.7 (determined from 256 core samples) and a five-layer stratification. (See Graphs 9, 11, 13 and 15). The average reservoir pressure at January 1, 1975 was estimated to be 400 psig at 400 feet subsea.

The ultimate primary recovery (to an economic limit of one BOPD per well) was computed to be 109 STB per NAF or 18.7 percent of the original oil in place. This recovery efficiency applied to the entire Grayburg volume underlying the proposed unit area is equivalent to an ultimate primary recovery of 11,500,000 barrels of oil. The primary reserves (estimated by decline curve analysis) of 1.5 million barrels indicates that the Grayburg has produced about 10 million barrels of oil to date and is in an advanced stage of depletion (87 percent).

San Andres (Main Zones)

Attempts to form a fieldwide unit were aborted during 1973, primarily because of disagreement over the determination of remaining primary reserves in the main San Andres zones. The main complication for determining tract primary reserves is the existence of a strong water influx into the upper San Andres (Zone I). This water drive is primarily from the west to east; has caused an unusually large amount of oil migration and has maintained the reservoir pressure (and consequently the productivity) of Zone I at higher levels than in the other productive intervals. This is particularly evident along the eastern flank of the proposed North Unit area where the combined cumulative oil production for seven flank leases significantly exceeds the total of their original oil in place.

Two arithmetic approximation methods for allocating tract primary reserves for the San Andres were rejected by the Technical Committee. Subsequent discussions led to the conclusion that the problem would best be resolved with the use of a reservoir simulation study. Consequently Shell made a feasibility study and determined that such a study could be made with an in-house three-dimensional, three phase compressible fluid reservoir simulation program. A 10 by 20 grid system, depicted in Figure 32, was superimposed on all completions in the field using a three-layer representation for the San Andres reservoirs (I, II and III_U/III_L). Only the upper zone has a significant aquifer attached. All of the Technical Committee data were used for the reservoir description of the acreage located in Township 18 South and the reservoir description of the acreage located in Township 19 South was based on the prior published Engineering Report. These include: structure maps (fitted with curvilinear coordinates for a smooth surface as shown in Figure 33), individual well zonal porosity determinations, zonal original hydrocarbons in place and rock relative permeability curves modified to pseudo curves to account for stratification effects.

Oil production history, from initial completion to January 1, 1976, was input for every completion in the field after factoring out a minor amount attributed to the Grayburg formation on the basis of relative permeabilities and hydrocarbon storage differences in the completed intervals. The actual well completion history (zone changes) and production were input in five-year intervals from initial completion thru the year 1971, then the next 3 years, 1 year, eight months and then one year for production through August 31, 1976. As previously decided by the Technical Committee, all wells producing in excess of 100 BWPD but not completed in Zone I were assumed to have behind pipe communication with that zone and thus were treated as having completions in Zone I as well as in their recorded zones.

As noted in the Geology section, there are many indications of preferential flow channels. One obvious example is between the two wells 29P and 28M. Although these wells are located about 700 feet apart and are both apparently completed in equivalent Zone I sections, one is a clean oil producer and the other makes in excess of 70 percent water cut. In view of this and other anomalous production data, it was necessary to establish flow channels (in Zone I only) in order to obtain a satisfactory history match. The transmissibilities of these flow channel boundaries were varied but it was found necessary to use a value of zero for all boundaries. The locations of these flow channels or barrier positions are shown in Figure 34. Also shown are the "windows" between Zones I and II where no natural separation occurs.

To evaluate the quality of the history match, the calculated 1975 zonal water production rates for each well were compared to those reported to the New Mexico Conservation Commission during the year 1975. Attention was also focused on current GOR and zonal and areal reservoir pressure variations. Once a satisfactory history match was obtained, a production prediction was made starting at September 1, 1976. A summary of these tract reserves and equities was transmitted to all Operators with letter dated November 10, 1976.

Assumptions used for the prediction run by the Technical Committee were:

1. Each well retained the current (1976) completion interval throughout its remaining life.
2. A top allowable well was assigned a bottom hole producing pressure of 300 psi at the start of the prediction run whereas all other wells were assumed to have a producing bottom hole pressure of 100 psi.

3. The permeability-thickness product of each zone in each completion had been automatically varied throughout the history match in order to simulate actual performance (varying skin, etc.). The last adjusted zonal kh (based on the actual producing rates during the prior 12 months) for each completion was kept constant throughout the prediction mode. Thus a smooth transition between historical oil rate and the predicted values was assured.
4. The well economic limit was 3 BOPD or 99 percent water cut and the prediction was terminated at end of the year 2024.
5. It was assumed that those wells which contain a Grayburg completion with the main San Andres would not obtain any future primary reserves from the Grayburg because of the significant differences in permeability-thickness products and static reservoir pressures.

The predicted performance of each well was then summed into lease, operator and field totals. The Technical Committee approved a manual adjustment to the computed Zone I primary oil reserves for five directly offsetting wells located on the eastern flank in order to correct for an anomaly in misalignment of the simulator grid in that zone. These wells are: Getty Turner 1 (34F) and Turner 2 (34 C), Shell Turner 1 (34G) and Turner 2 (34B) and Shell Sanger 2 (27N); the computed Zone I oil reserves were equally distributed and is 416,437 barrels per well.

It should be noted that the tract primary oil reserve (as of January 1, 1977) which are summarized in Table 15 are based on a predict mode from actual production through August 31, 1976. The update to January 1, 1977, was done by a simple subtraction of actual production of the ensuing four months. The zonal allocation for each tract's actual production during the last four months of 1976

for this update was based on the allocation made by the simulation program for the first four months of the predict mode.

SECONDARY RECOVERY

The secondary recovery potential for the proposed unit has been evaluated for water injection operations.

Grayburg

The evaluation of the secondary recovery potential by water injection was based on a reservoir simulation study of a 40-acre symmetry element. These results are detailed in the minutes of the March 25, 1976 Technical Committee meeting.

The most significant conclusions derived from the model study are:

1. Because of the low permeability it is necessary to use a pressurized water injection system (1500 psig surface) and a five-spot waterflood pattern. All water injection will be done at less than fracture pressures.
2. Primary ultimate recovery efficiency is 18.7 percent and secondary oil recovery efficiency is 14.4 percent for a symmetrical closed 80-acre five-spot pattern.
3. An 80-acre five-spot pattern waterflood, using existing wells, is economically attractive but will have a long life (36 years) and a relatively low oil response rate. A complete infill drilling program to convert to 40-acre five-spot patterns cannot be economically justified under current oil pricing guidelines.

The model study was based on average reservoir and production characteristics and is described in the "ULTIMATE PRIMARY RECOVERY" section. It was assumed that

water injection would be initiated when the average reservoir pressure would be 220 psig and average oil saturation at that time would be 48.6 percent. The residual oil saturation in the swept zone was assumed to be 35 percent and the sweep efficiency is calculated to be 85 percent.

Application of the results of the reservoir model study to unit-wide operations is based on two published methods: (1) Caudle et al, Petroleum Transactions, AIME (1955) 204, pages 79-85 and (2) the Forrest F. Craig, Jr. SPE Monograph Volume 3, The Reservoir Engineering Aspects of Waterflooding, Chapter 5. The work by Caudle et al indicated that encroachment of injected water beyond the normal well pattern could be approximated by applying a 90 percent efficiency to the area lying outside the last row of wells and within a distance of one well spacing of these wells. The work reported by Craig was used to modify the expected recovery efficiency for incomplete patterns in the North Hobbs Unit. The secondary oil recovery from the Grayburg was therefore calculated on the basis of the following recovery efficiencies: 14.4 percent for closed nearly-symmetrical patterns, 13.4 percent for 3/4 pattern, 12.3 percent for 1/2 of a five-spot and 10.9 percent for reasonably-spaced direct offsets. Consequently the calculated volume of secondary oil reserves for the proposed unit is 6,560,000 barrels for an average recovery efficiency of 10.6 percent of the original oil-in-place. This is equivalent to a secondary reserve to primary ultimate recovery ratio of 0.57 and requires the drilling of one injector at location 29D. Additional drilling for water injectors at selected locations was investigated but could not be justified economically.

The recommended five-spot water injection pattern is depicted on Figures 35 (Upper Zone) and 36 (Lower Zone) and consists of 40 injectors and 44 producers. The forecasted production function for recovery of the 6,560,000

barrels of secondary oil plus the remaining primary reserves is shown in Graph 17. This estimate is dependent on obtaining average water injection rates of 260 BWPD per injector during fillup (5 years) and 125 BWPD afterwards. The total water injection requirement is about 90 million barrels, of which 35 million barrels is makeup water. The peak oil production rate of 1298 barrels of oil per day (average of 30 BOPD per producer) is expected after ten years of water injection. Water breakthrough should rapidly follow oil response and average 80 percent watercut throughout most of the flood life. The final cumulative produced water-oil ratio is 8.3 to 1. The results of additional computer runs indicate that the oil production response could be enhanced (greater response and higher ultimate oil recovery) by shutting-in all Grayburg producers during the fillup period in order to conserve reservoir energy. This is attributed to the fact that a significant portion of the free gas volumes can be trapped with this approach and thereby reduce the residual oil saturation to water flooding.

San Andres

The Technical Committee concluded that the San Andres secondary recovery potential should be determined by analogy with existing San Andres waterfloods in the vicinity of Hobbs that exhibited similar reservoir characteristics.

Performance data on eight such projects were reviewed and volumetrically averaged (on the basis of original oil in place) and reflected an ultimate recovery efficiency of 35 percent with a secondary to primary recovery ratio of 0.85. These floods had been in operation for a reasonable period of time and the cumulative production had already exceeded 60 percent of the total expected volumes. The volumetrically weighted permeability for these projects was 11 millidarcies; only two of the projects had average permeabilities as high as

the North Hobbs Unit average for Zones II, III_U and III_L (28 millidarcies). The ultimate recovery efficiency for those two units are predicted to be 39.4 and 46.4 percent with secondary to primary ultimate recovery ratios of 0.43 and 0.68.

A reservoir simulation study was made on the total Zone III_L reservoir and resulted in a primary recovery efficiency of 24 percent and a secondary recovery efficiency of 20 percent using a modified inverted nine-spot injection pattern. This ultimate recovery efficiency of 44 percent is equivalent to a secondary to primary ratio of 0.82. A residual oil saturation of 35 percent in the swept zone was used in this computer study and the final average residual oil saturation of 39 percent is equivalent to a volumetric sweep efficiency of 89 percent.

Based on the foregoing the Technical Committee determined that the ultimate oil recovery efficiency for the San Andres Zones II, III_U and III_L will be 40 percent. This will result in a secondary recovery reserve for these zones of 48,640,000 barrels of oil. These recoveries are equivalent to an average residual oil saturation of 41.4 percent and a sweep efficiency of 85.1 percent. Tract secondary reserves were allocated on the basis of original oil in place for each of the three zones.

The recommended water injection patterns for each of the three San Andres reservoirs are inverted nine-spot injection patterns (approximately 160-acre spacing) and are shown on Figures 37, 38 and 39. There are 27-1/2 unit injectors (60 well zones) and 116 unit producers (192 well zones). The injectors are selected on the basis of both location and evidence of non-communication, behind pipe, with Zone I. These configurations will require the drilling of five (2-1/2 unit) injectors, along the common boundary with the Amoco-operated South Hobbs Unit; and twelve interior injectors; and five producers. The resulting

expected production function is shown in Graph 18 and is based on the forecasts obtained from the computer study. The expected waterflood recovery of 61.9 million barrels of oil (48.6 secondary and 13.3 primary) should be recovered in 35 years with the peak oil production rate of 9280 barrels of oil per day (average of 80 BOPD per producer) occurring 8 years after the start of water injection and remaining flat for seven years. This prediction is based on an average water injection rate of 2000 barrels per day per injection well during fill up (160 million barrels) and a total water injection requirement of 550 million barrels (80 million barrels makeup volume). The cumulative produced water-oil ratio is expected to be 5 to 1.

The ultimate oil recoveries (both primary and secondary) for each producing zone in the proposed unit area are summarized in Table 16.

Water Source

It is recommended that all makeup water requirements be obtained from the City of Hobbs industrial process water source (filtered sewage effluent). This is the same source that is currently being used by the South Hobbs Unit and is also scheduled to supply the Continental Warren McKee Pool waterflood. Shell, on the behalf of the proposed North Hobbs Unit, presented a letter on August 19, 1976, to the Hobbs Public Works Board requesting an option to purchase water from the City. The Board agreed to the option request and has agreed that the priorities for this supply be set in the same sequence as the initial contact with the City was made Amoco South Hobbs Unit, Continental flood and the Shell North Hobbs Unit. In return the City requested an annual review of future water requirements and a base contract period of five years. The initial purchase price is 1.5 cents per barrel (42 gallons) plus a five percent sales tax.

The total water availability from the City of Hobbs appears to be adequate for currently recognized projects. There is approximately 95,000 barrels per day of treated effluent available now with an estimated additional 35,000 barrels per day available from shallow contaminated underground water adjacent to the treating plant. The estimated average water requirements over the first five years of the three aforementioned projects are as follows:

Project	Make Up Water Requirements
So. Hobbs Unit	33,000 BWPD
Continental	15,000
No. Hobbs Unit	40,000
Totals	88,000 BWPD

ECONOMICS

Capital Investments and Related Costs

The estimated capital investment required to conduct the water injection program, described in the preceding section, is $24,600,000. This amount includes: $11,000,000 for centralized production facilities with fourteen satellite stations, $7,000,000 for the pressurized injection system, $6,000,000 for well work (drilling new wells, conversions to injection, restoring TA wells and larger volume artificial lift equipment) and $600,000 for the source water gathering system. These amounts are based on the assumption that water injection will be commenced in mid-1979. A more detailed breakdown of these costs are listed in Table 17.

A more accurate determination of costs will be made when: the final waterflood plan is designed (a function of well availability and performance), contract bids are received (inflation, timing and design) and additional studies are made to improve the design and locations of injection and production stations (scheduled for the last half of 1977). However, the estimates presented are considered to be reasonable values based on a significant amount of detailed work and are valid for purposes of evaluating the unit waterflood economics.

The related costs include: normal direct operating, remedial work, well conversions, water handling and makeup water purchase. These expenses are summarized in Table 18 (Grayburg Waterflood) and Table 19 (San Andres Waterflood). The normal direct operating costs are based on information obtained from various operators' experience during the year 1975 on 32 Grayburg, 76 low volume San Andres and 26 high volume San Andres wells.

Profitability Analysis

The differential profitability analysis for waterflood operations in the Basal Grayburg and San Andres Zones II, III_U and III_L is summarized as follows:

	Primary Recovery	Primary Plus Secondary	Secondary Recovery
Reserves - MMB (1/1/79)			
Grayburg	1.0	7.6	6.6
San Andres III, III_U, III_L	13.3	61.9	48.6
Total	14.3	69.5	55.2
Capital Investment - MM$			
1979	0	23.6	23.6
1984 - 1999	0	1.0	1.0
Total	0	24.6	24.6
Profitability - MM$ (Before FIT)			
Profit Undiscounted - $	32.7	367.1	334.4
- (%)	-	(1492)	(1359)
Profit Discounted @ 10% - $	17.1	97.0	79.9
- (%)	-	(425)	(350)
Payout Time - Yrs.			6.0
Earning Power - %			27.6

This analysis is based on constant dollars (no inflation after 1979) and constant revenue (no price escalation). The oil revenue was based on the following pricing categories: stripper oil - $13.00 per barrel; Upper Tier oil - $11.40 per barrel, Lower Tier oil - $5.20 per barrel and gas - $0.37 per MCF. The Grayburg revenue averaged $11.40 per barrel of oil for both the waterflood and continued primary operations. The San Andres revenue averaged $8.50 per barrel of oil for secondary recovery operations.

An attempt was made to evaluate the contribution of the Grayburg secondary recovery operations. For these purposes it was estimated that the additional capital investment requirements would be $4,200,000 (17 percent of the total cost). This amount is considered to be high side because the different waterflood response times will tend to smooth the peak requirements of produced and injected volumes and therefore not increase the capital and operating costs by the direct ratios of volumes. Nonetheless, with constant revenue, the undiscounted profit from the Grayburg contribution is about $33,000,000 and the discounted profit (at a 10% rate) exceeds $6,000,000. Rather than attempt to refine these values it was assumed that these economics are sufficiently attractive to warrant the extension of facilities to include the Grayburg waterflood operations.

It is interesting to note that the adjacent Moranco waterflood projects (Rice Lease in Section 13 and Hardin Lease in Section 18) are apparently experiencing response to water injection as evidenced by increasing oil production rates and gas-oil ratio decreases with no reported water production through the end of 1976. Water injection was started into the Rice lease in August 1971 and into the Hardin lease in April 1974. A total of 507,807 barrels had been injected into three wells by the end of 1976. The 1974 oil production rate from both leases averaged 20 barrels per day with a gas-oil ratio of 9952 cubic feet per barrel. Comparable averages for 1976 are 38 barrels per day with a gas-oil ratio of 4835 cubic feet per barrel.

UNITIZATION PARAMETERS

Definition of Unitized Formation

The unitized formation shall mean that subsurface portion of the unit area known as the Grayburg and San Andres formation of Permian Age and located in the stratigraphic interval between the depths of 3698 feet and 5347 feet as measured on the Borehole Compensated Sonic-Gamma Ray Log run in Shell Oil Company State A-7 on July 9, 1969. This well is located 1930 feet FNL and 660 feet FEL of Section 32-T18S-R38E, Lea County, New Mexico. The unitized interval thus defined is depicted in Figure 40.

Description of Unitization Parameters

The tract locations and working interest ownerships are shown in Table 20. Each working interest owner should verify the equities shown.

Parameters for possible use in unitization formulae have been determined and are tabulated in Tables 21, 22, 23 and 24. The tract values are listed in the "A" version, 21A, 22A, 23A and 24A, whereas the working interest owner values are listed in the "B" version, 21B, 22B, 23B and 24B. A brief discussion of each parameter is as follows:

Table 21

1. USEABLE COMPLETIONS - Wells that are now producing or that have produced from the Grayburg - San Andres and are available for unit use.
2. ACTIVE PRODUCING WELLS - As of January 1, 1977.
3. CUMULATIVE OIL PRODUCTION - As of January 1, 1977. These are based on values published in the "Annual Report of the New Mexico Oil & Gas Engineering Committee" as of January 1, 1976. The next twelve months' production reported in the Monthly Statistical Report have been added. They reflect the production from each proration unit irrespective of

number of wells and operator. A small amount (1029 barrels) has been added to three wells to adjust for shut in time during special BHP surveys requested by the Technical Committee.

4. CURRENT OIL PRODUCTION - Year 1976 (As shown in Monthly Statistical Report compiled and edited by New Mexico Oil Conservation Commission).
5. CURRENT GAS PRODUCTION - Year 1976 (Same source as Number 4).
6. ORIGINAL GAS CAP GAS IN PLACE - Basal Grayburg - Upper Zone.
7. ORIGINAL GAS CAP GAS IN PLACE - Basal Grayburg - Lower Zone.
8. ORIGINAL GAS CAP GAS IN PLACE - Basal Grayburg Totals.
9. ORIGINAL GAS CAP GAS IN PLACE - San Andres Zone I.
10. ORIGINAL GAS CAP GAS IN PLACE - Total Unit.

Table 22

1. PRODUCTIVE ACRES - All acreage originally productive in the Grayburg - San Andres reservoirs (above 614 feet subsea).
2. ORIGINAL OIL IN PLACE - Basal Grayburg, Upper Zone.
3. ORIGINAL OIL IN PLACE - Basal Grayburg, Lower Zone.
4. ORIGINAL OIL IN PLACE - Basal Grayburg, Totals.
5. ORIGINAL OIL IN PLACE - San Andres, Zone I
6. ORIGINAL OIL IN PLACE - San Andres, Zone II
7. ORIGINAL OIL IN PLACE - San Andres, Zone III_U
8. ORIGINAL OIL IN PLACE - San Andres, Zone III_L
9. ORIGINAL OIL IN PLACE - San Andres, Totals
10. ORIGINAL OIL IN PLACE - Total Unit

All of the original hydrocarbon in place determinations are detailed, by proration units, in Tables 8 thru 13.

Table 23

1. PRIMARY OIL RESERVES - GRAYBURG - As of January 1, 1977. Represents the values determined by analysis of decline curves (see Graphs 19-1 to 36) of wells which were considered to be producing from the Basal Grayburg and/or upper San Andres stringers.
2. PRIMARY OIL RESERVES, San Andres Zone I
3. PRIMARY OIL RESERVES, San Andres Zone II
4. PRIMARY OIL RESERVES, San Andres Zone III (Upper and Lower Zones Combined).
5. PRIMARY OIL RESERVES, San Andres Totals
6. PRIMARY OIL RESERVES, Total Unit
7. Ultimate Primary Oil Recovery

The primary oil reserves for the San Andres zones are based on a detailed reservoir simulation study and excludes those wells considered in the decline analysis group (Item 1).

Table 24

1. SECONDARY OIL RESERVES, Grayburg
2. SECONDARY OIL RESERVES, San Andres - Zone II
3. SECONDARY OIL RESERVES, San Andres - Zone III_U
4. SECONDARY OIL RESERVES, San Andres - Zone III_L
5. SECONDARY OIL RESERVES, Total San Andres
6. SECONDARY OIL RESERVES, Total Unit

The tract values for each of these parameters is based on the tracts' percent of original oil in place for each zone considered.

TABULATIONS

TABLE 1

PROPOSED NORTH HOBBS (GRAYBURG - SAN ANDRES) UNIT

WORKING INTEREST OWNERS' CHARGE TO THE TECHNICAL COMMITTEE

A. Construct an acceptable base map.

B. Define the vertical interval to be unitized.

C. Recommend a Unit Area or areas.

D. Determine feasibility of waterflooding the Grayburg.

1. Construct Grayburg net pay map and (net Øh, if possible).
2. Determine floodable net acre feet.
3. Determine secondary oil potential.

E. Determine feasibility of waterflooding the San Andres.

1. Review Øh maps.
2. Review GOR and water-cut maps.
3. Construct continuous pay maps by zone.
4. Determine remaining primary production.
5. Establish secondary oil potential by zones.

F. Tabulate the following parameters by tract, by zones, and by Working Interest Owners:

1. Current oil and gas production rate and value for the most recent representative period.
2. Cumulative oil production.
3. Usable completions.
4. Active producing wells.
5. Total acres.
6. Original oil in place.
7. Floodable net acre-feet.
8. Remaining Primary Reserves.
9. Ultimate Primary Oil.
10. Secondary reserves.
11. Any other parameter considered appropriate by the Engineering Subcommittee.

G. Develop recommended plans of depletion including economic comparisons versus continued primary operations.

TABLE 17

WATERFLOOD CAPITAL INVESTMENT REQUIERMENTS

I. INJECTION SYSTEM (60,000 BWPD @ 1500 PSIG SURFACE)	
A. Injection Station	
3 Centrifugal Pumps	$ 300,000
3 ∿ 6000 Bbl. Welded Tanks	290,000
Misc. Controllers, Meters, Bldg, Etc.	470,000
Piping, Valves, Fittings	390,000
Labor (Mechanical Inst.)	330,000
Taxes, Transportation, Contingencies	320,000
Subtotal	$ 2,100,000
B. Injection Lines	
270,000' of 3" Line Pipe, Cement Lined	$ 1,100,000
40,000' of 6' Line Pipe, Cement Lined	330,000
13,000' of 8' Line Pipe, Cement Lined	150,000
Labor	1,300,000
System Fittings, Crossings, ROW, Etc.	420,000
Taxes, Transportation, Contingencies	500,000
Subtotal	$ 3,800,000
C. Wellheads, and Manifolds	$ 1,100,000
INJECTION SYSTEM TOTALS	$ 7,000,000
II. PRODUCTION SYSTEM (185 WELLS, 15,000 BOPD & 70,000 BWPD)	
A. Two Central Tank Batteries	
4 ∿3000 Bbl. Welded Coated Tanks	$ 190,000
2 ∿10 ft. by 40 ft. FWKO	260,000
2 ∿10 ft. by 30 ft. Chemelectrics	210,000
LACT Units, Pumps, Transformers, Etc.	370,000
Misc. Pipe, Fittings, Valves	530,000
Labor, Dirt Work, Foundations, Etc.	660,000
Transportation, Taxes, Contingencies	380,000
Subtotal	$ 2,600,000
B. Fourteen New Satellite Stations	
185 Automatic Well Manifolds &.Valves	$ 740,000
14 ∿ 125# Analyzer Separator, Panels	740,000
28 Transfer Pumps, Controls, Fittings, Pipe	700,000
Labor	450,000
Transformers, Transportation, Taxes, Contingencies	470,000
Subtotal	$ 3,100,000
C. Gathering and Distribution Lines	
500,000' of 3" Line Pipe Coated	$ 2,200,000
6" Fiberglass, & Misc. Lines, ROW, Crossing	550,000
Labor	1,170,000
Fittings, Valves, Transportation, Taxes, Contingencies	780,000
Subtotal	$ 4,700,000
D. Additional Electrification	$ 600,000
PRODUCTION SYSTEM TOTALS	$11,000,000

III. SOURCE WATER GATHERING SYSTEM	
32,000' of 12" Class 200 Cement Asbestos Pipe	$ 250,000
Miscellaneous ROW, Damages, Crossing, Etc.	180,000
Transfer Pump, Bldg., Transportation, Taxes, Contingencies	170,000
SOURCE WATER GATHERING SYSTEM TOTALS	$ 600,000
IV. WELL WORK	
Drill and Equip 15½ Unit Injectors	$ 2,325,000
Drill and Equip 5 Producers	950,000
Convert 52 Wells To Injectors	988,000
Restore 19 TA Wells	342,000
Install 5 Large Pumping Units	250,000
Miscellaneous	145,000
WELL WORK TOTALS	$ 5,000,000
INITIAL CAPITAL INVESTMENT (I-IV)	$23,600,000
FUTURE CAPITAL INVESTMENT INSTALL 20 LARGE PUMPING UNIT (THRU 1999)	$ 1,000,000
ULTIMATE WATERFLOOD CAPITAL INVESTMENT	$24,600,000

Attention: George L. Carlson,
Division Production Manager

Re: Injection Pressure Increase
North Hobbs Grayburg-San Andres
Unit Well No. 13-331

Dear Mr. Carlson:

Your request for an increase in injection pressure in the subject well has been reviewed. After conferring with our Division Director, it was decided to allow Well No. 13-331 to inject at 800 psi (0.2 psi/ft to the uppermost injection interval). Injection at your requested pressure will be allowed provided the suggestion of the Division Supervisor of our Hobbs District Office be implemented. That suggestion being to abandon the unitized interval of the North Hobbs Unit Well No. 18-131 and monitor the recompleted upper portion of the salt section for any possible subsurface fluid movement. You shall consult the Hobbs District Supervisor in planning a monitoring schedule for Well No. 18-131.

Should any subsurface fluid movement be detected as a result of your periodic monitoring, injection into Well No. 13-331 shall cease immediately and the Hobbs District and this office shall be notified.

Should you have any questions, please call me at 827-5807.

Sincerely,

Gilbert P. Quintana

ATTN Mr. J. D. Ramey, Director
P. O. Box 2088
Santa Fe, NM 87501

Gentlemen:

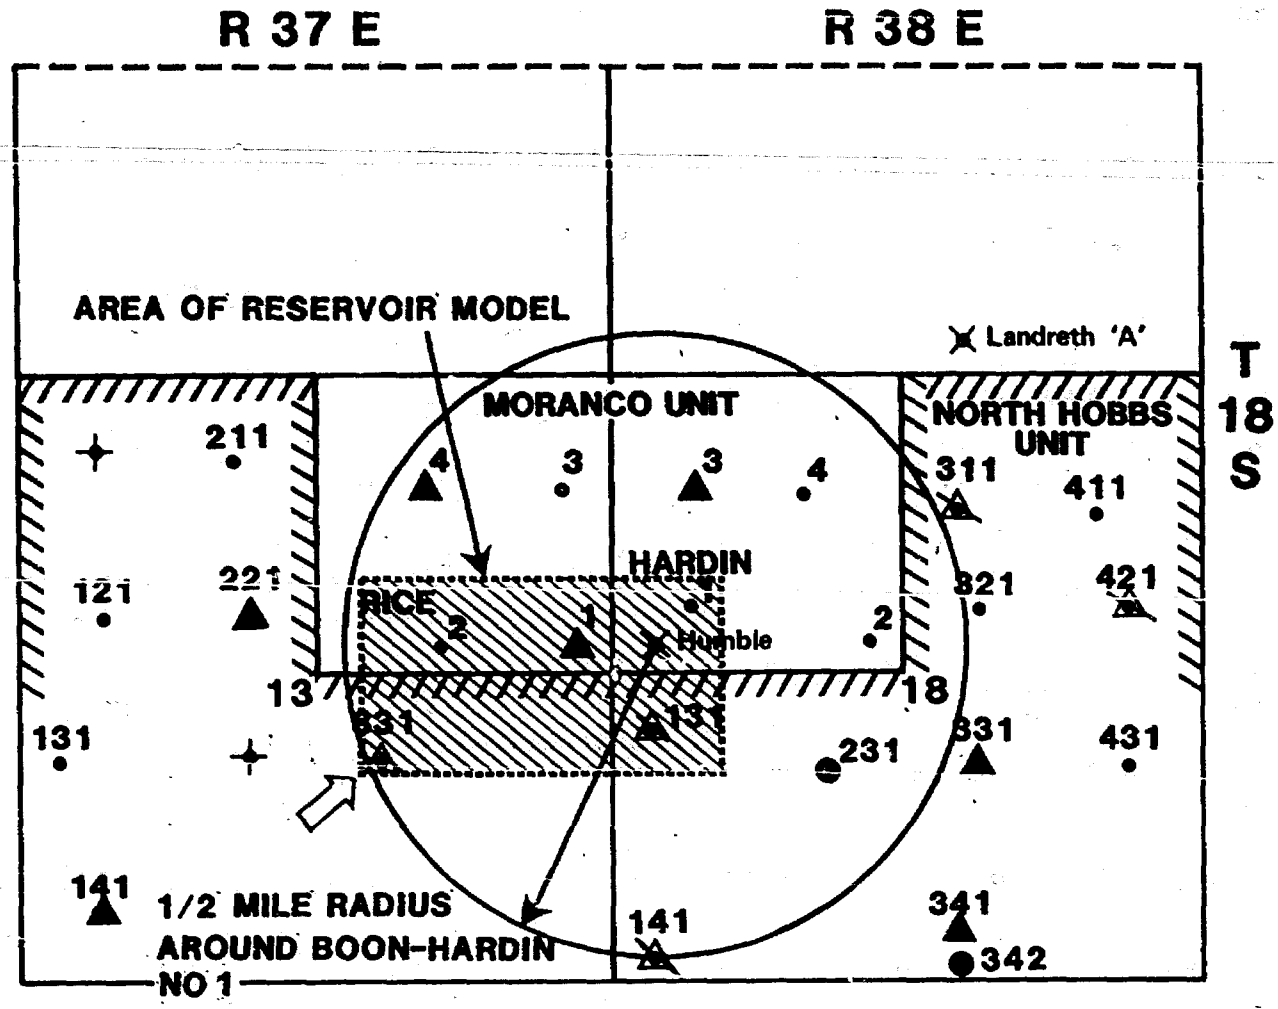
REQUEST TO INJECT AT GREATER THAN HYDROSTATIC PRESSURE IN NORTH HOBBS GRAYBURG-SAN ANDRES UNIT NO. 13-331

Shell, as operator of the North Hobbs Grayburg-San Andres Unit requests authority to inject into unit Well No. 13-331 with up to 800 psi tubing pressure (0.2 psi/ft to top injection zone). Injection is currently limited to hydrostatic pressure because this well lies within one-half mile of a non-unit well, the Humble-Boon Hardin No. 1, that we have been unable to plug and abandon in the prescribed manner. The relative location of these wells is shown in Figure 1.

The basis for this request is our simulation work using a model of the Grayburg reservoir as shown in Figure 2. Input for the model included the historical performance of both North Hobbs unit wells and the Moranco Rice-Hardin waterflood which was initiated in 1971. Figure 3 illustrates the model's history match and forecast of the bottomhole pressure in the vicinity of the Boon-Hardin well. This plot shows that increasing the injection pressure to 800 psi in No. 13-331 would have very little affect on the bottomhole pressure around the Boon-Hardin well. The model predicts that the pressure in the vicinity of the Boon-Hardin well will essentially level off at about 1300± psia, which is significantly below the 1730 psia pressure required to support a hydrostatic head of water to the surface.

Some variations from model predictions can be expected because of changing well conditions and unforeseen circumstances. Therefore, as suggested by the Division Supervisor of the Hobbs District, North Hobbs Unit Well No. 18-131 will be abandoned in the unitized interval and be re-completed opposite the upper portion of the salt section to monitor possible subsurface fluid movement in this area.

Very truly yours,



George L. Carlson

George L. Carlson
Division Production Manager

NORTH HOBBS UNIT PROPOSED
AUGUST 29, 1973

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Midland, Texas, on August 29, 1973. The attendance list is attached.

The meeting was called to order at 8:15 a.m. by Mr. Martin A. Thieme, representing Shell Oil Company. Mr. Thieme noted that the meeting would be of an organizational and planning nature. It was the unanimous opinion of those present that secondary oil potential exists in the proposed North Hobbs Unit and that the subcommittee would proceed to fulfill the charges given by the Working Interest Owners in their July 31, 1973, meeting.

Mr. Thieme noted that AMOCO has sent the subcommittee most of the data pertaining to the North Area. The individual well logs will be forthcoming.

Mr. S. B. Pontious, discussed differences in log Øh between his findings and those presented in the March 1972 field-wide study. With no objections, the subcommittee directed Shell as expediter to review all the geological x-sections received from AMOCO and report the results at the next meeting. Shell was further directed to re-evaluate the existing logs with special emphasis on recent logs and report their findings.

The subcommittee will meet in approximately six weeks to determine if more log data are required and, if necessary, recommend a key logging program to the Working Interest Owners.

Mr. W. R. Greene discussed the results of several workovers involving Zone I of the San Andres. He demonstrated that higher water cuts were found in Zone I than depicted in the field-wide study and that the Shell State B-1 (Section 33) tested 100% water.

All companies were requested to send the following information to the chairman of the Engineering Subcommittee at their earliest convenience:

1. Logs run since January 1, 1971, and not previously sent to AMOCO

2. Information on current perforated intervals not previously sent to AMOCO

There being no further business, the meeting was adjourned at 11:30 a.m.

MINUTES OF ENGINEERING SUBCOMMITTEE MEETING
NORTH HOBBS UNIT PROPOSED
NOVEMBER 26, 1973

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Midland, Texas on November 26, 1973. The attendance list is attached.

The meeting was called to order at 10:00 A.M. by Mr. Martin A. Thieme, representing Shell Oil Company. Mr. Thieme noted that the purpose of the meeting was to discuss the method and results of the petrophysical study and the geological study as completed to date, to determine if more log data were required and, if necessary, recommend a key logging program to the Working Interest Owners.

Mr. S. B. Pontious presented a summary of the petrophysical study as detailed in the attachment to the November 15, 1973 letter to the engineering subcommittee. Mr. Pontious discussed the plats of each zone which showed both the geographical areas where better quality logs gave good petrophysical control and the hashered areas where the existing poorer quality logs might require additional log data. It was moved by Shell and seconded by Skelly that the subcommittee accept the petrophysical study and preliminary results as presented. The motion was passed with the voting recorded as follows:

Vote	Companies
Yes	Chevron, Cities Service, Continental, Getty, Samedan, Shell, Skelly, Sun and Texaco
Pass	Amerada, Exxon and TPOC

Mr. F. E. Coupal presented a summary of the geological study as completed to date. East-West cross-sections have been constructed through every well to show the structural and stratigraphic distribution of the major porous beds. Mr. Coupal reported that it is evident from detailed correlation that each zone in the San Andres has one or more relatively high porosity beds that may behave as "thief" zones to water injection. Zone III seems to have the lowest range in permeability and also has a more effective upper seal (sandy break) from the more permeable upper zones. It may be difficult to isolate Zone II from the highly permeable interval at the base of Zone I. In addition, Zone I appears to have other individual porous beds that overlie and are poorly connected with the water drive interval. It appears in Section 31, at least, that the low water-cut production from Zone I in some of these wells may be from one of these "isolated" beds. Mr. Coupal further reported that nine Grayburg sand units can be correlated over most of the field with not more than three or four of the sands appearing to have sufficiently continuous permeability to be floodable. However, adequate data is lacking to quantitatively determine lateral continuity, or even satisfactory net pay values. A review of the Grayburg core analyses from seventeen wells in the North area indicated with reasonable certainty that for a minimum permeability of 0.2 md., a cut-off porosity of not less

than 11 percent should be used for the sands. This would require a reduction of approximately one half of the Grayburg "net pay" values as reported by the previous engineering subcommittee for the field wide study.

After much discussion, the subcommittee determined that there were three alternatives for establishing øh in the hashered areas of poor petrophysical control.

Alternative No. 1: Recommend a key logging program to the Working Interest Owners which would involve approximately twelve to fifteen wells.

Alternative No. 2: By utilizing the existing logs establish "net h" values in the areas of poor petrophysical control and extrapolate average porosity from offsetting areas of good petrophysical control to determine øh in areas of poor control.

Alternative No. 3: Determine the ratios of the øh values in the areas of good control to the øh values reported by the previous engineering subcommittee for the field wide study in the same areas. Apply these ratios to the øh values in the areas of poor control reported by the previous engineering subcommittee.

It was moved by Shell and seconded by Samedan that the subcommittee attempt to determine the øh values in the hashered areas of poor log control by a method other than a key logging program at this time. The motion passed with all companies present voting YES.

The subcommittee instructed Shell to determine the øh values under Alternatives Nos. 2 and 3 and report the results at the next subcommittee meeting to be held in February. There being no further business, the meeting was adjourned at 2:00 P.M.

MINUTES OF ENGINEERING SUBCOMMITTEE MEETING
NORTH HOBBS UNIT PROPOSED
APRIL 10-11, 197-

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Midland, Texas on April 10-11, 1974. The attendance list is attached.

The meeting was called to order at 9:30 a.m. by Mr. Martin A. Thieme, representing Shell Oil Company. Mr. Thieme noted that the purpose of the meeting was to discuss in detail the results of the geological and petrophysical re-evaluations, to construct Øh maps by zone, to construct water-cut maps by zone, and to construct a zonal completion status map.

Mr. F. E. Coupal discussed the completed geological study in detail; a summary of which was mailed to each member of the subcommittee on March 7, 1974.

The meeting was then turned over to Mr. S. B. Pontious for a discussion of the log analyses. A poll was taken which showed that only 5 of the 13 companies present were prepared to discuss and validate the log analyses on their leases. The chairman reminded the subcommittee that they were requested to be prepared to discuss in detail those items enclosed in the letter dated March 7, 1974 calling this meeting. The chairman then asked the subcommittee what more he or Shell could do to assist them in being prepared for future subcommittee meetings. The consensus of opinion was that Shell could not have done more to assist the members and that the problem was with individual company manpower allocations, etc. It was noted that the 5 companies that had reviewed the log analysis were in agreement with the resulting Øh calculations on their wells. Each company present was given a copy of the log analysis detail on their wells. The subcommittee decided unanimously that each company would check and validate their Øh values by zone by Friday, April 19, 1974, using the method approved by the subcommittee.

A discussion arose concerning the method of contouring the Øh maps. Three companies favored computerized contouring (Getty, TPOC and Skelly) while the other companies favored hand contouring. Skelly volunteered their services for computer contouring. The subcommittee then directed Skelly and/or Shell to contour the Øh maps by computer with payment of any expenses having to be authorized by the Working Interest Owners and that Shell should proceed to refine the existing preliminary Øh maps by hand using the work done by the subcommittee in the meeting. The results will be presented and finalized by the subcommittee at the next meeting which could then be changed only by new log data. Several companies indicated that new logs were forthcoming.

The well-zone completion status map as of January, 1974 was constructed using the available data. Water cuts calculated from the October, November, and December 1973 State Reports were used to initiate the construction of zonal water cut maps. Several anomalous areas developed in water cut trend. The subcommittee decided that each company should be requested to provide two

representative well tests (oil, water, and gas) on each of their wells. The first test being the most recent test just prior to January 1, 1974 and the second test being the most recent test after January 1, 1974. Shell was directed by the subcommittee to refine the water-cut maps by zone using the new well test data and present the results at the next meeting where the subcommittee will finalize the maps. Shell was further directed to construct preliminary GOR maps by zone to be finalized by the subcommittee at the next meeting.

There being no further business the meeting was adjourned at 3:30 p.m.

MINUTES OF ENGINEERING SUBCOMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
SEPTEMBER 11-12, 1974

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Houston, Texas on September 11-12, 1974. The attendance list is attached.

The meeting was called to order at 9:30 a.m. by Mr. Martin A. Thieme, representing Shell Oil Company. Mr. Thieme noted that the purpose of the meeting was to construct and finalize the Øh maps by zone, the water-cut maps by zone, the GOR maps by zone and to discuss various methods of determining remaining oil production by 40-acre tracts in Zone I San Andres.

While discussing the construction of the Øh maps, several companies stated that they would be logging wells in the near future and that these logs would be available for inclusion in the Øh map construction. The following tabulation shows the location of the wells these companies will log and the approximate time that the logs will be available to the subcommittee.

Company	Well Location	Timing
Continental	State A-29 #1 (J)	1 week
Skelly	Section 17 (M)	2 weeks
Amerada	Section 30	4 weeks
Amerada	Section 18	4 weeks
Getty	Section 19	by year end
Getty	Section 29	by year end
TPOC	Section 24 (P) State G-1	3 weeks
Cities Service	Section 31 (B) Fowler #2	by year end

After discussing the relative merits of hand contoured Øh maps and computer contoured Øh maps, the subcommittee decided to combine the hand and computer contoured maps for the finalized Øh maps for each zone. It was moved by AMOCO, seconded by Continental and unanimously approved by all companies present that the engineering subcommittee recommend to the Working Interest Owners that a cut-off date of January 1, 1975 be established for all well logging data and well test information that is to be considered by the engineering subcommittee in completing the charges given by the Working Interest Owners and that the subcommittee proceed with its work using the best available data. It was resolved that the engineering subcommittee would proceed with its work observing the January 1, 1975 cut-off date unless directed otherwise by the Working Interest Owners.

It was further moved by AMOCO, seconded by Continental and approved that the subcommittee would in constructing the finalized Øh maps use the hand contoured Øh maps as a base and make appropriate revisions as judged necessary from the computer contoured Øh maps. The voting is recorded as follows:

YES Skelly, AMOCO, Amerada, Continental, Exxon, Cities Service, Samedan, TPOC, and Shell
NO Chevron and Getty

It was moved by Skelly and seconded by Cities Service to delete the 0.7 Øh data point in Section 31 (B) on the San Andres Zone II Øh map. The motion failed with the voting recorded as follows:

YES	Skelly, Amerada, Continental, Getty, and Cities Service
NO	Chevron, Exxon, Samedan, TPOC, and Shell
PASS	AMOCO

It was moved by Shell and seconded by Chevron to retain the 0.7 Øh data point in Section 31 (B) on the San Andres Zone II Øh map and that the subcommittee effectively tighten the contour interval on this 40 acre tract and minimize its affect on the surrounding acreage. The motion passed with the voting recorded as follows:

YES	Chevron, Skelly, Continental, Getty, Exxon, Samedan, TPOC, and Shell
NO	Amerada
PASS	AMOCO and Cities Service

(It was noted that Cities Service intends to re-log this well by year end.)

The subcommittee constructed the San Andres Øh maps by zone and approved each map as finalized subject to change only by new log data secured by the subcommittee by the cut-off date of January 1, 1975. The subcommittee approval of the finalized San Andres Øh maps by zone is recorded as follows:

	San Andres Øh Map			
Company	Zone I	Zone II	Zone IIIU	Zone IIIL
Chevron	Yes	Yes	Yes	Yes
Skelly	Yes	Yes	Yes	Yes
AMOCO	Pass	Yes	Yes	Yes
Amerada	Yes	Yes	Yes	Yes
Continental	Yes	Yes	Yes	Yes
Getty	Yes	Yes	Yes	Yes
Exxon	Yes	Yes	Yes	Yes
Cities Service	Yes	Pass	Yes	Yes
Samedan	Yes	Yes	Yes	Yes
TPOC	Yes	Pass	Yes	Yes
Shell	Yes	Yes	Yes	Yes

As directed by the subcommittee in its April 10-11, 1974 meeting, Shell had refined the San Andres water cut maps by zone and presented these maps for finalization by the subcommittee along with a discussion of how they were constructed. Shell noted that the preliminary San Andres GOR maps by zone had also been constructed as directed by the subcommittee in its April, 1974 meeting. Due to the hour, the subcommittee decided to defer finalization of the water-cut and GOR maps until its next meeting to be held the first week in November, 1974.

Further subcommittee work was then discussed in detail. The general consensus of opinion was that current company work loads did not permit individual subcommittee members sufficient time to do significant subcommittee work outside of subcommittee meetings and that the work would best be done in future meetings. In view of these comments, it was moved by AMOCO and seconded by Cities Service that further subcommittee work on the water-cut and GOR maps be done in

subcommittee meetings and that no additional data tabulations or maps be mailed out to subcommittee members. The motion passed with the voting recorded as follows:

YES	Chevron, Skelly, AMOCO, Amerada, Getty, Cities Service, TPOC and Shell
NO	Continental, Exxon and Samedan

Shell led a brief discussion concerning techniques for determining remaining oil production by 40-acre tracts in San Andres Zone I. Various suggestions were made by subcommittee members with no decisions being made. Due to the late hour, further discussion on Zone I was defered to the next meeting.

There being no further business the meeting was adjourned at 4:00 p.m.

The Engineering Subcommittee
North Hobbs Unit
(Addressee List Attached)

Gentlemen:

Attached are the minutes of the North Hobbs Engineering Subcommittee meeting held in Houston, Texas on September 11-12, 1974. Although we did not accomplish all of the items that were set forth on our agenda, we did have a productive and successful meeting. The next subcommittee meeting will be scheduled during the first week of November, 1974.

As a result of reassignments Mr. H. J. Swartz has become the chairman of the Engineering Subcommittee. Please change your mailing lists accordingly.

Yours very truly,

H. J. Swartz

for M. A. Thieme
Chairman Engineering Subcommittee
Proposed North Hobbs Unit

Minutes of Engineering Subcommittee Meeting
Proposed North Hobbs Unit
November 6-7, 1974

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Houston, Texas on November 6-7, 1974. The attendance list is attached.

The meeting was called to order at 8:45 a.m. by Mr. H. J. Swarts, representing Shell Oil Company. It was noted that the main purpose of the meeting was to construct water cut and GOR maps for each San Andres zone. Production and completion statistics have been updated and recorded by Shell as follows: 1) Individual well data sheets (zonal completion history and Øh, BHP surveys, monthly production history, well tests and overall assessment of current well status), 2) Updated cross sections, 3) Well status map (current completion zone and whether or not suspicion of behind pipe communication) and 4) State-witnessed "GOR" test sheets (water and gas data posted on appropriate zonal map). While preparing and collecting this data the special problem of frequent behind pipe communication became evident. Most of these wells were initially completed, during the 1930's, as open hole Grayburg - San Andres Zone I producers. Approximately fifteen years later the wells were frequently deepened to Zone III, a liner set and perforated completions made in the lower zones. In many cases the perforated completion interval has been changed several times and been subjected to several stimulation attempts with acid treatments.

Mr. R. W. Phillips presented some examples of Shell's experience with behind pipe communication problems on the McKinley A, McKinley B, Rice and State A leases. Based on the results of production tests, temperature surveys and radioactive tracer logs, Mr. Phillips believes that the water production problems experienced in these wells resulted because of the inability to isolate the production from high permeability in the Zone I San Andres reservoir. Instances of both successful and unsuccessful attempts to eliminate high water producing rates from Zone I were reported. It was concluded that behind pipe communication with Zone I is quite common throughout the field and is generally characterized by high water producing rates.

Those present decided to use the production data from the State-witnessed Annual "GOR" tests, taken during the third quarter of 1974, as the main control points. The completion status and production data posted on the zonal maps were verified and the necessary changes made. If a completion interval included a portion of a dense zone, only the productive zone was posted on the maps. The subcommittee then attempted to construct water cut contour lines for each of the four San Andres zones. The Zone I production performance appears to be indicative of edge water encroachment and a reasonable water cut map was constructed. However, the water cuts from the other zonal completions were erratic and difficult to fit to an edge water concept. It was pointed out that the subsea depth of 614 feet, that is often erroneously

referred to as an original oil-water contact, is actually the depth at which the first water production was obtained in the discovery well. This depth is an arbitrary one which has been used to define productive limits but is not intended to infer an original or current water level. Overlays of the water cut maps that had been prepared for Zones II, III_U and III_L were superimposed on the Zone I water cut map to demonstrate that the control points matched and therefore appeared to be indicative of communication problems. The consensus was that the water source was most likely the lower portion of Zone I. However, there still was disagreement over what degree of water invasion, if any, has occurred in the other zones.

A motion was made by Amerada and seconded by Skelly that all of the current water production be considered to be coming from Zone I and that a water cut map should be prepared for only this reservoir with the lower zones assumed to have no quantifiable water influx. The voting is recorded as follows:

YES: Amerada, Arco, Cities Service, Getty, Samedan, Skelly, TPOC, and Shell

NO: Continental and Exxon

A motion was made by Amerada and seconded by Continental to approve the water cut map for Zone I, as drawn, with the condition that revisions would be made as necessary to correct for new data resulting from future remedial efforts completed prior to the cutoff date of January 1, 1975. The motion was approved unanimously. A copy of this approved water cut map is attached. It is requested that each representative carefully review the completion status depicted on this map and advise Mr. H. J. Swartz, Shell (713-220-1022), of any errors.

The Committee members were advised that Shell, on the behalf of all operators, has requested the Field Permanent Bottom Hole Pressure Committee to confine the selection of key wells to twenty-four flowing producers that are completed in only one zone. Hopefully two or three surveys in each zone can be obtained. It was also requested that the shut in time be increased from 24 to 48 hours. It is believed that these changes will greatly improve the quality of the data that will be obtained during the next annual survey in April, 1975.

Construction of GOR maps for San Andres Zones II, III_U and III_L were commenced but not completed due to lack of time. These maps should be finalized at the next engineering committee meeting which will be held in Midland on December 5, 1974.

Mr. Paul Czarkowski, Shell, presented a review of the method used by the previous engineering committee to determine primary and secondary reserves by zones. These calculations are based on the water cut, GOR and pore volume maps in conjunction with a material balance prediction of solution gas drive efficiency and a prediction of waterflood recoveries. Secondary reserves were based on a Stiles approach applied to an 80-acre five-spot

flood pattern. A decision on what changes and adjustments should be made on these techniques will be decided on at the December meeting. Also at this meeting it will be necessary to decide on a method for predicting the remaining primary reserves by tract for Zone 1. ~~Mr. H. J. Swartz, Shell, presented an example calculation which incorporated three arithmetically-weighted factors: distance from the 100 per cent water cut line, water cut and oil production rate.~~ The engineering representatives were asked to consider what weighting should be assigned to a Zone I well that is also completed in other zones. ~~It was requested that everyone prepare a recommended procedure for the apportionment of remaining Zone I reserves and submit it to Shell prior to December 5th if unable to attend the meeting.~~

Messrs. F. E. Coupal and S. B. Pontious reviewed the results of a study of the basal Grayburg net pay development. (Most of this data was sent to each member of the Engineering Subcommittee on March 7, 1974). The new data presented by Messrs. Coupal and Pontious are: 1) A tabulation of the total net pay determinations by well and 2) a total net pay isopach of this basal Grayburg sand reservoir. A copy of each of these items is attached. The separation between gas cap and oil column thicknesses will be done at a later date. It was their considered opinion that it will not be possible to sufficiently quantify the porosity variations to justify the construction of porosity - feet maps. Therefore ~~the recommendation~~ is to apply an average porosity to ~~the net pay maps~~.

The meeting was adjourned at 3:30 p.m. on Thursday, November 7, 1974.

Minutes of Engineering Subcommittee Meeting
Proposed North Hobbs Unit
December 5, 197-

The meeting was called to order at 8:45 a. m. by Mr. H. J. Swartz. It was noted that the main purpose of the session was to construct and approve GOR maps for each San Andres zone. There was a discussion of the method of approach (using the State-witnessed GOR tests taken during the third quarter of this year as the main control points) and of the use of these maps for reserve determinations. It was unanimously agreed that a GOR map was not needed for Zone I inasmuch as it is anticipated that the remaining reserves from that reservoir can be recovered by continued water influx. A uniform current gas saturation will be assumed. All known corrections to well completion status were made. Unanimous approval was obtained for the GOR maps that were constructed for San Andres Zones II, III_U and III_L. These maps will be updated and finalized at the next Engineering Committee meeting.

A discussion followed on the technique to be used for calculating remaining primary and secondary San Andres reserves by tracts. It was agreed that a similar method to that used by the previous engineering committee would be preferable and that Shell should prepare the required predictive performance curves (based on material balance and waterflood recovery calculations). The results of these studies will be presented at a future meeting in order to obtain final committee approval before calculating tract reserves.

The need for obtaining BHP buildup surveys on selected wells were discussed. These wells are those which are flowing and which are effectively completed in only one zone. Very few wells meet these prerequisite and it was recommended that surveys be taken as near to year-end as possible in the following wells: Amerada Hess McKinley 3, III_U in Section 30(C); Continental State A-33 No. 1, III_L in Section 33 (M); Exxon Bowers A Federal No. 10, III_U in Section 29 (L); Getty McKinley No. 2, II in Section 30 (H); Gulf Grimes B-1, III_U in Section 33 (I); and Gulf Grimes A-5, III_U in Section 32 (M). It was also agreed that the Engineering Subcommittee would recommend to the Working Interest Owners that an adjustment be made to any production parameter that incurred a production loss because of these BHP surveys. In addition it is requested that each operator furnish Shell with a copy of all BHP build up data with sufficient information to make a Horner-type interpretation.

The subject of ~~a procedure for apportioning by 40-acre tracts the Zone I reserves were then discussed in detail.~~ Potential factors considered were: ~~distance from the 100 percent water cut line, oil production rate, water cut, current recoverable oil in place and areal sweep efficiencies.~~ In addition, Mr. Leon Veeder, Samedan Oil Corporation, presented hypothetical calculations that predicted recoveries based on assigning different areal sweep efficiencies (between 65 and 95 percent), depending on the water cut. ~~It was unanimously agreed that a "correct" solution to this complex problem of~~ future oil migration ~~must consider the effects of different oil rates,~~ porosity feet,

well spacing and strength of the aquifer. Simplifying assumptions could include the simultaneous opening of the entire Zone I productive interval in each well bore and uniform permeability, swept zone residual oil and current formation volume factor. It appeared to those present that this "correct" solution would best be done by the use of a reservoir simulation model. Shell volunteered to investigate this possibility and prepare an estimated cost for this type of study.

The question of completion intervals in Zone I affecting the production performance was discussed. Some of the representatives felt that additional work should be done to determine if various correlatable members in Zone I appeared to contain the bulk of the water. Shell volunteered to make a cursory review of the data and present the findings at the next engineering committee meeting. At that time the Engineering Committee will determine the feasibility of further study to better define the Zone I water influx.

The meeting was adjourned at 4:30 p. m.

MINUTES OF THE ENGINEERING SUBCOMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
JANUARY 22-23, 1975

The meeting was called to order at 8:45 a.m. by Mr. H. J. Swartz. Eleven companies, which operate 70 percent of the current producers, were represented (attendance list attached). The main purpose of this meeting was to finalize the porosity-feet, water cut and GOR maps for each of the four San Andres zones and to develop an approach for apportioning the San Andres Zone I reserves.

The first order of business was the finalization of the porosity-feet maps. Since the construction of the maps at the engineering subcommittee meeting of September 11-12, 1974, Shell has received 13 usable new logs. In addition, top of zone correlation changes in three wells required adjustments to the individual zonal values and a core analysis was obtained on Sweet McKinley B 1-A-G, Section 20 (I). Also, it is necessary to differentiate the Zone I porosity-feet between original gas and oil columns. All of the San Andres zonal porosity-feet maps were finalized and approved unanimously. Attached are copies of these maps and a tabulation summarizing all of the petrophysical interpretatons by wells. The original oil and gas in place in the San Andres for each lease will be determined by using the grid technique (ten-acre blocks) at the next engineering subcommittee meeting.

Grayburg net oil, net gas pay and total net pay isopach maps have been prepared by Shell. Copies of these are attached and we request that each representative review these in detail and be prepared to finalize these at the next meeting. Individual well porosity determinations cannot be made because of the lack of petrophysical data.

At the December 5 subcommittee meeting, Shell had volunteered to make a cursory review of the occurrence of net pay development with respect to completion intervals in order to determine if further study was warranted to better define San Andres Zone I water influx. The results of such a geological review were presented by Mr. F. E. Coupal. He has constructed a map with a schematic representation for each well of the vertical location of the net pay, streaks of higher than average porosity development (and presumably higher permeability), dense streaks separating pay zones, and the thickness of the argillaceous zone which separates Zone I and Zone II net pay. The location of the completion intervals was then superimposed on the pay development and attempts were made to explain anomalous water cut performance between offsetting wells. ~~It was concluded that this reservoir could not be subdivided into correlatable and extensive subzones.~~ Also presented was an isopachous map of the thickness of the argillaceous zone separating Zone I and Zone II net pay. It was the consensus of the subcommittee that there is more areal separation existing between the zones than previously believed to be present.

The subcommittee then directed their attention to the finalization of the water cut maps. These maps will be used to determine the volumes of each reservoir that have been swept by natural water influx in order to ascertain tract and total reserves. The current completion status has been reviewed and many changes made. Each company representative should carefully examine the zones shown to be open to production for his wells and advise me (713-220-1022) of any disagreements. Some of these changes in completion status helped explain two anomalous areas on the Zone I water cut map drawn by the subcommittee on November 7. Firstly, the zero contour

ne in Sections 25 and 30 could be eliminated because two of the clean wells, exaco State C 1 and 2, were determined to be completed in the Grayburg only and therefore did not constitute control points. In addition, although Amerada Hess McKinley 4 is currently a clean producer from upper Zone I, production prior to ebruary 1973, was at a high water cut when all of Zone I was produced. This portion of the map was adjusted accordingly. Similarily, Mobil Berry 2, is also a Grayburg only producer and not a control point. Significant changes were also made round the Chevron lease located in Section 29. A southern offset to the Chevron ease, Amerada State A-1, was worked over in December 1974 to open the entire Zone I section to production with three other zones and is now producing at 76 percent ater cut. Based on this additional point and a study of Mr. Coupal's geologic eview, the contours in this area were adjusted accordingly. A copy of the finalized map is attached and was approved by everyone present except for a negative ote by the Amoco representative.

The question of whether or not water cut maps should be constructed for the other San Andres zones was re-examined. At the November subcommittee meeting water ut maps were drawn for each zone but because the control was sparse and questionable (behind pipe communication with Zone I?), it was decided to assume that all water production was from Zone I and that the other zones would be considered to be at the nitial water saturation. The voting on this motion was eight in favor and two (Continental and Exxon) opposed. This is the only significant disagreement in the subcommittee to date and consequently considerable time was devoted at this meeting to iscussing the "best" method of determining whether any significant water influx has curred in these other San Andres zones. It was concluded that whereas water has ntered these reservoirs either by direct communication naturally (between I and II here no argillaceous separation exists) or because of mechanical failure (behind pipe ommunication), it is not possible to quantify the degree of influx on a lease basis. A statement was formulated at this meeting as follows: "It is apparent from the study of San Andres zonal production performance that Zone I is the major source of water production and encroachment and that only Zone I water saturation can be reasonably estimated on the areal basis; by the construction of water cut maps. Consequently, current water saturations for Zones II, III and IIIb will be estimated on a reservoir basis." This approach was approved by everyone present except for Amoco. These values for current water saturations will be approved at the next engineering subcommittee meeting.

The next order of business was the apportionment of Zone I primary reserves by tracts, assuming continued water influx. To date two methods for approximating these reserves have been presented but neither has been accepted. At the last meeting Shell volunteered to investigate the feasibility of using a reservoir simulation model to resolve the problem. Mr H. J. Swartz reported the results of consultation with Shell's computer experts. In summary, it appears that a "proven" Shell program could be used and a study completed within a reasonable period of time. However, because of the anomalous behavior of some wells (clean wells offset by high water cut producers), it is strongly recommended that a history match be attempted in order to match the general influx pattern and approximate the aquifer strength. It is recommended that this history match be attempted on a very coarse grid (10 by 15) and include the entire field. An arbitrary and quick allocation of production between ne I and other reservoirs would be necessary. It was therefore recommended by Shell hat the coarse grid approach be tried immediately and the results reported to the subcommittee in order to better ascertain the feasibility and costs of such an endeavor. The prediction mode would require a much more detailed grid and would require a ballot for approval by each working interest owner to share in the associated expenses. Each company representative present expressed the belief that the reservoir

simulation approach appeared to offer the only acceptable method of apportionment that is recognized at this time but that they would like to have the insight to future costs and complexity of resolution that can be obtained by a quick coarse grid run to be performed by Shell. Following a review of the preliminary results, a specific recommendation will be made to the Working Interest Owners Committee.

During the discussions on the feasibility of reservoir simulation, the question was raised concerning the variations in reservoir pressure between zones and areally within zones. Unfortunately, none of the requested historical BHP buildup data had been received before the meeting but based on the key well BHP statics and the analyses of four special buildup surveys, it can be tentatively concluded that the BHP in the proposed northern unit area is highest in Zone I, about 100 psi lower in Zone II, and another 150 psi lower in Zone III. It is again requested that each operator submit all BHP buildup data on all Grayburg-San Andres completions. The additional data should enable the construction of zonal pressure history with time and areal kh variances in conjunction with core analyses. The year 1974 BHP data received to date is summarized on an attachment.

Mr. P. J. Szatkowski then presented a detailed review of the planned method for calculating reserves. Key assumptions will include: current GOR, initial and current water saturations, relative permeability relationships, current pressure and abandonment pressure. Water cut (I) and GOR (II, IIIU, and IIIL) values will be determined by 40-acre tracts by "gridding" these maps at the next engineering sub-committee meeting. It was agreed at the December meeting to accept the relative ermeability curves, initial water saturation and the abandonment pressure (100 psi) used in the Amoco report.

The GOR maps that were constructed at the December meeting were then finalized with unanimous approval. The only new data resulted from two Arco wells, Grimes 1 and 2, which are located in Section 28 and were both recently perforated in Zone II so that they are now producing from II and IIIU. This work resulted in overall lower GOR's which were consistent with the previously depicted GOR's for these zones. Copies of the finalized maps are attached. A reservoir-wide average GOR will be assigned to Zone I at a later date.

The meeting was adjourned at 3:00 p.m., Thursday, January 23, 1975.

MINUTES OF THE TECHNICAL COMMITTEE MEETING
PROPOSED NORTH ROBBS UNIT
MARCH 5&6, 1975

The meeting was called to order at 9:15 a.m. by Mr. L. J. Swartz. Fifteen companies, which operate 87 percent of the current producers were represented during at least a portion of the two-day session. (Attendance list attached.) The main purposes of this meeting were to formulate a recommendation for determining Zone I reserves and to establish a procedure for determining San Andres zonal tract values for original oil and gas in place, average producing GOR (II, IIIU & IIIL) and average water cut (I..

At the January meetings it had been decided that Shell should make preliminary computer runs with their three-dimensional, three-phase, compressible fluid program in order to better evaluate the feasibility and costs for making an anlysis of future Zone I production by the use of reservoir simulation. The results of the preliminary efforts were discussed with the committee and are summarized as follows. The reservoir model used for these preliminary runs consisted of three non-communicating San Andres layers (I, II and III) covering the entire field with the structural location and porosity-feet values as determined by the Technical Committee. Fluid properties and relative permeability relationships were the same as those in the previous Technical Committee report. A five by ten grid was superimposed on the structure in a manner which resulted in all of the producers being located in 27 grid blocks. The wells in each grid block were summarized by completion interval and represented by one composite well, in the center of the block, containing the total zonal millidarcy-feet open to production in that grid block. An infinite and radial aquifer was placed in communication with only Zone I and input at three westerly-located points. The cumulative field production was represented as being produced at a constant rate over life. Several initial or Phase 1 runs have been made, based on the aforementioned conditions. Adjustments to the data are now being made, but in the opinion of the Shell computer experts the proposed application is feasible and Shell is willing to make the complete analysis for one set of predictive premises for a flat rate charge of $6000. This amount was determined by estimating the actual computer time needed to complete all phases of the study ($5000) and includes a $1000 estimate for contract clerical help, needed to prepare data and assemble annual production statistics for about 350 wells over a 40-year period. No charges will be made for professional or non-professional overhead nor would a charge be made for a program licensing fee. Continuation of this study, for the purposes of predicting Zone I reserves for a given set of conditions, would consist of inputting actual well production with time, and adjusting the permeabilities and various constraints until a satisfactory history match is obtained. Following this a similar history match would be obtained using a finer grid system. An analysis would then be made of future production performance for a given set of conditions. Shell would then present the Technical Committee with a report of the assumptions made and results with an interpretation of their meaning. Shell made a motion, which was seconded by Samedan, that the Technical Committee recommend to the Working Interest Owners that a computer analysis of Zone I reserves be made, for a given set of predictive conditions, on the Shell reservoir simulation program for a flat rate of $6000. The voting on this proposal was:

FOR: Amerada, Amoco, Arco, Cities Service, Continental, Getty Exxon, Samedan, Skelly, Texaco, Texas Pacific and Shell

PASS: Gulf

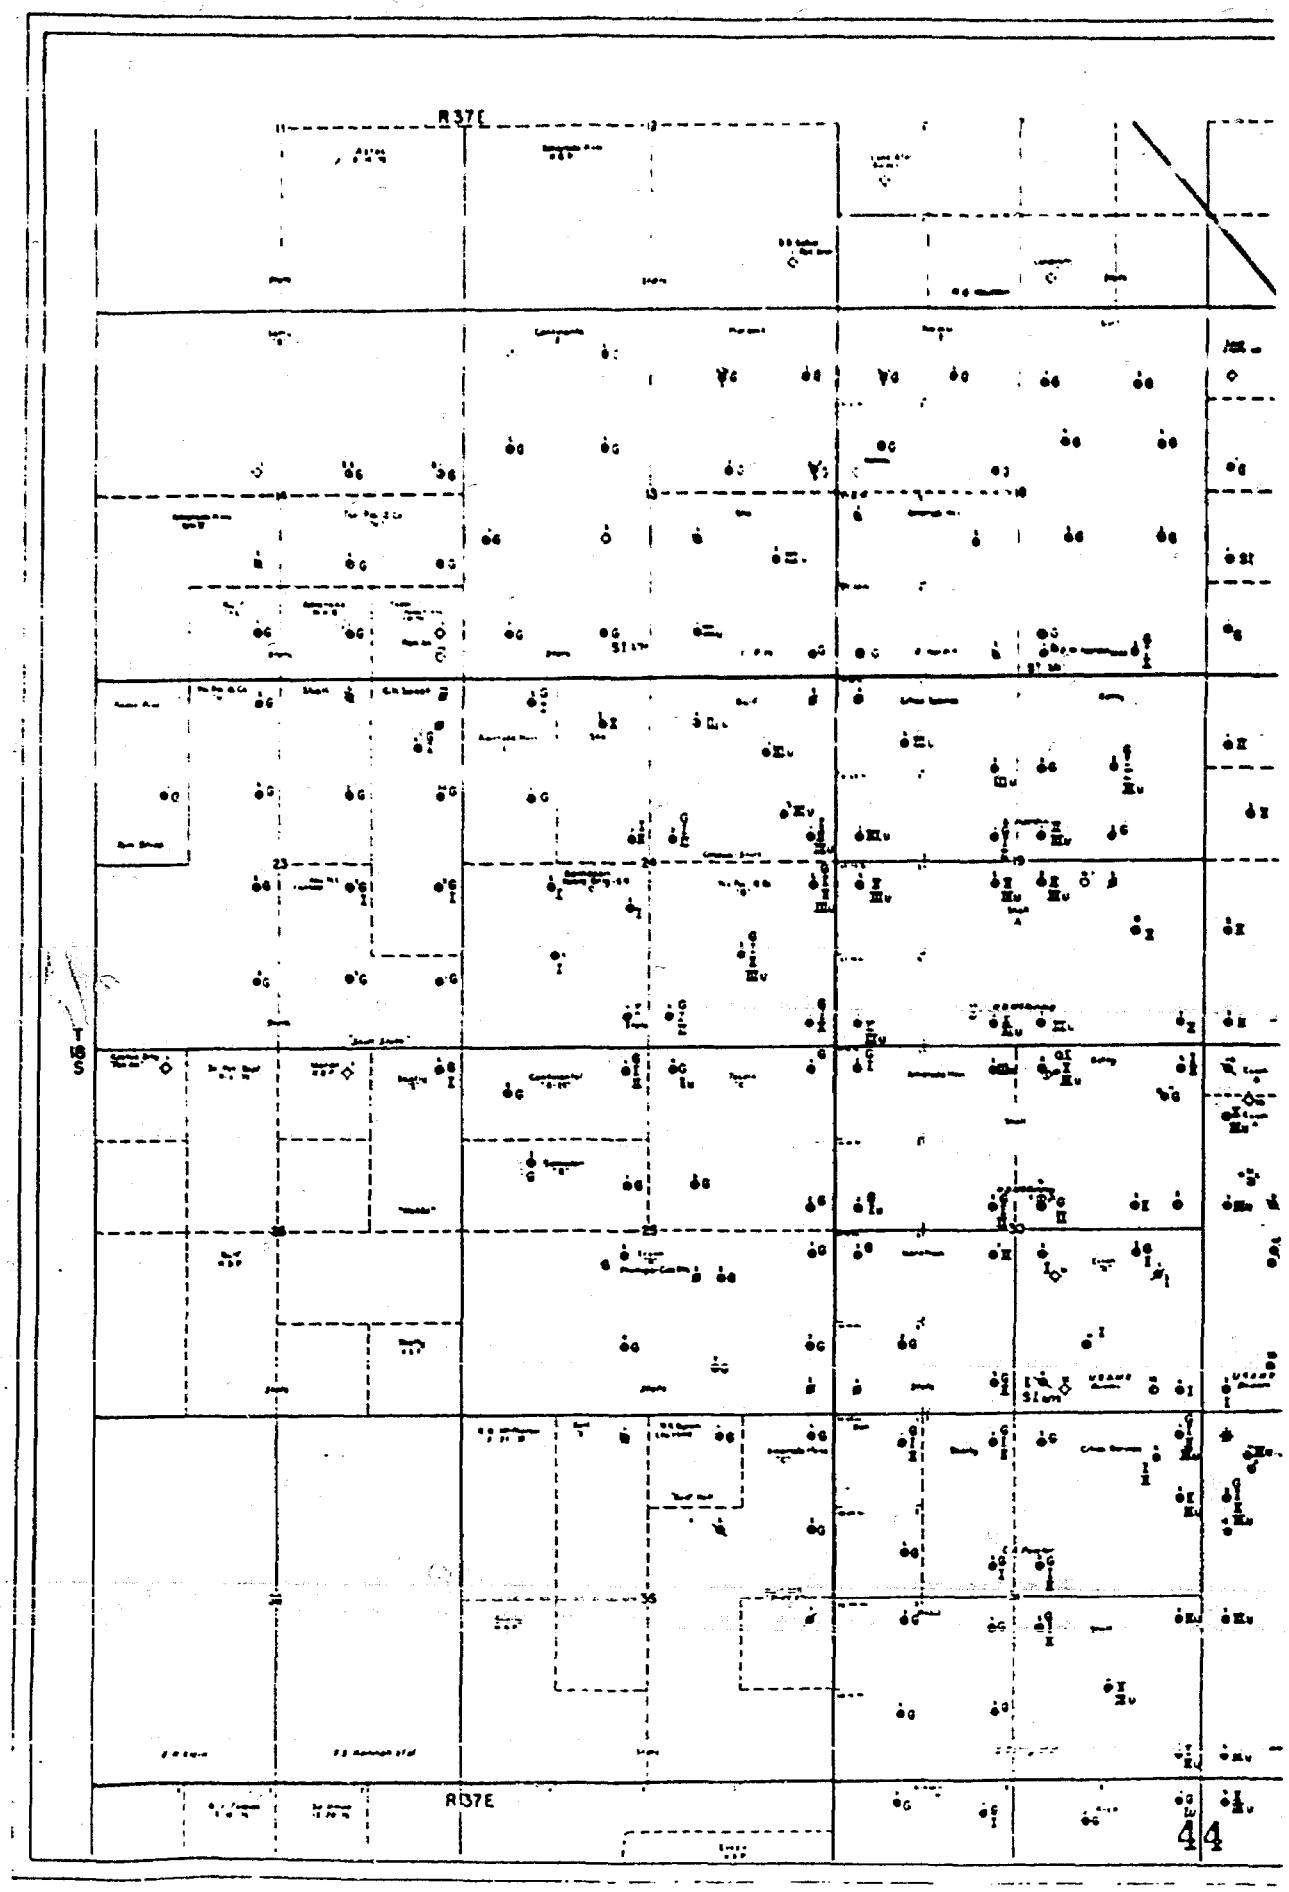
A ballot for sharing these costs will be mailed, under separate cover, to the operators. It was also recommended by the Technical Committee that the predictive mode of this study should be based on the premises that the current completion intervals are maintained status quo. This would serve as a base case and it is recognized that apportionments will then have to be made to the results in order to credit leases which have Zone I reserves but no current drainage points. Attached is a map which depicts the current completion status of each well in the proposed North Unit Areas as described in our records. It is imperative that each operator verify this description and notify me (713 220-1022) of any discrepancies.

The next order of business was a presentation of average zonal porosity and permeability values. Average porosity values have been obtained from both log and core analyses and are considered to be reliable inasmuch as they are generally accurately measured and represent excellent areal coverage of the proposed unit area. The average permeability values are more questionable because of the wide range in values and the limited data. Permeability values were averaged from three sources: cores, buildup pressure analyses and those used by the previous Technical Committee. The core-derived values exhibited large differences and the data were averaged both arithmetically and geometrically for all available core analyses from wells within one mile of the proposed unit area. Arbitrarily the average of these two summations (arithmetic and geometric) was used as representative of the cored values. Stratification analyses, using the Dykstra-Parsons variance approach have been made and will be used as a guide for the reservoir simulation study. Shell has measured 83 BHP buildup surveys in 24 different wells. Only 29 of these, taken in 10 wells, are representative of single zone performance. In addition three of the four buildup surveys that were requested by the Technical Committee, at year-end, were usable for permeability determinations. Since no other company has ever taken buildup surveys in the proposed unit area, the resulting averages from this source are representative of only limited portions of the reservoirs. The previous Technical Committee used zonal permeability values which were derived from cores and adjusted to fit performance. A comparison was also made, by Shell, of the initial potential tests of all wells completed by 1931. This data was recorded on a map and iso-potential lines drawn. These date can only be used in a qualatative manner but strongly indicate that the lowest productivities are in the south unit area whereas a fairway which generally follows the structural highs is located in the northern unit area and average to good productivities occur in the remainder of the wells. The resulting average permeabilities, which are summarized in the attachment, are therefore considered to be tentative. Additional insight into actual values should result from the reservoir simulation study and will be incorporated with these aforementioned values.

At the last meeting it was decided to assign reservoir average current water saturation values to the Grayburg and San Andres (II, IIIU & IIIL) and reservoir average current gas saturations to the Grayburg and Zone I.

These values were in lieu of tract determinations and would be used in calculating reserves in conjunction with relative permeability relationships. Producing data from "key wells" are being assembled but it is believed that valuable insight as to the degree of water influx into the lower San Andres will be gained from the computer analysis. In addition, similar relative permeability relationships should be used for estimating current gas and water saturations from producing gas-oil ratios and water cuts. It is therefore recommended that the determination of these average values be made at a later date.

Approval of the Grayburg net oil, net gas and total net pay isopaches maps was deferred at the request of one of the representatives in order to permit a more detailed check of the values used.



The Technical Committee then decided to determine tract values from the approved San Andres porosity-feet and Zone I water cut contour maps by using a ten-acre grid system whereas the GOR values would be based on a 40-acre grid. Values were selected for each grid block and were based on mechanical interpolation between contour lines. The determinations of tract value for original oil and gas in place, current saturations and remaining primary and secondary reserves will necessarily be made at a later date and then presented for review.

HOBBS FORMATION-SAN ANDRES FIELD
WELL STATUS

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
June 4, 1975

The meeting was called to order at 8:45 a.m. by Mr. H. J. Swartz. Thirteen companies, which operate 85 percent of the current producers were represented. (Attendance list is attached.) The main purposes of this meeting were to:

1) describe the reservoir simulation models and techniques that are currently being used by Shell for this unitization effort and

2) determine a method for constructing acceptable Grayburg net pay isopach maps.

Mr. W. C. Miller, supervisor of the reservoir simulation group at Shell Development Company, presented a detailed description of the reservoir simulation model being used by Shell to analyze the San Andres reservoir performance and in particular to determine Zone I reserves. The model can be briefly described as a three-phase, three-dimensional, compressible fluid reservoir simulation program. A relatively coarse grid of 150 blocks (ten by five areally with three zones vertically) is being used in the initial phase of this study. Each block contains about 500 acres and the anticlinal structure is included by digitized data on the top of Zone I porosity and the gross thicknesses for each San Andres Zone (I, II and III) for each block. Similarily, each block's zonal net pay was determined from porosity-feet isopach maps (constructed by the current Technical Committee for the North Unit area and by the previous Technical Committee for the South Unit wells) and the average porosity attributed to each zone. The initial gas-oil-contacts and water-oil contacts are 360 feet subsea and 614 feet subsea respectively. This mathematical representation contains an original oil-in-place for the San Andres of 835 million STB, which compares favorably to the 819 million STB calculated by the previous Technical Committee.

Input gas-oil relative permeabilities are the same as the rock curves previously used, but the oil-water relative permeabilities have been adjusted to reflect the Dykstra-Parsons stratification calculated from cores in the North Unit area. The aquifer is strategically located at three locations and communicated only with Zone I.

Oil production and zonal completion history have been input by well in five-year increments up to 1970, then the next three-year period and finally 1974 production. The latter is actually based on the rates reported in the State-witnessed annual gas-oil ratio tests taken in mid-1974. These tests have been judged, by the Technical Committee, to be the most reliable indicators of current conditions. Each well's oil rate is automatically allocated by the simulation program to the zones open to production during its entire history. The pertinent factors such as each zone's pressure, permeability, fluid saturation are accounted for in the calculations for each well. Zonal production rates are computed and a history match, for each well, is based on a comparison of cumulative oil, cumulative water, BHP history and current rates; with emphasis on current conditions.

Once a satisfactory history match is obtained, the predict mode will be run with the current completion intervals open. Each well's primary reserves will be computed by the simulator. A similar simulation, history match and comparable predict mode will then be made using a finer grid system in order to check the sensitivity of the results to this parameter. These results will then be presented to the Technical Committee at which time it will be determined what additional work is required to assign Zone I reserves by tract.

Following Mr. Miller's presentation, Shell requested an expression of opinion from those present as to whether or not there were any objections to the assumptions made or techniques being used or any suggestions. Mr. Joseph C. Solari, Chevron, suggested that the computed current tract saturations by zone, be compared to the water cut and GOR maps, prepared by the Technical Committee. It was also brought out that the computed ultimate recoveries should furnish additional insight into both primary and secondary recovery efficiencies and the crossflow volumes with time into the various San Andres layers. It may also be desirable to use this reservoir model as a basis for waterflood predictions

Concurrent with this major reservoir simulation effort Shell plans to investigate waterflood recoveries with the use of reservoir model work on both the Grayburg and the Zone III lower San Andres reservoirs. The Grayburg analysis will be based on a five-spot 40-acre symmetry element which is representative of the Grayburg reservoir considered to be floodable (northern and western flanks). The history match will be made by comparing current average well producing characteristics. It is intended to simulate the performance of the San Andres III Lower reservoir by modeling the entire reservoir, as described by the current Technical Committee work, and comparing the results of water injection under at least two different injection patterns. The benefits of infill drilling will also be examined with this model.

An error in the productive limits of the Zone I oil column porosity-feet map was shown to the Committee. The problem was caused by a miscorrelation of the top of the San Andres in that area and results in only a slight adjustment to the original oil-in-place values for the Gulf Hardin (Section 18 A, B and H) and Moranco State (Section 17E) leases. To date only twelve of the twenty-five operators have returned the forms for verification of tract original hydrocarbon-in-place values. A revised tabulation will be distributed as soon as all of the necessary corrections have been received. Three minor adjustments are also required to contours on the Zone I water cut map. These concern the 25 percent water cut line in the SE/4 of Section 34 (should curve north of Samedan Turner B-2) and the 50 and 75 percent water cut lines in the NE/4 of Section 30 (75% should be west of Getty McKinley 1 and the 50% bowed accordingly). It was also pointed out that Mobil Berry No. 4 (Section 31M) is currently completed in both the basal Grayburg and an upper Zone I (four net feet of pay) stringer. During the 1974 annual GOR State Test the well produced 30 BOPD plus 18BW but it is mapped, by the Technical Committee, to be completely

watered out in Zone I. Following a discussion and further review of the situation it was unanimously decided that the map is correct as drawn. If anyone knows of any descrepancies on any of the maps distributed to date, please advise me as soon as possible inasmuch as we intend to soon have these maps drafted for the Technical Committee report.

Mr. F. E. Coupal presented net pay continuity maps for each of the four Sun Andres reservoirs. These representations are based on determining how much of the net pay in each well zone is correlatable with the net pay development in each of the direct offsets. The net pay continuity appears to be very good and the reservoir averages are: Zone I, 94 percent; Zone II, 93 percent, Zone III_u, 90 percent; and Zone III_l 93 percent.

The current well status tabulation, furnished to each operator with our letter of May 14, 1975, should be checked carefully and returned to me as soon as possible. Particular attention should be paid to the completion interval and that the elevation shown is compatible with these measurements. Logs run in these wells have used every imaginable elevation datum and some are unique. If you have any questions about this tabulation please call either Frank Coupal (220-1333) or Hank Swartz (220-1022). Your cooperation in carefully verifying this tabulation and that of the original hydrocarbon-in-place is greatly appreciated.

Exxon Company, U.S.A. had previously expressed concern that the Grayburg net pay values selected from logged wells might include some siltstone or nonproductive rock. (See their letter dated May 2, 1975.) Mr. John M. Clayton, Exxon, summarized his work on the problem and pointed out that the production statistics on the western flanks of the proposed unit area seem to indicate that the southern wells have performed much better than the northern producers in contrast with Shell's net pay depiction which shown both areas to have similar net pay development. In summary, Exxon feels that these net pay representations should be modified. Mr. F. E. Coupal then reviewed the geologic premises used and pointed out that the nine zones at the top of the basal Grayburg are correlative across the entire field whereas the underlying wedge of net pay is more erratic in occurrence. He then distributed statistics which geographically summarized the distribution of net pay based on data from 18 cored wells. The tabulation included comparisons of cored well net pay with log-interpreted net pay and a break-out of non-permeable (less than 0.2 md) rock over 11% porosity. A tentatively revised Grayburg net pay map was presented based only on core data and a few logged wells with net pay estimates compatible with nearby cored wells. The revised map did not reflect the differences in productivity along the west flank as interpreted by Exxon. Inasmuch as no other suggestions were made, Shell volunteered to:

1) prepare Grayburg net pay isopach maps of both only the nine correlatable zones and only the underlying wedge and

2) recompile the Grayburg production statistics, in a similar fashion as that presented by Exxon, but adjusted to remove the volumes which are believed to have been produced from the San Andres reservoirs.

It was requested that Shell furnish the other operators estimates of the timing of unitization and the amounts of capital investment that will be required for secondary recovery operations. In response to this we tentatively predict the following schedule:

December 1, 1975, publish the Technical Committee report;
October 1, 1976, effective date of unitization;
and May 1, 1977, initiate water injection.

Preliminary estimates of the capital investment requirements are $12,000,000 initially and another $3,000,000 within the following two years.

MINUTES OF THE TECHNICAL COMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
OCTOBER 14 and 15, 1975

A meeting of the Technical Committee was held on October 14 and 15 in Midland, Texas. The major objectives of these sessions were to review net pay isopach maps of the Grayburg formation and to determine primary reserves of the Grayburg and upper stringer San Andres producers by the extrapolation of production performance. Fourteen companies, which operate 79 percent of the current producers were represented on Tuesday and eleven companies (76 percent of the wells) were represented on Wednesday. Attendance lists for both sessions are attached.

A brief review of previous Grayburg studies prepared by Shell for the Technical Committee was presented for reference. These include a report distributed on March 7, 1974 and an update which was presented at the Technical Committee meeting held on November 6, 1974. Net pay isopach maps, based on log and core data, were prepared by Shell and distributed to Committee members on February 10, 1975. Discussion of these maps are included in the minutes of the Technical Committee meetings held on March 6, 1975 and June 4, 1975. At the June meeting it was recommended that Shell prepare revised net pay isopach maps that would be based only on core and selected log data. It was also requested that the basal Grayburg horizon be subdivided into an upper interval (comprised of nine correlatable sands) and the lower ("wedge") interval. In addition it was recommended that Shell evaluate the amount of cumulative oil production attributable to the Grayburg, by wells, particularly along the northern and western flanks.

Mr. E. W. Kitchen who has replaced Mr. F. E. Coupal as Shell's Geological Engineering representative on the Technical Committee then presented the four revised net pay isopach maps (oil and gas pay maps for both basal Grayburg zones. These maps were based only on the data from cored well and selected logs (good quality logs which indicated similar net pay/gross interval thickness ratio to those calculated from "nearby" core control points). The enclosed type logs on Shell Rice 4 and Amoco State G5 show the stratigraphic intervals that were mapped. He then presented structure maps on the top of the Grayburg and the four San Andres subzones. Maps were also presented which reflected the cumulative oil production believed to be definitely from the Grayburg and an arbitrary allocation between zones where the Grayburg and San Andres production had been commingled. These determinations indicate that whereas the differences in production performance between areas is not as great as indicated by Exxon at the last meeting, it does appear that the wells along the southwestern flank, particularly those located in Sections 25, 31 and 36 have been the most prolific Grayburg producers.

Considerable discussion followed and revolved primarily about the problem of interpolating or contouring net pay values in areas of limited control. It was concluded that an attempt should be made to first construct percent net pay to gross thickness ratio contour lines for each map which could then be used in conjunction with the gross thickness of each well (determined from logs and/or structure maps) in order to develop the isopach of net pay maps. These percent net to gross ratio maps were constructed and reviewed and considerable discussion followed on the techniques used and whether or not these ratio maps should be segregated on the basis of fluid content or drawn irrespective of contacts. The Technical Committee members finally decided that the percent net to gross ratio maps are a reflection of rock quality and should be independent of fluid content. Therefore, it was recommended that Shell should construct these maps, using only the core and selected log control points applicable to each stratigraphic interval, for each of the two basal Grayburg zones. It was also agreed that Shell should submit these two percent net pay to gross thickness ratio maps to each Committee member in order to obtain approval prior to constructing the net pay oil and gas maps for each zone.

The techniques to be used for determining the remaining primary reserves were then discussed. The enclosed map shows the location of eight groups of wells that are within the proposed unit area and have remaining primary reserves. The majority of the wells are currently producing from one or more of the San Andres zones and the primary reserves for this group will be determined with the use of the reservoir simulation study which is now in progress. The remaining wells are producing from the Grayburg formation and/or the upper San Andres stringer zones. It is recommended that the primary reserves for these wells be determined by extrapolating production performance or by a similar type approximation. Individual decline curves have been prepared for 62 of these wells and each well has been categorized into one of six groups based on similar geographic location and producing characteristics. A composite production curve has also been prepared for each of the six groups and all lease production curves have been updated.

Each Committee representative present analyzed the production performance of these 62 wells, six composite group and eleven lease curves. The annual decline rate and corresponding initial rate was estimated for each of these curves. The reserves determined from these estimates will then be averaged for each curve and the results distributed to all of the Technical Committee members.

The "Well Status" tabulation has once again been revised and a corrected copy will be distributed. One of these elevation changes, to Continental State A-33 No. 4 (33 J), resulted in a redistribution of the amount of porosity-feet in the Zone I gas and oil columns and consequently contour changes to the porosity-feet maps in Zone I. These changes result in a net increase of 201 MMCF for the OGIP and a net decrease of 395,658 BO for the OOIP. Corrected sheets will be sent out to reflect these changes. These and all previous changes to the porosity-feet maps were shown to the Committee.

The need for determining current OIP, by tracts, was discussed. This parameter will be based on tract values of GOR (determined from previously constructed GOR contour maps for II, IIIU and IIIL zones and an average reservoir value for Grayburg and I) and water cut values (determined from contour map on I and estimated average reservoir values for the other zones). In addition to possible use as a parameter, these values will be used as the basis for apportioning secondary reserves to each tract.

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
January 13-14, 1976

The meeting was called to order at 9:30 AM. Fifteen companies, which operate 86 percent of the current producers, were represented (Attendance List is attached). The sole purpose of this meeting was to redetermine tract primary reserves for those wells producing from the Grayburg and/or upper San Andres stringers.

Mr. Swartz initiated the meeting with a review of work done to date for determining primary reserves. In summary, the primary reserves for the proposed North Hobbs Unit is being determined by two methods: (1) by analysis of production performance for all wells which are currently considered to be producing from the Grayburg and/or upper San Andres stringers and (2) by a reservoir simulation study (currently in progress) for all wells currently producing predominantly from the San Andres reservoir(s). There will be no overlap as each well has been placed in only one of the above categories.

A plan of attack was then developed by the Committee members. It was decided to first assign reserves to all of the applicable lease and composite groupings. Then wherever the lease production performance curve could not be used (i.e. when most of the current production on a lease is from wells completed in the San Andres reservoir); the reserves were estimated from the individual well decline curves. These curves have all been updated to include at least the production between January, 1972 and October, 1975. In many cases the November and December, 1975 production figures were also available as well as the production prior to January, 1972 for all of the one-well leases. The sum of all the wells within a group (groupings are described in prior correspondence) were then compared to the extrapolation of the applicable Composite Group curve as a check of the reserves so estimated.

All of these production performance curves were projected with a view graph and an annual decline rate (dy) and an initial 1/1/76 rate (q) was determined by those present. Complete agreement was obtained for each curve and the 1/1/76 reserves were calculated using an economic limit of one BOPD/well. These determinations are summarized on the attached tabulation and are considered to be final.

SHELL OIL COMPANY

P.O. BOX 991
HOUSTON, TEXAS 77001

January 20, 1976

Subject: Technical Committee Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

Technical Committee
(Addressee List Attached)

Gentlemen:

Attached are the minutes of the Technical Committee meeting which was held in Midland, Texas on January 13 and 14, 1976.

At this meeting the primary reserves were finalized for all wells which are currently producing from the Grayburg and/or upper San Andres stringers. This totals about 1.3 million barrels for 63 producers. Primary reserves for the remaining wells, which produce predominantly from the San Andres reservoir(s), are being determined with the use of a reservoir simulation computer program.

It would be greatly appreciated if each Company would return the ballots on the revised percent net pay to gross thickness ratio maps for the upper and lower Basal Grayburg Zones. (These were sent with letter dated December 31, 1975.) Once the volumetrics on the Grayburg are completed we will finalize a waterflood plan for this reservoir.

Yours very truly,

H. J. Swartz

H. J. Swartz, Chairman
Technical Committee

HJS:ELP

MINUTES OF THE TECHNICAL COMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
MARCH 25, 1976

The meeting was called to order at 9:15 AM. Fourteen companies, which operate 79 percent of the current producers, were represented. (Attendance list is attached). The main purposes of this meeting were to: (1) finalize net pay isopachs of the Grayburg formation, (2) present the results of a Grayburg waterflood evaluation on a 40-acre symmetry element and (3) decide on a waterflood plan for the Grayburg reservoir.

Mr. E. W. Kitchen presented a brief review of the method and decisions involved in the construction of the four Grayburg net pay isopach maps. Copies of these maps were mailed to each representative with the letter calling the meeting. After a brief discussion the maps were unanimously approved as drawn. It was requested that committee members review all maps submitted to them today for accuracy of information and data since these maps will be sent for drafting in final form shortly. The tract values of original hydrocarbons-in-place will be determined from these maps by use of the "gridding" technique with a ten-acre grid. Tabulations of the tract values and copies of the gridded maps will be sent to each operator for verification.

Mr. H. J. Swartz presented the results of a reservoir simulation study of the Grayburg formation. This analysis was done with the use of a three-phase, three dimensional, compressible fluid reservoir simulation program using a 40-acre symmetry element and a 9 by 17 grid system. The reservoir volume represented was 1028 NAF with an average porosity of 14 percent, water saturation of 30 percent and average permeability of 5 millidarcies. The value of permeability was determined by trial and error by comparing recent production history and water injectivities using the Moranco waterflood experience as a guide. Pseudo relative permeability curves were constructed using a Dykstra-Parsons variance factor of 0.7 (determined from 256 core samples) and a five layer stratification.

Based on the production history of 69 wells which were producing predominantly from the Grayburg, the average producing characteristics at January 1, 1975 were estimated to be 15 BOPD per well with a GOR of 5035 cubic feet per barrel. Fractional flow equations were used in conjunction with the pseudo relative permeability curves to relate this GOR to an average gas saturation of 19 percent and an average oil saturation of 51 percent. These values represent a cumulative oil recovery of 16.23 percent of the OOIP or about 10.2 million barrels, which fits prior estimates of cumulative oil production allocated to the Grayburg. The average reservoir pressure at January 1, 1975 was estimated to be 400 psig at 400 feet subsea.

Using these initial conditions, a base case was run to establish the results to be expected for continued primary depletion as a function of time. This analysis indicates that ultimate primary recovery (to an economic limit of one BOPD per well) would be 1098 STB per NAF or 18.7 percent of the OOIP. The January 1, 1975 reserves are 14.9 STB per NAF. Assuming that water injection would be initiated in mid-1978, this base case indicated that the average oil saturation at that time would be 48.6% and the reservoir pressure would be 220 psig.

A waterflood program using a five-spot pattern resulted in an ultimate recovery efficiency of 33.1 percent. This reflects an additional 84 STB/NAF (14.4%) of secondary oil per five-spot pattern. Economic analyses were made for this case and infill drilling. The effects of pattern skewness and shutting in producers to conserve reservoir energy were also evaluated with the computer program.

The conclusions reached from this study and discussions with the Technical Committee are summarized as follows:

(1) because of the low permeability of the Grayburg reservoir it will be necessary to use a pressurized injection system (about 1500 psig surface) and a ratio of one injector per producer (five-spot or line drive pattern).

(2) An 80-acre five-spot waterflood is economically attractive. However, a complete infill program (40-acre five spot) cannot be economically justified at this time. The flood performance is improved if high GOR-low oil rate producers are shut-in while injecting water during the 5-year fillup period.

(3) Final pattern selection and well utilization should be made after the San Andres water injection program is finalized.

At the Technical Committee meeting of December 5, 1974, special BHP buildup surveys were requested in four selected wells. It was agreed that the Technical Committee would recommend to the Working Interest Owners that an adjustment be made to any production parameter that incurred a production loss because of these BHP surveys. Several methods were discussed at this meeting and it was then decided to adjust any parameter affected by averaging each well's production for two months prior to the survey and two months afterwards and subtracting the actual production obtained during the survey month(s). The well involved and the adjustment are:

Well	Location	Date Shut-In	Hours SI	Adjustment (Bbls.)
Amerada McKinley 3	30C	1/06/75	67	240
Exxon Fed. Bow. 10	29L	12/30/74	70	200
Getty McKinley 2	30H	12/11/74	72	0
Marathon State 30-1	30K	12/02/74	67	589

It was requested that all Technical Committee representatives carefully review the "Well Status Summary" (last revised 10/15/75) mailed with our letter dated October 31, 1975, and advise H. J. Swartz (713-220-1022) whether or not the data are correct as shown.

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
October 13, 1976

The meeting was called to order at 9:00 a.m. Seventeen companies, which operate 90 percent of the current producers, were represented. (Attendance list attached). The main purpose of this meeting was to present the results of Shell's reservoir simulation study of primary recovery performance from the San Andres.

Mr. Swartz presented a brief review of the history of Technical Committee progress and emphasized the following points:

1. Attempts to form a fieldwide unit were aborted during 1975, primarily because of disagreement over the determination of remaining primary reserves.

2. Resolution of the problem of determining tract reserves (both primary and secondary) for the proposed North Unit should eliminate the last major hurdle for the Technical Committee.

3. The main complication for determining tract primary reserves is the existence of strong water influx into the upper San Andres (Zone I). This water drive is primarily from west to east and has caused an unusually large amount of oil migration and maintained the reservoir pressure and consequently the productivity of Zone I at higher levels than in the other productive intervals. This is particularly evident along the eastern flank of the proposed North Unit area.

4. Two prior methods for allocating tract primary reserves for the San Andres have been presented to the committee at meetings held on October 5, 1974 and November 7, 1974. Both were rejected and subsequent discussions led to the conclusion that the problem would best be resolved with the use of a reservoir simulation study.

5. A letter ballot, dated March 13, 1975, for a Shell computer study at a flat rate of $6000 (estimate based on computer time and outside clerical help only) was approved by 88.52 percent of the operators with only one dissenting vote.

6. Consequently Shell made a feasibility study and at a Technical Committee meeting held on June 4, 1975, Mr. W. C. Miller, section leader of the reservoir simulation group in Shell's research organization, presented a description of the mathematical model and techniques that would be used.

7. Primary reserves have already been determined by the use of production decline analysis for 62 wells which produce from the Grayburg and/or upper San Andres stringers. Please refer to the enclosed map (Figure 1) which shows those wells included in the reservoir simulation study.

8. Prior to completing the reservoir simulation study it was thought that it would be necessary for the Technical Committee to reallocate reserves to wells located in a common grid block. However, because of differences in completion zones and well model characteristics, it is believed by Shell that representative and equitable primary reserve determinations have been simulated on an individual well basis.

Mr. W. C. Miller then reviewed the premises, model description and the results of the history match. Discussion centered about the following points:

1. A 10 by 20 grid system, depicted in Figure 2 was superimposed on all completions in the field using a three-layer representation for the San Andres reservoirs (I, II and III_U/III_L).

2. All of the Technical Committee data developed to date were input for reservoir description. These include: Structure maps (fitted with curvilinear coordinates for a smooth surface as shown in Figure 3), individual well zonal porosity determinations, zonal original hydrocarbons-in-place (using the previous Engineering Committee work for the South Hobbs Unit area) and rock relative permeability curves modified to pseudo curves by stratification effects.

3. Oil production history, from initial completion to January 1, 1976, was input for every completion in the field after factoring out a minor amount attributed to the Grayburg formation on the basis of relative permeabilities and well storage differences in the completed intervals.

4. The actual well completion history (zone changes) were input in five-year intervals and the "current" (January 1, 1976) completion zones are shown in Figure 1. As previously decided by the Technical Committee, all wells producing in excess of 100 BWPD but not completed in Zone I were assumed to have behind pipe communication with that zone.

5. As previously discussed at previous sessions there are many indications of preferential flow channels. One obvious example is between two wells (29P and 28M) which although they are located about 700 feet apart and are both apparently completed in equivalent Zone I sections, one is a clean oil producer and the other makes in excess of 70 percent water cut. In view of this and other anomalous production performances it was necessary to establish flow channels (in Zone I only) in order to obtain a satisfactory history match. The transmissibilities of these flow channels were varied but it was found necessary to use a value of zero. The flow channels or barrier locations are depicted in Figure 4.

6. The quality of the history match was evaluated primarily by comparing the calculated zonal water production rates for each well to those reported to the New Mexico Conservation Commission during the year 1975. Attention was also focused on current zonal and areal reservoir pressure variations and comparisons with measured data reported at prior meetings. Figures 5 thru 10 represent both qualitative and quantitative comparisons of these data.

7. Shell believes that a good history match has been obtained, especially considering the interzonal interactions resulting from multicompletions, variations in reservoir pressure and selective completions intervals.

Following these discussions, Mr. W. C. Miller then presented the results of the prediction phase and emphasized the following points:

1. As decided by the Technical Commettee, the predict was run with each well retaining the current completion interval for the remaining life.

2. A top allowable well was assigned a January 1, 1976 bottom hole flowing pressure of 300 psi whereas the remaining wells were assumed to have 100 psi flowing bottom hole pressures. These top allowable wells are designated on Figure 11.

3. The permeability - thickness product of each well in each zone had been automatically varied throughout the history match to simulate actual performance. The last adjusted zonal kh for each well was kept constant during the predict mode.

4. The economic limit was arbitrarily selected to be 5 BOPD and/or 95 percent water cut and the prediction terminated at the end of year 2024.

5. It was assumed that those wells which contain a Grayburg completion with the main San Andres would not obtain any future primary reserves from the Grayburg because of the significant differences in permeability - thickness products and static reservoir pressures.

6. The predicted performance of each well was then summed into field, lease and operator totals which are summarized in Figures 12 thru 15 The estimated future rates were plotted on the enclosed lease production graphs. The previously estimated (by decline curve analysis) production for Grayburg and/or Upper San Andres producers has been added to the simulated predictions for the main San Andres wells where a lease contains wells in both categories.

Shell believes that the resulting predictions are reasonable and equitable projections of future performance. The economic limit was subsequently recalculated at the decontrolled stripper oil price and is 3 BOPD or 99 percent water cut, whichever is reached first. The results using the higher economic limit is labelled "Set A" whereas the recommended runs with the lower economic limit are designated as Set B. Figures 16 thru 19 are summary tables of actual and estimated primary oil performance from the San Andres reservoir for both the field and the proposed North Unit by zones and in total. Figure 20 is a summary of recent production statistics for the North Unit.

The Technical Committee members were asked to suggest variations to the simulation runs presented. None were suggested at the meeting but it was left open so that any Technical Committee representative wishing a variation in the assumptions should call the Chairman of this committee. It was requested that every one come to the next meeting on November 4, 1976, be prepared to vote on acceptance of this simulation study as the basis for tract primary reserves for those wells in the study area. Shell recommends using the San Andres primary reserves which are summarized in Set B. We feel that these represent equitable estimates and are much more representative than those obtained by methods previously suggested to the Technical Committee.

MINUTES OF THE TECHNICAL COMMITTEE
PROPOSED NORTH HOBBS UNIT
NOVEMBER 4, 1976

The meeting was called to order at 8:15 a.m. Thirteen companies, which operate 82 percent of the number of current producers, were represented. (Attendance list attached). The main purpose of this meeting was to vote on the acceptance of Shell's reservoir simulation study as the basis for the determination of primary reserves from the main San Andres reservoirs.

After considerable discussion and vote taking it was decided to take the following course of action:

1. Accept Shell's reservoir simulation approach as the best method for determining primary reserves from the main San Andres reservoirs.

2. Approve the techniques and mathematical descriptions used by Shell and as presented to the Technical Committee at the October 13, 1976 meeting by Mr. W. C. Miller of Shell Development. (Skelly registered the only no-vote based on the results obtained for their Turner lease relative to offsetting tracts.)

3. Approve the approach that the primary reserves parameter for those wells included in the reservoir simulation study would be based on the assumption that the current completion status (shown in Figure 1 attached to minutes of October 13, 1976 meeting) would be constant over the remaining life.

4. Update the reservoir simulation history match to include the first eight months of 1976 oil production. The determination of each well's permeability thickness (kh) should be based on the last twelve months of history. (Wells that have been shut in during July and August 1976 due to overproduction of gas would use the prior ten months (9/75 to 6/76) as the base for determining kh. These wells are: Arco Grimes SOC 1 and 2 (28E&F), Conoco Grimes 1, 2 and 4 (28O, P and I) and Conoco State A-29-3 (29K).)

5. Rectify an apparent discrepancy between actual production and computed production for the Getty Hardin Lease in Section 19.

6. Move the two Skelly Turner wells (34C and F) from grid block 12, 2 to grid block 12,1 in order to obtain a better match and representation.

7. Use an economic limit of 3 BOPD or 99 percent water cut and all production stopped on December 31, 2024.

Shell agreed to make the preceding changes and distribute the results of this analysis to all Technical Committee members (in approximately one week). Shell pointed out to the Committee representatives that this would be the final simulation run under the agreement set forth in the letter dated March 13, 1975 about the computer analysis for this field.

It was decided to reconvene in two weeks (November 17 and 18) to cover the agenda scheduled for this meeting.

In response to several requests for information on other participation parameters determined to date, a tabulation of ten parameters was distributed and a copy is enclosed with these minutes. Also a summary of a conservative economic analysis of a unitized waterflood was shown; a copy of that summary is also attached.

PRELIMINARY ECONOMIC ANALYSIS
PROPOSED NORTH HOBBS UNIT

ASSUMPTIONS:

1. ADDITIONAL OIL BY WATERFLOODING IS 30 MMB OR ABOUT 7% OF THE OOIP IN GB, II, III_U, III_L ZONES. (THE SECONDARY OIL RECOVERY OF 30 MMB IS EQUIVALENT TO A SECONDARY TO PRIMARY ULTIMATE RATIO OF 0.28 FOR THESE ZONES.) THE WATERFLOOD LIFE IS 35 YEARS.

2. CAPITAL INVESTMENT IS $16,000,000 INITIALLY AND $4,000,000 TWO YEARS LATER.

3. A CRUDE OIL PRICE OF $5.911 PER BARREL IS USED THROUGHOUT. THERE IS NO ESCALATION FOR OPERATING COSTS. THE OPERATING COSTS USED FOR THE WATERFLOOD ARE 44% HIGHER THAN THE EQUIVALENT FOR PRIMARY OPERATIONS TO PROVIDE FOR AN INCREASED AMOUNT OF WORKOVERS AND WATER COSTS (PURCHASING AND HANDLING).

RESULTS:

1. THE ADDITIONAL OCI (UNDISCOUNTED AND BEFORE FIT) IS $3.80 PER BARREL OF OIL. THE ADDITIONAL OCI (DISCOUNTED AT 10% AND BEFORE FIT) IS $1.75 PER BARREL OF OIL. THE AVERAGE ANNUAL EARNING POWER (BEFORE FIT) IS 33% AND THE PAYOUT OF THE CAPITAL INVESTMENT IS 4.1 YEARS. THE UNDISCOUNTED PROFIT IS $94 MILLION OR 470% OF THE REQUIRED CAPITAL INVESTMENT.

NOTE: THIS IS AN INTENTIONALLY CONSERVATIVE PROFITABILITY TO DEMONSTRATE AN ECONOMICALLY ATTRACTIVE PROSPECT EVEN WITH LOW OIL RECOVERIES AND HIGH COSTS.

Subject: Technical Committee Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

Technical Committee
Proposed North Hobbs Unit
(Addressee List Attached)

A two-day meeting of the Technical Committee is called for Wednesday and Thursday, November 17 and 18, 1976, at 8:00 a.m. in Conference Room 19109, Entex Building, 1200 Milam Street, Houston, Texas.

The agenda for this meeting is:

1. Vote on approval of Shell's reservoir simulation study for determining San Andres primary reserves by tracts. (See attached minutes).

2. Review primary reserve determinations made from decline curve analyses of wells producing from the Grayburg and/or upper San Andres stringers. (See Minutes of January 13 and 14, 1976, Technical Committee meeting). The production performance curves have been updated and there are some wells that have not yet been analyzed.

3. Discuss the procedure to be adopted for allocating secondary reserves to tracts.

4. Other business.

This agenda is the same as scheduled for the Technical Committee meeting held on November 4, 1976. Attached are the minutes of that session which show that only the first agenda item was discussed in detail. Whereas there is agreement with the assumptions and techniques used by Shell in their reservoir simulation study, sufficient modifications to the October 18, 1976 analysis (summarized in Figures 14 and 15 of the enclosures sent with the minutes of the October 13, 1976 meeting) were approved by the Technical Committee to justify an additional run. The results of this final run will be distributed to all Technical Committee representatives as soon as available (in approximately one week). We request that each Company representative attending the November 17 and 18, 1976 meeting be prepared to vote on the acceptance of the forthcoming computer analysis as the basis for the primary reserves unitization parameter.

Shell Oil Company now feels that they have fulfilled the intent and requirements set forth in our letter dated March 13, 1975 discussing the computer analysis for this field.

Yours very truly,

R. J. Swartz

HJS:ELP

R. J. Swartz, Chairman

#15

MINUTES OF TECHNICAL COMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
NOVEMBER 17 AND 18, 1976

The meeting was initiated with a brief review of the agenda and in particular the modifications that had been made to the Shell reservoir simulation study of the San Andres reservoirs primary performance. These changes had been requested by the Technical Committee at the November 4, 1976, meeting, are outlined in the minutes, and were at the time intended as the final computer run. The results of this analysis were transmitted to all members with letter dated November 10, 1976.

Shell moved that the results of the reservoir simulation study, summary of equity transmitted to all Operators on November 10, 1976, be used for the San Andres (main zones) tract primary reserve parameter. This motion was seconded by Amoco and the results of the vote were:

FOR (11) : Amerada, Amoco, Chevron (by telegram), Exxon, Getty, Gulf, Mobil, Samedan, Sun, Texas Pacific and Shell.

OPPOSED (3): Cities Service, Conoco and Skelly

The reasons for these objections were discussed and the respective positions are appended as follows: Cities Service (Attachment No. 1), Continental (Attachment No. 2) and Skelly (Attachment No. 3). Shell's response to each of the exceptions is noted at the end of each attachment.

A motion was made by Skelly that their two Turner wells (located in Section 34C and F) be assigned a Zone I primary reserve value of 540,000 barrels each (rather than the 319,000 and 321,000 barrel determination made by the last Shell computer run). All other wells would retain the assigned values shown in this final analysis. Samedan seconded the motion and the resulting vote was as follows:

FOR (2) : Getty and Skelly.

OPPOSED (11): Amerada, Amoco, Cities Service, Continental, Exxon, Gulf Mobil, Samedan, Sun, Texas Pacific and Shell.

A motion was then made by Shell that the Zone I primary oil reserves determined for the two Skelly Turner wells and three directly offsetting wells: Shell Sanger 2(27N), 514,000 barrels; Shell Turner 2(34B), 352,000 barrels; and Shell Turner 1(34G) 576,000 barrels; be arithmetically averaged and the resulting value (approximately 416,400 barrels) be assigned to each of these five wells. No other reserve values would be changed from those determined in the final run. Amoco seconded this motion and the results of the vote were:

FOR (7) : Amerada, Amoco, Gulf, Mobil, Sun, Texas Pacific and Shell

Opposed (4): Cities Service, Conoco, Exxon and Skelly

PASS (2) : Getty and Samedan

Getty requested the inclusion of their comments in the minutes. (See Attachment 4). Mr. W. E. Nolan stated Exxon's preference that no arbitrary adjustments affecting the tract reserve determinations be made.

After additional discussions about alternative proposals to resolve the disagreements (none were finalized as motions), it was decided by the Chairman of the Technical Committee that the results of the "final" Shell reservoir simulation study (first motion) would be submitted to the Working Interest Owners as the San Andres (main zones) primary reserve parameter. This decision was based on the observation that no constructive alternatives had been recommended and whereas it was a controversial determination it had received the most support from the representatives. Furthermore, based on current and prior discussions it appeared that all of the objections were directly related to equity and the disagreements could therefore best be resolved by the Working Interest Owners. The Technical Committee should now continue with their assigned task to determine the economic feasibility of unitized Supplemental Recovery operations and the development of additional parameters. Meanwhile Shell will continue to search for an alternative solution to the primary reserves parameter that would be acceptable to everyone.

The next agenda item was to review primary reserve determinations made from decline curve analyses of those wells producing from the Grayburg and/or upper San Andres stringers. (See minutes of January 13 and 14, 1976, Technical Committee meeting.) The production performance of these wells had been updated to include an additional ten months of history and there were several wells that had not previously been analyzed. Viewgraphs of each updated production performance graph marked with the previously determined initial oil rate (at 1/1/76) and the annual decline rate assigned were shown and reviewed for any necessary adjustments. The results of these evaluations are tabulated in Attachment No. 5. As noted in this summary, twelve revisions were made. Also, seven graphs were classified as erratic performance requiring further analysis and one new lease was added. This tabulation of course represents the current analysis and replaces the summary previously transmitted with the minutes of the January 13 and 14, 1976 Technical Committee meeting.

A description of the problems involved with determining the tract secondary reserve potential for the Grayburg reservoir were presented. The meeting was then adjourned for the day. The Thursday meeting began with a quick review of the results of Shell's reservoir simulation study of the Grayburg waterflood potential. These results had been presented and accepted at the

Technical Committee meeting held on March 25, 1976. That presentation included only the results expected from a five-spot waterflood pattern of the Grayburg formation using the average reservoir characteristics found along the northern and western flanks of the field. Those areas are currently developed by 67 Grayburg wells which can conveniently be converted to an 80-acre five-spot waterflood pattern. Because of the low permeability of the Grayburg net pay it will be necessary to use a pressurized water injection system with an expected surface injection pressure of about 1500 psig. Because of this fact and the small casing sizes it appears impractical to either simultaneously or dually inject water into both the Grayburg and San Andres in the same wellbore. Herein lies the problem. The availability of "Grayburg only" wells will permit the secondary recovery development of about one-half of the original-oil-in-place. The remaining potential is underlain and developed by more prolific San Andres producers. In light of past history it is doubtful that high pressure water injection could be mechanically confined to the Grayburg in most of these wells.

It was decided by the Technical Committee that Shell should make the following determinations:

(1) Quantify the volume of Grayburg reservoir that can be affected by an 80-acre five-spot waterflood pattern with currently available wells. This volume should include the expected encroachment of water beyond the normal well pattern in accordance with a 1955 report by Caudle et al. (See Page 57 of the AIME Monograph Volume 3 by Forrest F. Craig, Jr.)

(2) Evaluate the economic feasibility of drilling Grayburg water injectors but utilizing existing producers for drainage points in the reservoir volume not encompassed in Item 1. This evaluation would also be based on an 80-acre five-spot pattern, upper tier oil price, constant revenue and costs, before federal income taxes, and values discounted at 10 percent and undiscounted. It will be assumed that water injection would be initiated in mid-1979 and the reservoir pressure at that time in this area would be 400 psig.

These determinations should establish what volumes of the Grayburg reservoir can economically be exploited with a waterflood.

Considerable discussion then ensued on the best method to be used in determining the San Andres waterflood potential. Shell had planned to make a reservoir simulation study by modelling the Zone III_L reservoir in its entirety in the northern unit area. Average oil saturations at the start of water injection were to be determined for each floodable zone (II, III_U and III_L) from the recently completed San Andres primary performance simulation study by Shell.

Waterflood recovery would then be evaluated for several cases with different location and number of injectors and producers. However, in view of the previously described controversies about that primary performance simulation study (see Attachments 1, 2, 3 and 4) it was decided that it would be preferable to evaluate the secondary recovery potential of the San Andres by analogy with existing waterfloods in similar reservoirs the West Texas - New Mexico area. Consequently, each representative was requested to supply the Chairman with data on this type of project. However, in order to avoid duplication of effort and incomplete data, Shell will send out a letter requesting specific data from the operator of specific selected projects. Shell will then summarize and average these data and the Technical Committee will then determine the San Andres secondary reserves volumes to be used for the North Hobbs Unit by applying a recovery factor to the OOIP (Zones II, III_L and III_U) for each tract.

It was requested by the Committee that Shell review the computed saturations and reservoir pressures in the latest simulation run to ascertain that significant differences do not exist between grid blocks during mid-1979. Subsequent to the meeting, it was established by Shell that the pressure gradient existing between grid blocks in the North Unit Area averaged 21 psi in Zone II and 16 psi in Zone III and that the saturation differences were not significant for these floodable San Andres zones. The average reservoir pressure in both zones is 580 psig at mid-1979. Shell will continue to design a waterflood plan and present a recommendation to the Technical Committee.

It was estimated that the next meeting would be held in mid-January and be relative to the aforementioned waterflood analyses.

ATTACHMENT NO. 1

OBJECTION BY CITIES SERVICE OIL COMPANY

Cities Service Oil Company believes that the computed San Andres primary reserves for their B. Hardin lease (NW/4 Section 19) are too low and do not properly reflect the remaining value of this lease. This contention is based on the observation that this tract has higher equity values (percent in the proposed North Hobs Unit) in the following parameters: useable wells 2.075%, active wells 1.810%, cumulative oil production (to 1/1/76) 2.079%, current oil production (1st 7 mos. 1976) 1.058%, San Andres OOIP 2.984% whereas the computed primary reserves are equivalent to only 0.693% of the unit total.

SHEL OIL COMPANY RESPONSE TO CITIES SERVICE OIL COMPANY'S OBJECTION

It is recognized that there is a considerable range in the many parameters -- that is the very reason for developing them. The history match for the 4 wells on this lease is quite adequate. One well is now at the economic limit applied to all wells in the simulation (3 BOPD) and is not credited with any reserves. The remaining wells average only 26 B/D oil production by solution gas drive in Zone 3. The predicted reserve of 86.000 barrels per well gives a reserve to production ratio of a reasonable 9.1 years.

ATTACHMENT NO. 2

OBJECTION BY CONTINENTAL OIL COMPANY

Continental Oil Company objects to the use of an arbitrary time cutoff in the reservoir simulation study for determining San Andres primary reserves, which in effect produces some wells to the economic limit while many others are producing at rates above the economic limit at the cutoff date. Continental believes each well should be carried to the economic limit and thereby credited with reserves in a manner consistent with every other well.

SHELL OIL COMPANY'S RESPONSE TO CONTINENTAL OIL COMPANY OBJECTION

Continental Oil Company raises a valid point when they suggest that all wells should be treated alike and be allowed to produce until they reach an economic limit of 3 BOPD or 99 percent water cut. However if this is done for this study some of the well lives would probably be extended an additional 50 years or a total future life of about 100 years. Shell feels that it is not realistic to expect this type of well service. The cutoff time chosen (2025.0) is arbitrary and was based on several factors such as: now is mid-point in life, recovery efficiencies are already high, discounted values after 50 years are extremely low, and reservoir pressure at 2025.0 in the depletion drive reservoirs are very low (251 psi in Zone II and 170 psi in Zone III).

ATTACHMENT NO. 3

OBJECTION BY SKELLY OIL COMPANY

Skelly Oil Company does not approve the techniques and mathematical descriptions used for the determination of the San Andres Zone 1 primary reserve parameter. Skelly believes that its B.H. Turner Lease, which has two flowing 80 BOPD and 0 BWPD wells, is not being treated justly. The following is an illustration of this stated inequity using only the comparison of second row San Andres Zone 1 producers:

Operator	Lease & Well No.	Cur. Prod. Rate*	% Wtr. Cut	Zone 1 Rem. Prim. Resr.*
Samedan	Moon "A" #2	64 BOPD & 19 BWPD	23%	475,000 Bbls.
Samedan	Moon "B" #1	67 BOPD & 0 BWPD	0%	656,000 Bbls.
Shell	Sanger #3	80 BOPD & 7 BWPD	8%	638,000 Bbls.
Shell	Sanger #1	80 BOPD & 10 BWPD	11%	513,000 Bbls.
Skelly	Turner #2	80 BOPD & 0 BWPD	0%	319,000 Bbls.
Skelly	Turner #1	80 BOPD & 0 BWPD	0%	320,000 Bbls.
Samedan	Turner"A"#1	50 BOPD & 19 BWPD	28%	460,000 Bbls.
Samedan	Turner"A"#2	57 BOPD & 19 BWPD	25%	495,000 Bbls.
Other Operator's Average Well		66 BOPD & 12 BWPD	15%	540,000 Bbls.
Skelly's Average Well		80 BOPD & 0 BWPD	0%	320,000 Bbls.

Note: The two Sekly wells are the only 80 BOPD, zero water cut, flowing, Zone 1 wells in this portion of the field.
*Based on Aug. Prod. Figures & Shell's Run "C" on the simulator.

A previous indication of this inequity for the Skelly Turner wells was noted in the committee after review of stimulator run "B" which allocated only 403,000 BBLS. per well for Zone 1 remaining primary reserves. At that time the committee agreed to move the two Skelly Turner wells to another grid block in order to obtain better representation of the Skelly Wells. (See Item No. 6 in the minutes of the November 4, 1976 Technical Committee Meeting which was prepared by Shell).

SHELL OIL COMPANY'S RESPONSE TO SKELLY OIL COMPANY OBJECTION

The migration of oil in Zone I has been clearly established as being controlled by edge water encroachment which is from the southwest in the vicinity of the Skelly Turner lease. This natural water influx negates structural advantages and places a premimum on distance from the watered out area, placing the Skelly lease at an unfavorable geographical location. Also the Skelly wells should not be compared to the two Samedan Moon wells which are located 6000 and 4500 feet from the nearest Skelly producer and are affected by different migration characteristics.

It should be noted that Skelly Turner 1 is no longer a top allowable producer. During the first eight months of 1976 this well has produced 88,293 MCF of gas or an overproduction of 19,973 MCF. The well will have to be shut in for 71 days to makeup for the excessive gas and Skelly has advised us that this well also overproduced the gas allowable during September. Clearly a top allowable oil producer, even if it is pumped because it makes some water production, is more desirable than a clean flowing oil well that is GOR penalized. Furthermore, if an adjacent lease is producing water it is indicative that the clean wells will soon produce water if they are opened to production in correlatable zones.

ATTACHMENT NO. 6

COMMENTS BY GETTY OIL COMPANY

Getty Oil Company requests the following comments be included in the minutes of the Technical Committee Meeting of the proposed North Hobbs, Lea County, New Mexico for consideration by the working interest owners' management representatives:

Getty Oil Company believes that numerical reservoir simulation is one of the most valuable tools available in the petroleum industry today for prediction of reservoir behavior. We use this tool often. We recognize both advantages and disadvantages of the tool. We believe that overall Shell Oil has done a good job in the numerical reservoir simulation of the proposed unit. However, some local discrepancies, such as in the area of the Skelly Turner lease, do exist and are not to be unexpected in this particular simulation for the following reasons:

(1) Although a three-dimensional model was used, there are only three layers in the vertical dimension; each representing a completely separate lithologic zone. This is offset to a degree by the use of pseudo relative permeabilities to represent stratification in each of the zones.

(2) A large areal grid size was used. In the majority of the cases, not only are there no grid blocks between wells, there is more than one well in most grids.

(3) Actual data shows that in some cases there are high water producers adjacent to low water or clean producers. Many no-flow boundaries were used during the history match to account for these occurrences.

(4) History matching does not present a unique solution. Even though the simulator accurately performs the calculations of the applicable physical phenomena, the simulator user inputs his own judgement decisions as to modifications of the original input so that computed and actual past performance are as close as practicable.

In summary, Getty Oil Company believes that overall the Shell Oil numerical reservoir simulation provides the best estimates of remaining primary recovery by tracts or wells and fluid saturations for determination of distributions to waterflood recovery. However, for the above stated reasons, the subject simulation results should be tempered by other available data in order to avoid obvious errors such as, but not necessarily restricted to, the area of the Skelly Turner lease.

SHELL OIL COMPANY'S RESPONSE TO GETTY OIL COMPANY COMMENTS

Shell appreciates Getty's concurrence that overall, the simulation provides the best estimates of remaining primary recovery by tracts or wells. As we have emphasized in Committee Meetings, for determination of primary reserves under the conditions which prevail at Hobbs, adequate detail is provided by the model described by Getty under their points 1 to 4. The key features of Hobbs' performance are represented by the use of three distinct zones, 127-acre grid blocks, and flow channels in Zone I (whose boundaries are represented mathematically as no-flow interfaces between certain grid blocks). As Shell stated in these meetings, for other objectives, e.g., to evaluate supplemental recovery by pattern waterflooding, smaller grid blocks would be required. Finally, it is not apparent that there are errors in the area of the Skelly Turner lease. Certainly, the history match obtained on the two Skelly wells and on the offset wells is quite adequate.

			Production Rates			
Well	Operator		Oil B/D	Gas MCF/D	Water B/D	Completion Zones
34C	Skelly	Calc.	79	73	21	1,2
		Actual*	79	85	0	
34F	Skelly	Calc.	80	74	21	1,2
		Actual*	80	310!	0	
34B	Shell	Calc.	80	47	21	1
		Actual*	80	93	13	
34G	Shell	Calc.	80	236	29	1,2
		Actual*	80	87	16	
27N	Shell	Calc.	80	56	21	1,2
		Actual*	80	215	7	

* Arithmetic average of last 12 months of production available (Sept. 1975 thru Aug. 1976).

One possible exception is in the comparison of some calculated and reported gas rates. The simulation does not reflect either the gas rate in Shell's 27N or even higher gas rate in Skelly's 34F (which subjects the latter well to shut-down in the latter part of 1976). Although the net effect upon predicted reserves is somewhat favorable to the Skelly well, we believe that such very localized regions of higher than average gas saturations have only a second order.

Finally, with regard to water rates, on the basis of an examination of the well records of all the wells producing from the several zones in the field, there is little significant distinction between wells making 20 B/D water or less (in this case, between 0 B/D water and 16 B/D).

Notes: * Economic Limit assumed to be one BOPD/well.

** New well with erratic production. Reserves are arithmetic average of 4 offset wells (TOPC ST. V AC-1, 2 wells; Amer. St. WNB 1, and Shell State F-3)

*** Add wells recently recompleted; will assign reserves at a later date.

R Revision to prior estimate.
U May change. Update later and review.

#1

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
January 13, 1977

Thirteen companies, which operate 81 percent of the current producers, were represented. (Attendance list is attached). The main purpose of this meeting was to finalize the tract secondary reserves for the unit.

Discussion was initiated with a brief review of the reservoir simulation study by Shell of the Grayburg waterflood potential. These results had been previously presented to the Technical Committee at a meeting held on March 25, 1976. The main conclusions are:

(1) Because of the low permeability it is necessary to use a pressurized water injection system (1500 psig surface) and a five-spot waterflood pattern.

(2) Primary ultimate recovery efficiency is 18.7 percent and secondary recovery efficiency is 14.4 percent for a symmetrical closed five-spot pattern.

(3) An 80-acre five-spot pattern waterflood, using existing wells, is economically attractive but will have a long life (43 years) and a relatively low response. A complete infill drilling program to obtain 40-acre five-spot patterns cannot be economically justified. The questions that needed to be resolved at this meeting are:

(1) What reserves should be assigned to the unit to discount the recovery efficiency of 14.4 percent for idealized conditions by the factors of well availability, non-symmetrical five-spots and incomplete patterns? and (2) On what basis should the unit secondary reserves be assigned to each tract?

A study was presented by Shell to show the expected encroachment of injected fluids beyond the normal well pattern (based on studies by Caudle et al, Petroleum Transactions, AIME (1955) 204, 79-85) and reduced sweep efficiencies due to incomplete patterns (based on results published by Craig, AIME Monograph, Volume 3, Chapter 5). The application of these techniques was approved by the Committee and resulted in unit secondary oil reserves of 6,560,000 barrels for a recovery efficiency of 10.6 percent of the OOIP. This is equivalent to a secondary reserve to primary ultimate ratio of 0.57 and requires the drilling of one injector at location 29D. It was decided by the Committee that this volume of secondary reserves should be apportioned to each tract on the basis of the tract OOIP.

It was pointed out that apparently the 320-acre Noranco Rice (Section 13) and Hardin (Sec. 18) leases were experiencing favorable response to Grayburg water injection. The October 1976 oil production from the Hardin tract is 1211 barrels (3 producers) which is the highest production level since 1963. In addition, the GOR has significantly decreased to 2695 cubic feet per barrel oil. Waterflood response from the Rice lease is not as pronounced but still encouraging. Water injection was started in August 1971, but has not been continuous.

At the last Technical Committee meeting it had been decided that San Andres secondary reserves should be determined by analogy with existing San Andres waterfloods in the vicinity that exhibited similar reservoir characteristics. Performance data on 8 such projects were reviewed and averaged a total recovery efficiency of 35 percent with a secondary to primary ratio of 0.85. It was noted that the volumetrically weighted permeability for these projects was 11 millidarcies whereas only two of the projects had average permeabilities as high as the North Hobbs Unit average for Zones II, III_U and III_L (28 millidarcies) and the ultimate recovery efficiency for those two floods are predicted to be 39.4 and 46.4 percent. Their secondary to primary ultimate recovery ratios are 0.43 and 0.68.

A Shell reservoir simulation study of the Zone III_L resulted in a primary recovery efficiency of 24 percent and a secondary recovery efficiency of 20 percent. The ultimate recovery efficiency is 44 percent and a secondary to primary ratio of 0.82. This study assumed a residual oil saturation of 35 percent in the swept zone and the final average saturation of 39 percent is equivalent to a sweep efficiency of 89 percent. It was pointed out that the San Andres Zone III_L is probably the most amenable to waterflooding because of the localized area and shape of the reservoir development.

Based on the foregoing, the Technical Committee determined that the ultimate oil recovery efficiency for the San Andres Zones II, III_U and III_L will be 40 percent. This should result in a secondary reserve for these zones of 48,640,000 barrels of oil. These recoveries are equivalent to an average residual oil saturation of 41.4 percent with a sweep efficiency of 85.1 percent. The ultimate recoveries for each zone in the proposed unit area are summarized in the attached tabulation. The Technical Committee also decided that the secondary reserves for the San Andres should be allocated to each tract on the basis original oil in place for each of the three zones.

Discussion then revolved about the scheduling of future work required for the Technical Committee to complete the charges by the Working Interest Owners. The following tentative schedule was developed: (1) determine the economics of waterflooding of both the Grayburg and San Andres reservoirs, (2) finalize the Grayburg primary reserves, by decline curve analysis, as soon as the production statistics are available through December 1976, and (3) prepare the Technical Committee report (tentatively scheduled for April 1977).

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
March 2, 1977

Twelve companies, which operate 83 percent of the current producers, were represented. (Attendance list is attached.) The main objectives of this meeting were to finalize the primary reserve determinations and to review the capital investment requirements and economics of waterflood operations.

The first agenda item was to finalize tract primary reserves for wells producing from the upper San Andres stringers and/or the Grayburg reservoirs. The last estimates had been made on November 11, 1976 and were based on production through August 31, 1976. The production performance graphs have now been updated to include the results through December 31, 1976. The oil reserves for the proposed North Unit area (as of January 1, 1977) were determined to be 1,485,275 barrels and are summarized by tracts on an attachment.

The next agenda item was to determine the method to be used to allocate the oil production from the last four months of 1976 in order to update tract primary reserves computed for wells producing from the main San Andres reservoirs. These reserves have been determined (as of September 1, 1976) with the use of a reservoir simulation program. (Please refer to the minutes of the Technical Committee meeting held on November 17 and 18, 1976.) Two alternatives were considered: 1) Use of computer program predict mode to estimate the zonal allocation of actual production for the last four months of 1976 on a unit basis and determine the tract zonal reserves by applying the same tract percentages previously determined or 2) use the computer program predict mode to estimate the zonal allocation of actual production for the last four months of 1976 on a tract basis and determine the tract zonal reserves by subtracting those values from the previously determined tract reserves (as of September 1, 1976). The latter method was selected; this may result in a slight change in the ratio of tract reserves to unit reserves that were previously furnished to you. Copies of the revised tract values will be mailed to you as soon as available.

A discussion was then initiated about an alternative solution to the computed reserves for the Getty (Skelly) Turner lease located in Section 34. The problem is described in the minutes of the Technical Committee meetings held on November 4, 1976, and November 17 and 18, 1976. The following motion was made by Samedan and seconded by Shell: The Technical Committee accepts the remaining primary oil reserves for the main San Andres zones as determined by the reservoir simulation run of November 8, 1976 (summary of equities transmitted to all Operators with letter dated November 10, 1976) except for a manual adjustment to the zone I primary oil reserves for five direct offset wells (Getty-Skelly Turner 1 (34F) and 2 (34C), Shell Turner 1 (34G) and 2 (34B) and Shell Sanger 2 (27N)) to correct an anomaly in misalingment of the simulator grid in that zone. The remaining zone I primary oil reserves (as of September 1, 1976) for each of those five wells is 416,437 barrels. The results of the vote were:

FOR (10): Amerada, Amoco, Exxon, Getty, Gulf, Mobil, Samedan, Sun, Texas Pacific and Shell
OPPOSED (1): Continental
PASS (1): Cities Service

The primary reserve parameter will therefore reflect this adjustment.

The next agenda item was a review of the economics of secondary recovery operations for this unit. A total capital investment of $24,600,000 will be required to waterflood the Grayburg and San Andres Zones II_L, III_U and III_L reservoirs. This amount includes $11,000,000 for centralized production facilities with fourteen satellite stations, $7,000,000 for the injection system and $600,000 for the source water gathering system. The Grayburg flood design is based on an 80 - acre five - spot pattern consisting of 40 injectors and 44 producers. One injector will be drilled. The expected waterflood recovery of 7.6 million barrels (6.6 secondary and 1.0 primary) should be produced in 36 years with a peak production rate of 1298 barrels of oil per day reached after 10 years of water injection. The San Andres flood design is based on a modified nine - spot injection pattern with an approximate spacing of 160 acres and consisting of 27-1/2 injectors (60 well zones) and 116 producers (192 well zones). Five unit producers and 14-1/2 unit injectors will be drilled which includes five (2-1/2 unit) injectors drilled along the common boundary with the Amoco-operated South Hobbs Unit. The expected waterflood recovery of 61.9 million barrels (48.6 secondary and 13.3 primary) should be obtained in 35 years with the peak oil production rate of 9280 barrels of oil per day occurring 8 years after the start of water injection and remaining flat for seven years. The oil and water production rates and volumes and water injection requirements are based on reservoir simulation studies on both the Grayburg and San Andres Zone III_L which have been previously reported. Copies of detailed cost estimates (captial and operating costs) and production functions were handed out to all in attendance and are available on request to those not attending.

The differential profitability analysis for the combined Grayburg - San Andres secondary oil additions of 55.2 million barrels yeild an undeferred before tax profit of $334 million (1359 percent) and a before tax profit, discounted at 10 percent, of $80 million (350 percent) based on constant dollars. Payout occurs in 6 years and the before tax earning power is 28 percent.

Attendance List
Technical Committee Meeting of March 2, 197[illegible]

#17

SHELL OIL COMPANY

P.O. BOX 991
HOUSTON, TEXAS 77001

March 8, 1977

Subject: Technical Committe Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

Technical Committee
(Addressee List Attached)

Attached are the minutes of the Technical Committee meeting held in Houston on March 2, 1977.

At this session the Technical Committee updated the primary oil reserve determinations to include production through December 31, 1976. In addition it was agreed to make a manual adjustment to the reserves calculated with the reservoir simulation program for five offsetting wells in Section 27 and 34. The Technical Committee also reviewed the estimates of capital investments requirements and the economics of waterflood operations.

This will probably be the final meeting of the Technical Committee prior to the publication of the Report in April. Attached is copy of the Well Status tabulation which has been updated to reflect the conditions as of January 1, 1977. It would be appreciated if each operator would again review this summary and advise me of any errors.

Yours very truly,

H. J. Swartz

H. J. Swartz, Chairman

UNIT OPERATING AGREEMENT
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT
LEA COUNTY, NEW MEXICO

THIS AGREEMENT, entered into as of the 1st day of July, 1978, by the parties who have signed the original of this instrument, a counterpart thereof, or other instrument agreeing to be bound by the provisions hereof;

WITNESSETH:

WHEREAS, the parties hereto as Working Interest Owners have executed, as of the date hereof, an agreement entitled "Unit Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico", herein referred to as "Unit Agreement", which among other things, provides for a separate agreement to be entered into by Working Interest Owners to provide for the development and operation of the Unit Area as therein defined;

NOW, THEREFORE, in consideration of the mutual agreements herein set forth, it is agreed as follows:

ARTICLE 1
CONFIRMATION OF UNIT AGREEMENT

1.1 Confirmation of Unit Agreement. The Unit Agreement is hereby confirmed and by reference made a part of this agreement. The definitions in the Unit Agreement are adopted for all purposes of this agreement. If there is any conflict between the Unit Agreement and this agreement, the Unit Agreement shall govern.

1.2 Additional Definitions. For the purpose of this agreement, the following terms and expressions as used herein shall mean:

(a) "Investment Participation" shall mean the sum of .58 Phase II Unit Participation and .42 Phase III Unit Participation.

(b) "Investment Readjustment Date" shall mean the date of termination of Phase II or January 1, 1991, whichever is the earlier date."

ARTICLE 2
EXHIBITS

2.1 Exhibits. The following exhibits are incorporated herein by reference:

2.1.1 Exhibits A, B, C and D of the Unit Agreement.

2.1.2 Exhibit E, attached hereto, is a schedule showing the Tract Participation, the Unit Participation, and the Investment Participation of each Working Interest Owner. Exhibit E, or a revision thereof, shall not be conclusive as to the information therein, except it may be used as showing the Unit Participations of Working Interest Owners for purposes of this agreement until shown to be in error or revised as herein authorized.

2.1.3 Exhibit F, attached hereto, is the Accounting Procedure applicable to Unit Operations. If there is any conflict between this agreement and Exhibit F, this agreement shall govern.

2.1.4 Exhibit G, attached hereto, contains insurance provisions applicable to Unit Operations.

2.1.5 Exhibit H, attached hereto, is a form of Indemnity Agreement required under the provisions of Section 14(c) of the Unit Agreement.

2.2 Revision of Exhibits. Whenever Exhibits A, B or C are revised, Exhibit E shall be revised accordingly and be effective as of the same date. Unit Operator shall also revise Exhibit E from time to time as required to conform to changes in ownership of which Unit Operator has been notified as provided in the Unit Agreement.

2.3 Reference to Exhibits. When reference is made herein to an exhibit, it is to the exhibit as originally attached, or, if revised, to the last revision.

ARTICLE 3
SUPERVISION OF OPERATIONS BY WORKING INTEREST OWNERS

3.1 Overall Supervision. Working Interest Owners shall exercise overall supervision and control of all matters pertaining to Unit Operations pursuant to this agreement and the Unit Agreement. In the exercise of such authority, each Working Interest Owner shall act solely in its own behalf in the capacity of an individual owner and not on behalf of the owners as an entirety.

3.2 Specific Authorities and Duties. The matters with respect to which the Working Interest Owners shall decide and take action shall include, but not be limited to, the following:

3.2.1 Method of Operation. The method of operation, including any type of pressure maintenance, enhanced recovery, or other recovery program to be employed.

3.2.2 Drilling of Wells. The drilling of any well whether for production of Unitized Substances, for use as an injection well, or for other purposes.

3.2.3 Abandonment and Change of Status of Wells. The abandonment of any well or change of status of any well by converting such well for use as an injector or for any purpose other than production of Unitized Substances.

3.2.4. Expenditures. The making of any single expenditure in excess of twenty-five thousand dollars ($25,000); provided that, approval by Working Interest Owners of the drilling, reworking, deepening, or plugging back of any well shall include approval of all necessary expenditures required therefor, and for completing, testing, and equipping the well, including necessary flow lines, separators, and lease tankage.

3.2.5 Disposition of Unit Equipment. The selling or otherwise disposing of any major item of surplus Unit Equipment, if the list price of new equipment similar thereto is seven thousand five hundred dollars ($7,500) or more.

3.2.6. Appearance Before a Court or Regulatory Agency. The designating of a representative to appear before any court or regulatory agency in matters pertaining to Unit Operations; provided, however, that Unit Operator shall act as such representative in the absence of the designation of a different representative by Working Interest Owners, and provided, further, that such designation shall not prevent any Working Interest Owner from appearing in person or from designating another representative in its own behalf.

3.2.7 Audits. The auditing of the accounts of Unit Operator pertaining to Unit Operations hereunder; however, the audits shall

(a) not be conducted more than once each year except upon the resignation or removal of Unit Operator, and

(b) be made upon approval of the owner or owners of a majority of Working Interest other than that of Unit Operator, at the expense of all Working Interest Owners other than Unit Operator, or

(c) be made at the expense of those Working Interest Owners requesting such audit, if owners of less than a majority of Working Interest, other than that of Unit Operator, request such an audit, and

(d) be made upon not less than thirty (30) days' written notice to Unit Operator.

3.2.8 Inventories. The taking of periodic inventories under the terms of Exhibit F.

3.2.9 Technical Services. The authorizing of charges to the joint account for services by consultants or Unit Operator's technical personnel not covered by the overhead charges provided by Exhibit F.

3.2.10 Assignments to Committees. The appointment of committees to study any problems in connection with Unit Operations.

3.2.11 The removal of Unit Operator and the selection of a successor.

3.2.12 The enlargement of the Unit Area.

3.2.13 The adjustment and readjustment of investments.

3.2.14 The termination of the Unit Agreement.

ARTICLE 4
MANNER OF EXERCISING SUPERVISION

4.1 Designation of Representatives. Each Working Interest Owner shall inform Unit Operator in writing of the names and addresses of the representative and alternate who are authorized to represent and bind such Working Interest Owner with respect to Unit Operations. The representative or alternate may be changed from time to time by written notice to Unit Operator.

4.2 Meetings. All meetings of Working Interest Owners shall be called by Unit Operator upon its own motion or at the request of two (2) or more Working Interest Owners having a total voting interest of not less than ten percent (10%). No meeting shall be called on less than fourteen (14) days' advance written notice, with agenda for the meeting attached. Working Interest Owners who attend the meeting may amend items included in the agenda and may act upon an amended item or other items presented at the meeting; provided, however, that no expenditure or commitment for expenditure may be authorized unless it is included in the agenda attached to the notice of the meeting. The representative of Unit Operator shall be chairman of each meeting. The parties hereto may reduce the notice requirement to not less than three (3) days and may waive the requirement for an attached agenda by consent of Working Interest Owners having a combined voting interest not less than that required for an affirmative vote under the provision of Section 4.3.2.

4.3 Voting Procedure. Working Interest Owners shall decide all matters coming before them as follows:

4.3.1 Voting Interest. Each Working Interest Owner shall have a voting interest equal to its Phase II Unit Participation during Phase I and Phase II and equal to its Phase III Unit Participation during Phase III, depending upon which phase is in effect at the time the vote is taken.

4.3.2 Vote Required. Unless otherwise provided herein or in the Unit Agreement, Working Interest Owners shall determine all matters by the affirmative vote of Working Interest Owners have a combined voting interest of at least sixty-five percent (65%); however, should any one Working Interest Owner have more than thirty-five percent (35%) voting interest, its negative vote or failure to vote shall not defeat a motion, and such motion shall pass if approved by Working Interest Owners having a majority voting interest, unless one or more Working Interest Owners having a combined voting interest of at least five percent (5%) likewise vote against the motion or fail to vote.

4.3.3 Vote at Meeting by Nonattending Working Interest Owner. Any Working Interest Owner who is not represented at a meeting may vote by letter or telegram addressed to the representative of the Unit Operator if its vote is received prior to the vote on the item.

4.3.4 Poll Votes. Working Interest Owners may vote on and decide, by letter or telegram, any matter submitted in writing to Working Interest Owners. If no meeting is requested, as provided in Section 4.2, within seven (7) days after a written proposal is sent to Working Interest Owners, the vote taken by letter or telegram shall become final. Unit Operator will give prompt noice of the results of such voting to all Working Interest Owners.

ARTICLE 5
INDIVIDUAL RIGHTS OF WORKING INTEREST OWNERS

5.1 Reservation of Rights. Working Interest Owners severally reserve to themselves all their rights, except as otherwise provided in this agreement and the Unit Agreement.

5.2 Specific Rights. Each Working Interest Owner shall have, among others, the following specific rights:

5.2.1 Access to Unit Area. Access to the Unit Area at all reasonable times to inspect Unit Operations, all wells, and the records and data pertaining thereto.

5.2.2 Reports. The right to receive from Unit Operator, upon written request, copies of all reports to any governmental agency, reports of crude oil runs and stocks, inventory reports, and all other information pertaining to Unit Operations. The cost of gathering and furnishing information not ordinarily furnished by Unit Operator to all Working Interest Owners shall be charged to the Working Interest Owner that requires the information.

ARTICLE 6
UNIT OPERATOR

6.1 Unit Operator. Shell Oil Company is hereby designated as the Unit Operator.

6.2 Resignation or Removal and Selection of Successor. The resignation or removal of Unit Operator and the selection of a successor shall be governed by the provisions of the Unit Agreement.

ARTICLE 7
AUTHORITIES AND DUTIES OF UNIT OPERATOR

7.1 Exclusive Right to Operate Unit. Subject to the provisions of this agreement and to instructions from Working Interest Owners, Unit Operator shall have the exclusive right and be obligated to conduct Unit Operations.

7.2 Workmanlike Conduct. Unit Operator shall conduct Unit Operations in a good and workmanlike manner as would a prudent operator under the same or similar circumstances. Unit Operator shall freely consult with Working Interest Owners and keep them informed of all matters which Unit Operator, in the exercise of its best judgment, considers important. Unit Operator shall not be liable to Working Interest Owners for damages, unless such damages result from its gross negligence or willful misconduct.

7.3 Liens and Encumbrances. Unit Operator shall endeavor to keep the lands, leases and Unit Equipment in the Unit Area free from all liens and encumbrances occasioned by Unit Operations, except the lien and security interest of Unit Operator granted hereunder.

7.4 Employees. The number of employees used by Unit Operator in conducting Unit Operations, their selection, hours of labor, and compensation shall be determined by Unit Operator. Such employees shall be the employees of Unit Operator.

7.5 Records. Unit Operator shall keep correct books, accounts, and records of Unit Operations.

7.6 Reports to Working Interest Owners. Unit Operator shall furnish to Working Interest Owners quarterly reports of Unit Operations or reports a such less-frequent intervals as may be approved by Working Interest Owners.

7.7 Reports to Governmental Authorities. Unit Operator shall make all reports to governmental authorities that it has the duty to make as Unit Operator.

7.8 Engineering and Geological Information. Unit Operator shall furnish to a Working Interest Owner, upon written request, a copy of all logs and other engineering and geological data pertaining to wells drilled for Unit Operations.

7.9 Expenditures. Unit Operator is authorized to make single expenditures not in excess of twenty-five thousand dollars ($25,000) without prior approval of Working Interest Owners; provided that any capital expenditure in excess of five thousand dollars ($5,000) will be described in an informational authority for expenditure furnished to Working Interest Owners, except individual Working Interest Owners declining to receive such information. If an emergency occurs, Unit Operator may immediately make or incur such expenditures as in its opinion are required to deal with the emergency. Unit Operator shall report to Working Interest Owners, as promptly as possible, the nature of the emergency and the action taken.

7.10 Wells Drilled by Unit Operator. All wells drilled by Unit Operator shall be on a competitive bid basis. Unit Operator may employ its own tools and equipment under terms and conditions approved by Working Interest Owners.

7.11 Border Agreements. Unit Operator may, after approval by Working Interest Owners, enter into border agreements with respect to lands adjacent to the Unit Area for the purpose of coordinating operations.

ARTICLE 8
TAXES

8.1 Ad Valorem Taxes. Beginning with the first calendar year commencing after the Effective Date hereof, Unit Operator shall make and file all necessary ad valorem tax renditions and returns with the proper taxing authorities with respect to all property of each Working Interest Owner used or held by Unit Operator for Unit Operations. Unit Operator shall settle assessments arising therefrom. All such ad valorem taxes shall be paid by Unit Operator and charged to the joint account; however, if the interest of a Working Interest Owner is subject to a separately assessed overriding royalty interest, production payment, or other interest in excess of a one-eighth (1/8) royalty, such Working Interest Owner shall notify Unit Operator of such interest prior to the rendition date and shall be given credit for the reduction in taxes paid resulting therefrom.

8.2 Other Taxes. Each Working Interest Owner shall pay or cause to be paid all production, severance, gathering, and other taxes imposed upon or with respect to the production or handling of its share of Unitized Substances.

ARTICLE 9
INSURANCE

9.1 Insurance. Unit Operator, with respect to Unit Operations, shall:

9.1.1 Comply with the Workmen's Compensation Law of the State of New Mexico.

9.1.2 Provide employers' liability insurance with a limit of $100,000.

9.1.3. Provide other insurance as set forth in Exhibit G.

ARTICLE 10
ADJUSTMENT OF INVESTMENTS

10.1 Personal Property Taken Over. Upon the Effective Date hereof, Working Interest Owners shall deliver to Unit Operator the following:

10.1.1 Wells and Casing. All wells completed in the Unitized Formation, together with all casing therein.

10.1.2 Well and Lease Equipment. The tubing in each such well, the wellhead connections thereon, and all other well, lease and operating equipment used in the operation of such wells which Working Interest Owners determine is necessary or desirable for conducting Unit Operations. Working Interest Owners shall make such determination as soon as practicable after the Effective Date hereof, and all of such property that is determined to be surplus shall be returned as promptly as possible to the Working Interest Owners who delivered same to Unit Operator. Property determined by Working Interest Owners to be surplus shall not be considered to have been taken over under this agreement.

10.1.3 Condition of Wells. All wells, including the casing therein, shall be delivered to Unit Operator in reasonably good physical condition capable of being used for Unit Operations. If within one hundred and eighty (180) days after the Effective Date hereof (a) any such well is determined by the Working Interest Owners not to have been in reasonably good physical condition on said Effective Date, or (b) any casing failure or leak is discovered by Unit Operator in any such well, whether such casing failure or leak developed before or after the Effective Date hereof, the Working Interest Owner who contributed such well shall be liable to the other Working Interest Owners for liquidated damages in an amount, measured by the cost to Working Interest Owners of repairing such well or drilling a replacement well, not to exceed fifty thousand dollars ($50,000), provided that any amount in excess of fifty thousand dollars ($50,000) shall be treated as any other item of Unit Expense and charged to the joint account.

10.1.4 Records. A copy of all production and well records that pertain to such wells.

10.2 Inventory and Evaluation of Personal Property. Working Interest Owners shall at Unit Expense inventory and evaluate the personal property taken over under Section 10.1.2, except flowlines, and shall inventory the

casing taken over under Section 10.1.1, but casing shall be given no value. Such inventories shall include and be limited to those items of equipment indicated to be controllable in the most recent edition of the "Materials Classification Manual" prepared by the Council of Petroleum Accountants Societies of North America, except that, upon determination of Working Interest Owners, items considered noncontrollable may be included in the inventory in order to insure a more equitable adjustment of investment. All noncontrollable items of well and lease equipment installed within the Unit Area that are required in Unit Operations, although excluded from the inventories, shall nevertheless be taken over by the Unit Operator. Immediately following completion of such inventory, the material and equipment taken over under Section 10.1.2 shall be priced at a realistic value as determined by the Working Interest Owners, which pricing shall be performed under the supervision of, by the personnel of, and in the offices of the Unit Operator, with other Working Interest Owners furnishing such additional pricing help as may be available and necessary.

10.3 Investment Adjustment. Upon approval by Working Interest Owners of the inventory and evaluation, investments shall be adjusted as follows:

10.3.1 Initial Adjustment of Investments. Each Working Interest Owner shall be credited with the value, as determined in accordance with Section 10.2 above, of its interest in all personal property taken over by Unit Operator under Section 10.1.2 and charged with an amount equal to that obtained by multiplying the total value of all such personal property taken over by Unit Operator under Section 10.1.2 by such Working Interest Owner's Investment Participation, as shown on Exhibit E. If the charge against any Working Interest Owner is greater than the amount credited to such Working Interest Owner, the resulting net charge shall be paid and in all other respects be treated as any other item of Unit Expense chargeable against such Working Interest Owner. If the credit to any Working Interest Owner is greater than the amount charged against such Working Interest Owner, the resulting net credit shall be paid to such Working Interest Owner by Unit Operator out of funds received by it in settlement of the net charges described above.

10.3.2 Readjustments of Investments. Effective as of the Investment Readjustment Date, the investment account of the Working Interest Owners hereunder shall be readjusted on the basis of their respective Phase III Unit Participations, as shown on Exhibit E. For the purposes of such readjustment, each Working Interest Owner shall be (1) credited for its interest in the adjusted value of all personal property and facilities taken over or otherwise acquired by the Unit Operator pursuant to this agreement prior to the Investment Readjustment Date, and (2) charged with an amount equal to that obtained by multiplying the same adjusted value of personal property and facilities by such Working Interest Owner's Phase III Unit Participation. The adjusted value of all personal property and facilities for the purposes of this Section 10.3.2 shall be determined as follows:

(a) Value personal property and facilities initially taken over by Unit Operator on the same basis as that used when such personal property and facilities were taken over.

(b) Value all other investment items (controllable and noncontrollable materials and construction costs) acquired prior to the Investment Readjustment Date, including well casing subsequently purchased and installed, injection well conversion costs, and tank battery consolidation costs, on the basis of cost to the joint account.

(c) Add (a) and (b) together and deduct the value of all items of investment retired prior to the Investment Readjustment Date on the same basis that such items were originally charged.

Each Working Interest Owner shall be charged or credited with the net cash amount necessary to effect such readjustment of the investment account, and such charges and credits shall be settled in the same manner as the charges and credits referred to in Section 10.3.1.

10.4 General Facilities and Abandoned Installations. The acquisition of warehouses, warehouse stocks, lease houses, camps, facility systems, and office buildings necessary for Unit Operations shall be by negotiation by the owners thereof and Unit Operator, subject to the approval of Working Interest Owners. There shall be no adjustment for lease roads or appurtenances thereto.

10.5 Exchange of Interest in and Ownership of Personal Property and Facilities. Each Working Interest Owner hereby exchanges, and agrees to exchange, its interest in all of the personal property and facilities described in Section 10.1.2 above for its proportionate interest, as shown for Investment Participation on Exhibit E during the time prior to the Investment Readjustment Date and as shown for Phase III Unit Participation on Exhibit E from and after the Investment Readjustment Date in all such personal property and facilities described in Section 10.1.2. Each Working Interest Owner, individually, shall by virtue hereof own an undivided interest in all personal property and facilities taken over or otherwise acquired by Unit Operator pursuant to this agreement.

ARTICLE 11
UNIT EXPENSE

11.1 Basis of Charge to Working Interest Owners. Unit Operator initially shall pay all Unit Expense. Each Working Interest Owner shall reimburse Unit Operator for its share of Unit Expense on the basis provided in Sections 11.1.1 and 11.1.2 below. All charges, credits, and accounting for Unit Expense shall be in accordance with Exhibit F.

11.1.1. Operating Expense. Operating expense shall be shared and borne by Working Interest Owners in proportion to Phase I, Phase II or Phase III Unit Participation, whichever phase is in effect at the time such expense was incurred.

11.1.2. Investment Cost. The cost of investment items (as described in Section 10.3.2 (b) above) incurred prior to the Investment Readjustment Date shall be shared and borne by Working Interest Owners in proportion to Investment Participation. The cost of such investment items incurred after the Investment Readjustment Date shall be shared and borne by Working Interest Owners in proportion to Phase III Unit Participation.

11.2 Budgets. Before or as soon as practical after the Effective Date hereof, Unit Operator shall prepare a budget of estimated Unit Expense for the remainder of the calendar year, and, on or before the first day of each August thereafter, shall prepare such a budget for the ensuing calendar year. A budget shall set forth the estimated Unit Expense by quarterly periods. Budgets shall be estimates only, and shall be adjusted or corrected by Working Interest Owners and Unit Operator whenever an adjustment or correction is proper. A copy of each budget and adjusted budget shall promptly be furnished to each Working Interest Owner.

11.3 Advance Billings. Unit Operator shall have the right, without prejudice to other rights or remedies, to require Working Interest Owners to advance their respective shares of estimated Unit Expense by submitting to Working Interest Owners, on or before the 15th day of any month, an itemized estimate thereof for the succeeding month, with a request for payment in advance. Within fifteen (15) days thereafter, each Working Interest Owner shall pay to Unit Operator its share of such estimate. Adjustments between estimated and actual Unit Expense shall be made by Unit Operator at the close of each calendar month, and the accounts of Working Interest Owners shall be adjusted accordingly.

11.4 Commingling of Funds. Funds received by Unit Operator under this agreement need not be segregated or maintained by it as a separate fund, but may be commingled with its own funds.

11.5 Liens and Security Interest of Unit Operator. Each Working Interest Owner grants to Unit Operator and Unit Operator shall have as to each Working Interest Owner a lien upon its Oil and Gas Rights in each Tract, and a security interest in its share of Unitized Substances when extracted, and its interest in all Unit Equipment, to secure payment of its share of Unit Expense, together with interest thereon at the rate of twelve percent (12%) per annum or the maximum contract rate permitted by applicable usury laws, whichever is the lesser; provided, however, that notwithstanding anything in this agreement to the contrary, said lien shall not be enforceable by foreclosure and sale of the Oil and Gas Rights of any Working Interest Owner which is not a signatory party to this agreement.

To the extent that Unit Operator has a security interest under the Uniform Commercial Code of the State of New Mexico, Unit Operator shall be entitled to exercise the rights and remedies of a secured party under the Code. The bringing of a suit and the obtaining of judgment by Unit Operator for the secured indebtedness shall not be deemed an election of remedies or otherwise affect the lien rights or security interest as security for the payment thereof. In addition, upon default by any Working Interest Owner in the payment of its share of Unit Expense, Unit Operator shall have the right, without prejudice to other rights or remedies, to collect from the purchaser the proceeds from the sale of such Working Interest Owner's share of Unitized Substances until the amount owed by such Working Interest Owner, plus interest as aforesaid, has been paid. Each purchaser shall be entitled to rely upon Unit Operator's written statement concerning the amount of any default. Unit Operator hereby grants to the other Working Interest Owners a similar lien upon all of Unit Operator's right, title and interest as a Working Interest Owner hereunder as security for payment of any and all amounts that may become due and owing hereunder by Unit Operator to any of such other Working Interest Owners.

11.6 Unpaid Unit Expense. If any Working Interest Owner fails to pay its share of Unit Expense within sixty (60) days after rendition of a statement therefor by Unit Operator, each Working Interest Owner which is a signatory party to this agreement shall, upon request by Unit Operator, pay its proportionate part of the unpaid share of Unit Expense of the non-paying Working Interest Owner. Working Interest Owners that pay the share of Unit Expense of a non-paying Working Interest Owner shall be reimbursed by the Unit Operator for the amount so paid, plus any interest collected thereon, upon receipt by Unit Operator of any past due amount collected from or otherwise received for the account of the non-paying Working Interest Owner. Each Working Interest Owner so paying a non-paying Working Interest Owner's share of Unit Expense shall be subrogated to the lien and other rights herein granted Unit Operator, and each such Working Interest Owner, in proportion to the amounts so paid and not reimbursed, shall have and be entitled to exercise the voting interest of the non-paying Working Interest Owner.

11.7 Carved-out Interest. If any Working Interest Owner shall, after becoming bound by this agreement, create an overriding royalty, production payment, net proceeds interest, carried interest, or any other interest out of its Working Interest, such carved-out interest shall be subject to the terms and provisions of this agreement, specifically including, but without limitation, Section 11.5 hereof entitled "Lien and Security Interest of Unit Operator". If the Working Interest Owner creating such carved-out interest (a) fails to pay any Unit Expense chargeable to such Working Interest Owner under this agreement, and the production of Unitized Substances accruing to the credit of such Working Interest Owner is insufficient for that purpose, or (b) withdraws from this agreement under the terms and provisions of Article 17 hereof, the carved-out interest

shall be chargeable with a pro rata portion of all Unit Expense incurred hereunder, the same as though such carved-out interest were a Working Interest, and Unit Operator shall have the right to enforce against such carved-out interest the lien and all other rights granted in Section 11.5 for the purpose of collecting the Unit Expense chargeable to the carved-out interest.

11.8 Uncommitted Royalty. Should an owner of a Royalty Interest in any Tract fail to become a party to the Unit Agreement, and, as a result thereof, the actual Royalty Interest payments with respect to such Tract are more or less than the Royalty Interest payments computed on the basis of the Unitized Substances that are allocated to such Tract under the Unit Agreement, the difference shall be borne by or inure to the benefit of Working Interest Owners, in proportion to their respective Unit Participations at the time the Unitized Substances were produced; however, the difference to be borne by or inure to the benefit of Working Interest Owners shall not exceed an amount computed on the basis of one-eighth (1/8) of the difference between the Unitized Substances allocated to the Tract and the Unitized Substances produced from the Tract. Such adjustments shall be made by charges and credits to the joint account.

11.9 Rentals. The Working Interest Owners in each Tract shall pay and bear all rentals, minimum royalty, advance rentals or delay rentals due under the lease thereon and shall concurrently submit to the Unit Operator evidence of payment.

ARTICLE 12
NONUNITIZED FORMATIONS

12.1 Right to Operate. Any Working Interest Owner that now has or hereafter acquires the right to drill for and produce oil, gas, or other minerals, from a formation underlying the Unit Area other than the Unitized Formation, shall have the right to do so notwithstanding this agreement or the Unit Agreement. In exercising the right, however, the Working Interest Owner shall exercise care to prevent unreasonable interference with Unit Operations. No Working Interest Owner shall produce Unitized Substances through any well drilled or operated by it. If any Working Interest Owner drills any well into or through the Unitized Formation, the Unitized Formation shall be protected in a manner satisfactory to Working Interest Owners so that production of Unitized Substances will not be adversely affected.

12.2 Multiple Completions. No well now or hereafter completed in the Unitized Formation shall ever be completed as a multiple completion with the Unitized Formation and any other formation unless such multiple completion and the subsequent handling of the multiple completion is approved by Working Interest Owners in accordance with the voting procedure set out in Section 4.3.2 of this agreement.

ARTICLE 13
TITLES

13.1 Warranty and Indemnity. Each Working Interest Owner represents and warrants that it is the owner of the respective Working Interests set forth opposite its name in Exhibit B, and agrees to indemnify and hold harmless the other Working Interest Owners from any loss due to failure, in whole or in part, of its title to any such interest, except failure of title arising because of Unit Operations; however, such indemnity and any liability for breach of warranty shall be limited to an amount equal to the net value that has been received from the sale or receipt of Unitized Substances attributed to the interest as to which title failed. Each failure of title will be deemed to be effective, insofar as this agreement is concerned, as of 7:00 a.m. on the first day of the calendar month in which such failure is finally determined, and there shall be no retroactive adjustment of Unit Expense, or retroactive allocation of Unitized Substances or the proceeds therefrom, as a result of a title failure.

13.2 Failure Because of Unit Operations. The failure of title to any Working Interest in any Tract because of Unit Operations, including non-production from such Tract, shall not change the Unit Participation of the Working Interest Owner whose title failed in relation to the Unit Participation of the other Working Interest Owners at the time of the title failure.

ARTICLE 14
LIABILITY, CLAIMS, AND SUITS

14.1 Individual Liability. The duties, obligations, and liabilities of Working Interest Owners shall be several and not joint or collective; and nothing herein contained shall ever be construed as creating a partnership of any kind, joint venture, association, or trust among Working Interest Owners.

14.2 Settlements. Unit Operator may settle any single damage claim or suit involving Unit Operations if the expenditure does not exceed seven thousand five hundred dollars ($7,500.00) and if the payment is in complete settlement of such claim or suit. If the amount required for settlement exceeds the above specified amount, Working Interest Owners shall assume and take over the further handling of the claim or suit unless such authority is expressly delegated to Unit Operator. All costs and expense of handling, settling, or otherwise discharging such claim or suit shall be an item of Unit Expense. If a claim is made against any Working Interest Owner or if any Working Interest Owner is sued on account of any matter arising from Unit Operations over which such Working Interest Owner individually has no control because of the rights given Working Interest Owners and Unit Operator by this agreement and the Unit Agreement, the Working Interest Owner shall immediately notify the Unit Operator, and the claim or suit shall be treated as any other claim or suit involving Unit Operations.

ARTICLE 15
INTERNAL REVENUE PROVISION

15.1 Internal Revenue Provision. Notwithstanding any provisions herein that the rights and liabilities of the parties hereunder are several and not joint or collective, or that this agreement and operations hereunder shall not constitute a partnership, if for Federal income tax purposes this agreement and the operations hereunder are regarded as a partnership, then each of the parties hereto elects to be excluded from the application of all of the provisions of Subchapter K, Chapter 1, Subtitle A, of the Internal Revenue Code of 1954, as permitted and authorized by Section 761 of the Code and the regulations promulgated hereunder. Each party hereto agrees not to give any notices or take any other action inconsistent with the election made hereby. If any present or future income tax laws of the state or states in which the Unit Area is located, or any future income tax law of the United States, contain provisions similar to those in Subchapter K, Chapter 1, Subtitle A, of the Internal Revenue Code of 1954, under which an election similar to that provided by Section 761 of the Code is permitted, each of the parties agree to make such election as may be permitted or required by such laws. In making this election, each of the parties states that the income derived by such party from the operations under this agreement can be adequately determined without the computation of partnership taxable income.

ARTICLE 16
NOTICES

16.1 Notices. All notices required hereunder shall be in writing and shall be deemed to have been properly served when sent by mail or telegram to the address of the representative of each Working Interest Owner as furnished to Unit Operator in accordance with Article 4.

ARTICLE 17
WITHDRAWAL OF WORKING INTEREST OWNER

17.1 Withdrawal. A Working Interest Owner may withdraw from this Agreement by transferring, without warranty of title either express or implied, to the Working Interest Owners who do not desire to withdraw all its Oil and Gas Rights, exclusive of Royalty Interests, together with its interest in all Unit Equipment and in all wells used in Unit Operations, provided that such transfer shall not relieve such Working Interest Owner from any obligation or liability incurred prior to the first day of the month following receipt by Unit Operator of such transfer, and further provided that each of the non-transferring Working Interest Owners shall have the option to acquire a transferred interest and shall indicate such election by notifying the Unit Operator in writing within thirty (30) days of notice of withdrawal. The delivery of the transfer shall be made to Unit Operator for the transferees. The transferred interest shall be owned by the transferees in proportion to their respective Unit Participations. The

transferees, in proportion to the respective interests so acquired, shall pay the transferor for its interest in Unit Equipment, the salvage value thereof less its share of the estimated cost of salvaging same and of plugging and abandoning all wells then being used or held for Unit Operations, as determined by Working Interest Owners. In the event such withdrawing owner's interest in the aforesaid salvage value is less than such owner's share of such estimated costs, the withdrawing owner, as a condition precedent to withdrawal, shall pay the Unit Operator, for the benefit of Working Interest Owners succeeding to its interest, a sum equal to the deficiency. Within sixty (60) days after receiving delivery of the transfer, Unit Operator shall render a final statement to the withdrawing owner for its share of Unit Expense, including any deficiency in salvage value as determined by Working Interest Owners, incurred as of the first day of the month following the date of receipt of the transfer. Provided all Unit Expense, including any deficiency hereunder, due from the withdrawing owner has been paid in full within thirty (30) days after the rendering of such final statement by the Unit Operator, withdrawing owner shall be relieved from all further obligations and liabilities hereunder and under the Unit Agreement, and the rights of the withdrawing Working Interest Owner hereunder and under the Unit Agreement shall cease insofar as they existed by virtue of the interest transferred.

17.2 Limitation on Withdrawal. Notwithstanding anything set forth in Section 17.1, Working Interest Owners may refuse to permit the withdrawal of a Working Interest Owner if its Working Interest is burdened by any royalties, overriding royalties, production payments, net proceeds interest, carried interest, or any other interest created out of the Working Interest in excess of one-eighth (1/8) lessor's royalty, unless other Working Interest Owners willing to accept the assignment agree to accept the Working Interest subject to such burdens.

ARTICLE 18
ABANDONMENT OF WELLS

18.1 Rights of Former Owners. If Working Interest Owners decide to abandon permanently any well within the Unit Area prior to termination of the Unit Agreement, Unit Operator shall give written notice thereof to the Working Interest Owners of the Tract on which the well is located, and they shall have the option for a period of ninety (90) days after the sending of such notice to notify Unit Operator in writing of their election to take over and own the well. Within thirty (30) days after the Working Interest Owners of the Tract have notified Unit Operator of their election to take over the well, they shall pay Unit Operator, for credit to the joint account, the amount estimated by Working Interest Owners to be the net salvage value, as determined by Working Interest Owners, of the casing and equipment in and on the well up to and including the wellhead equipment, except the casing therein if contributed by such Working Interest Owners under Section 10.1.1. The Working Interest Owners of the Tract, by taking

over the well, agree to seal off effectively and protect the Unitized Formation, and upon abandonment to plug the well in compliance with applicable laws and regulations.

18.2 Plugging. If the Working Interest Owners of a Tract do not elect to take over a well located within the Unit Area that is proposed for abandonment, Unit Operator shall at Unit Expense plug and abandon the well in compliance with applicable laws and regulations.

ARTICLE 19
EFFECTIVE DATE AND TERM

19.1 Effective Date. This agreement shall become effective when the Unit Agreement becomes effective.

19.2 Term. This agreement shall continue in effect so long as the Unit Agreement remains in effect, and thereafter until (a) all unit wells have been plugged and abandoned or turned over to Working Interest Owners in accordance with Article 20, (b) all Unit Equipment and real property acquired for the joint account have been disposed of by Unit Operator in accordance with instructions of Working Interest Owners, and (c) there has been a final accounting.

ARTICLE 20
ABANDONMENT OF OPERATIONS

20.1 Termination. Upon termination of the Unit Agreement, the following will occur:

20.1.1 Oil and Gas Rights. Oil and Gas Rights in and to each separate Tract shall no longer be affected by this agreement, and thereafter the parties shall be governed by the terms and provisions of the leases, contracts, and other instruments affecting the separate Tracts.

20.1.2 Right to Operate. Working Interest Owners of any Tract that desire to take over and continue to operate wells located thereon may do so by paying Unit Operator, for credit to the joint account, the amount estimated by Working Interest Owners to be the net salvage value, as determined by Working Interest Owners, of the casing and equipment up to and including the wellhead equipment in and on the wells taken over, except the casing therein if contributed by such Working Interest Owners under Section 10.1.1, and by agreeing to plug properly each well at such time as it is abandoned.

20.1.3 Salvaging Wells: Unit Operator shall salvage as much of the casing and equipment in or on wells not taken over by Working

Interest Owners of separate Tracts as can economically and reasonably be salvaged, and shall cause the wells to be plugged and abandoned in compliance with applicable laws and regulations.

20.1.4 Cost of Abandonment. The cost of abandonment of Unit Operations shall be Unit Expense.

20.1.5 Distribution of Assets. Working Interest Owners shall share in the distribution of Unit Equipment, or the proceeds thereof, in the same proportion as then applicable to the sharing of investment costs.

ARTICLE 21
EXECUTION

21.1 Original, Counterpart, or Other Instrument. An owner of a Working Interest may become a party to this agreement by signing the original of this instrument, a counterpart thereof, or other instrument agreeing to be bound by the provisions hereof. The signing of any such instrument shall have the same effect as if all the parties had signed the same instrument.

ARTICLE 22
SUCCESSORS AND ASSIGNS

22.1 Successors and Assigns. This agreement shall extend to, be binding upon, and inure to the benefit of the parties hereto and their respective heirs, devisees, legal representatives, successors, and assigns, and shall constitute a covenant running with the lands, leases, and interests covered hereby.

IN WITNESS WHEREOF, the parties hereto have executed this agreement on the dates opposite their respective signatures.

SHELL OIL COMPANY
Unit Operator and Working Interest Owner

Date: July 31, 1978

By: Robert L. Avary
Attorney in Fact
ROBERT L. AVARY
P. O. Box 991
Houston, Texas 77001

STATE OF TEXAS)
)
COUNTY OF HARRIS)

The foregoing instrument was acknowledged before me this 31st day of July, 1978, by ROBERT L. AVARY, Attorney in Fact for SHELL OIL COMPANY, a Delaware corporation, on behalf of said corporation.

My Commission expires:

BELINDA ROEBER
Notary Public in and for Harris County, Texas
My Commission Expires July 21, 1979

Belinda Roeber
Notary Public in and for
Harris County, Texas

North Hobbs (Grayburg-San Andres) Unit
Lea County, New Mexico

ACCOUNTING PROCEDURE
JOINT OPERATIONS

I. GENERAL PROVISIONS

1. Definitions

"Joint Property" shall mean the real and personal property subject to the agreement to which this Accounting Procedure is attached.

"Joint Operations" shall mean all operations necessary or proper for the development, operation, protection and maintenance of the Joint Property.

"Joint Account" shall mean the account showing the charges paid and credits received in the conduct of the Joint Operations and which are to be shared by the Parties.

"Operator" shall mean the party designated to conduct the Joint Operations.

"Non-Operators" shall mean the parties to this agreement other than the Operator.

"Parties" shall mean Operator and Non-Operators.

"First Level Supervisors" shall mean those employees whose primary function in Joint Operations is the direct supervision of other employees and/or contract labor directly employed on the Joint Property in a field operating capacity.

"Technical Employees" shall mean those employees having special and specific engineering, geological or other professional skills, and whose primary function in Joint Operations is the handling of specific operating conditions and problems for the benefit of the Joint Property.

"Personal Expenses" shall mean travel and other reasonable reimbursable expenses of Operator's employees.

"Material" shall mean personal property, equipment or supplies acquired or held for use on the Joint Property.

"Controllable Material" shall mean Material which at the time is so classified in the Material Classification Manual as most recently recommended by the Council of Petroleum Accountants Societies of North America.

2. Statement and Billings

Operator shall bill Non-Operators on or before the last day of each month for their proportionate share of the Joint Account for the preceding month. Such bills will be accompanied by statements which identify the authority for expenditure, lease or facility, and all charges and credits, summarized by appropriate classifications of investment and expense except that items of Controllable Material and unusual charges and credits shall be separately identified and fully described in detail.

3. Advances and Payments by Non-Operators

Unless otherwise provided for in the agreement, the Operator may require the Non-Operators to advance their share of estimated cash outlay for the succeeding month's operation. Operator shall adjust each monthly billing to reflect advances received from the Non-Operators.

Each Non-Operator shall pay its proportion of all bills within fifteen (15) days after receipt. If payment is not made within such time, the unpaid balance shall bear interest monthly at the rate of twelve percent (12%) per annum or the maximum contract rate permitted by the applicable usury laws in the state in which the Joint Property is located, whichever is the lesser, plus attorney's fees, court costs, and other costs in connection with the collection of unpaid amounts.

4. Adjustments

Payment of any such bills shall not prejudice the right of any Non-Operator to protest or question the correctness thereof; provided, however, all bills and statements rendered to Non-Operators by Operator during any calendar year shall conclusively be presumed to be true and correct after twenty-four (24) months following the end of any such calendar year, unless within the said twenty-four (24) month period a Non-Operator takes written exception thereto and makes claim on Operator for adjustment. No adjustment favorable to Operator shall be made unless it is made within the same prescribed period. The provisions of this paragraph shall not prevent adjustments resulting from a physical inventory of Controllable Material as provided for in Section V.

5. Audits

A Non-Operator, upon notice in writing to Operator and all other Non-Operators, shall have the right to audit Operator's accounts and records relating to the Joint Account for any calendar year within the twenty-four (24) month period following the end of such calendar year; provided, however, the making of an audit shall not extend the time for the taking of written exception to and the adjustments of accounts as provided for in Paragraph 4 of this Section I. Where there are two or more Non-Operators, the Non-Operators shall make every reasonable effort to conduct joint or simultaneous audits in a manner which will result in a minimum of inconvenience to the Operator. Operator shall bear no portion of the Non-Operators' audit cost incurred under this paragraph unless agreed to by the Operator.

6. Approval by Non-Operators

Where an approval or other agreement of the Parties or Non-Operators is expressly required under other sections of this Accounting Procedure and if the agreement to which this Accounting Procedure is attached contains no contrary provisions in regard thereto, Operator shall notify all Non-Operators of the Operator's proposal, and the agreement or approval of a majority in interest of the Non-Operators shall be controlling on all Non-Operators.

II. DIRECT CHARGES

Operator shall charge the Joint Account with the following items:

1. **Rentals and Royalties**

   Lease rentals and royalties paid by Operator for the Joint Operations.

2. **Labor**

   A. (1) Salaries and wages of Operator's field employees directly employed on the Joint Property in the conduct of Joint Operations and related expenses.

   (2) Salaries of First Level Supervisors in the field.

   (3) Salaries and wages of Technical Employees directly employed on the Joint Property if such charges are excluded from the Overhead rates.

   B. Operator's cost of holiday, vacation, sickness and disability benefits and other customary allowances paid to employees whose salaries and wages are chargeable to the Joint Account under Paragraph 2A of this Section II. Such costs under this Paragraph 2B may be charged on a "when and as paid basis" or by "percentage assessment" on the amount of salaries and wages chargeable to the Joint Account under Paragraph 2A of this Section II. If percentage assessment is used, the rate shall be based on the Operator's cost experience.

   C. Expenditures or contributions made pursuant to assessments imposed by governmental authority which are applicable to Operator's costs chargeable to the Joint Account under Paragraphs 2A and 2B of this Section II.

   D. Personal Expenses of those employees whose salaries and wages are chargeable to the Joint Account under Paragraph 2A of this Section II.

3. **Employee Benefits**

   Operator's current costs of established plans for employees' group life insurance, hospitalization, pension, retirement, stock purchase, thrift, bonus, and other benefit plans of a like nature, applicable to Operator's labor cost chargeable to the Joint Account under Paragraphs 2A and 2B of this Section II shall be Operator's actual cost not to exceed twenty per cent (20%), or percent most recently recommended by the Council of Petroleum Accountants Societies of North America.

4. **Material**

   Material purchased or furnished by Operator for use on the Joint Property as provided under Section IV. Only such Material shall be purchased for or transferred to the Joint Property as may be required for immediate use and is reasonably practical and consistent with efficient and economical operations. The accumulation of surplus stocks shall be avoided.

5. **Transportation**

   Transportation of employees and Material necessary for the Joint Operations but subject to the following limitations:

   A. If Material is moved to the Joint Property from the Operator's warehouse or other properties, no charge shall be made to the Joint Account for a distance greater than the distance from the nearest reliable supply store, recognized barge terminal, or railway receiving point where like material is normally available, unless agreed to by the Parties.

   B. If surplus Material is moved to Operator's warehouse or other storage point, no charge shall be made to the Joint Account for a distance greater than the distance to the nearest reliable supply store, recognized barge terminal, or railway receiving point unless agreed to by the Parties. No charge shall be made to the Joint Account for moving Material to other properties belonging to Operator, unless agreed to by the Parties.

   C. In the application of Subparagraphs A and B above, there shall be no equalization of actual gross trucking cost of $200 or less excluding accessorial charges.

6. **Services**

   The cost of contract services, equipment and utilities provided by outside sources, except services excluded by Paragraph 9 of Section II and Paragraph 1. ii of Section III. The cost of professional consultant services and contract services of technical personnel directly engaged on the Joint Property if such charges are excluded from the Overhead rates. The cost of professional consultant services or contract services of technical personnel not directly engaged on the Joint Property shall not be charged to the Joint Account unless previously agreed to by the Parties.

7. **Equipment and Facilities Furnished by Operator**

   A. Operator shall charge the Joint Account for use of Operator owned equipment and facilities at rates commensurate with costs of ownership and operation. Such rates shall include costs of maintenance, repairs, other operating expense, insurance, taxes, depreciation, and interest on investment not to exceed eight per cent (8%) per annum. Such rates shall not exceed average commercial rates currently prevailing in the immediate area of the Joint Property.

   B. In lieu of charges in Paragraph 7A above, Operator may elect to use average commercial rates prevailing in the immediate area of the Joint Property less 20%. For automotive equipment, Operator may elect to use rates published by the Petroleum *Motor Transport* Association.

8. **Damages and Losses to Joint Property**

   All costs or expenses necessary for the repair or replacement of Joint Property made necessary because of damages or losses incurred by fire, flood, storm, theft, accident, or other cause, except those resulting from Operator's gross negligence or *willful* misconduct. Operator shall furnish Non-Operator written notice of damages or losses incurred as soon as practicable after a report thereof has been received by Operator.

9. **Legal Expense**

   Expense of handling, investigating and settling litigation or claims, discharging of liens, payment of judgments and amounts paid for settlement of claims incurred in or resulting from operations under the agreement or necessary to protect or recover the Joint Property, except that no charge for services of Operator's legal staff or fees or expense of outside attorneys shall be made unless previously agreed to by the Parties. All other legal expense is considered to be covered by the overhead provisions of Section III unless otherwise agreed to by the Parties, except as provided in Section I. Paragraph 3.

10. Taxes

All taxes of every kind and nature assessed or levied upon or in connection with the Joint Property, the operation thereof, or the production therefrom, and which taxes have been paid by the Operator for the benefit of the Parties.

11. Insurance

Net premiums paid for insurance required to be carried for the Joint Operations for the protection of the Parties. In the event Joint Operations are conducted in a state in which Operator may act as self-insurer for Workman's Compensation and/or Employers Liability under the respective state's laws, Operator may, at its election, include the risk under its self-insurance program and in that event, Operator shall include a charge at Operator's cost not to exceed manual rates.

12. Other Expenditures

Any other expenditure not covered or dealt with in the foregoing provisions of this Section II, or in Section III, and which is incurred by the Operator in the necessary and proper conduct of the Joint Operations.

III. OVERHEAD

1. Overhead - Drilling and Producing Operations

i. As compensation for administrative, supervision, office services and warehousing costs, Operator shall charge drilling and producing operations on either:

(X) Fixed Rate Basis, Paragraph 1A, or
( ) Percentage Basis, Paragraph 1B.

Unless otherwise agreed to by the Parties, such charge shall be in lieu of costs and expenses of all offices and salaries or wages plus applicable burdens and expenses of all personnel, except those directly chargeable under Paragraph 2A, Section II. The cost and expense of services from outside sources in connection with matters of taxation, traffic, accounting or matters before or involving governmental agencies shall be considered as included in the Overhead rates provided for in the above selected Paragraph of this Section III unless such cost and expense are agreed to by the Parties as a direct charge to the Joint Account.

ii. The salaries, wages and Personal Expenses of Technical Employees and/or the cost of professional consultant services and contract services of technical personnel directly employed on the Joint Property shall (X) shall not ( ) be covered by the Overhead rates.

A. Overhead - Fixed Rate Basis

(1) Operator shall charge the Joint Account at the following rates per well per month:

Drilling Well Rate $ 2311
Producing Well Rate $ 165

(2) Application of Overhead - Fixed Rate Basis shall be as follows:

(a) Drilling Well Rate

[1] Charges for onshore drilling wells shall begin on the date the well is spudded and terminate on the date the drilling or completion rig is released, whichever is later, except that no charge shall be made during suspension of drilling operations for fifteen (15) or more consecutive days.

[2] Charges for offshore drilling wells shall begin on the date when drilling or completion equipment arrives on location and terminate on the date the drilling or completion equipment moves off location or rig is released, whichever occurs first, except that no charge shall be made during suspension of drilling operations for fifteen (15) or more consecutive days

[3] Charges for wells undergoing any type of workover or recompletion for a period of five (5) consecutive days or more shall be made at the drilling well rate. Such charges shall be applied for the period from date workover operations, with rig, commence through date of rig release, except that no charge shall be made during suspension of operations for fifteen (15) or more consecutive days.

(b) Producing Well Rates

[1] An active well either produced or injected into for any portion of the month shall be considered as a one-well charge for the entire month.

[2] Each active completion in a multi-completed well in which production is not commingled down hole shall be considered as a one-well charge providing each completion is considered a separate well by the governing regulatory authority.

[3] An inactive gas well shut in because of overproduction or failure of purchaser to take the production shall be considered as a one-well charge providing the gas well is directly connected to a permanent sales outlet.

[4] A one-well charge may be made for the month in which plugging and abandonment operations are completed on any well.

[5] All other inactive wells (including but not limited to inactive wells covered by unit allowable, lease allowable, transferred allowable, etc.) shall not qualify for an overhead charge.

(3) The well rates shall be adjusted as of the first day of April* ~~each year following the effective date of the agreement to which this Accounting Procedure is attached~~. The adjustment shall be computed by multiplying the rate currently in use by the percentage increase or decrease in the average weekly earnings of Crude Petroleum and Gas Production Workers for the last calendar year compared to the calendar year preceding as shown by the index of average weekly earnings of Crude Petroleum and Gas Fields Production Workers as published by the United States Department of Labor, Bureau of Labor Statistics, or the equivalent Canadian index as published by Statistics Canada, as applicable. The adjusted rates shall be the rates currently in use, plus or minus the computed adjustment.

* of the year 1978 and each year thereafter.

B. Overhead - Percentage Basis

(1) Operator shall charge the Joint Account at the following rates:

(a) Development

_____ Percent (__ %) of the cost of Development of the Joint Property exclusive of costs provided under Paragraph 9 of Section II and all salvage credits.

(b) Operating

_____ Percent (__ %) of the cost of Operating the Joint Property exclusive of costs provided under Paragraphs 1 and 9 of Section II, all salvage credits, the value of injected substances purchased for secondary recovery and all taxes and assessments which are levied, assessed and paid upon the mineral interest in and to the Joint Property.

(2) Application of Overhead - Percentage Basis shall be as follows:
For the purpose of determining charges on a percentage basis under Paragraph 1B of this Section III, development shall include all costs in connection with drilling, redrilling, deepening or any remedial operations on any or all wells involving the use of drilling crew and equipment; also, preliminary expenditures necessary in preparation for drilling and expenditures incurred in abandoning when the well is not completed as a producer, and original cost of construction or installation of fixed assets, the expansion of fixed assets and any other project clearly discernible as a fixed asset, except Major Construction as defined in Paragraph 2 of this Section III. All other costs shall be considered as Operating.

2. Overhead - Major Construction

To compensate Operator for overhead costs incurred in the construction and installation of fixed assets, the expansion of fixed assets, and any other project clearly discernible as a fixed asset required for the development and operation of the Joint Property, Operator shall either negotiate a rate prior to the beginning of construction, or shall charge the Joint Account for Overhead based on the following rates for any Major Construction project in excess of $ 25,000 :

A. 3 % of total costs if such costs are more than $ 25,000 but less than $ 100,000 ; plus

B. 3 % of total costs in excess of $ 100,000 but less than $1,000,000; plus

C. 2 % of total costs in excess of $1,000,000.

Total cost shall mean the gross cost of any one project. For the purpose of this paragraph, the component parts of a single project shall not be treated separately and the cost of drilling and workover wells shall be excluded.

3. Amendment of Rates

The Overhead rates provided for in this Section III may be amended from time to time only by mutual agreement between the Parties hereto if, in practice, the rates are found to be insufficient or excessive.

IV. PRICING OF JOINT ACCOUNT MATERIAL PURCHASES, TRANSFERS AND DISPOSITIONS

Operator is responsible for Joint Account Material and shall make proper and timely charges and credits for all material movements affecting the Joint Property. Operator shall provide all Material for use on the Joint Property; however, at Operator's option, such Material may be supplied by the Non-Operator. Operator shall make timely disposition of idle and/or surplus Material, such disposal being made either through sale to Operator or Non-Operator, division in kind, or sale to outsiders. Operator may purchase, but shall be under no obligation to purchase, interest of Non-Operators in surplus condition A or B Material. The disposal of surplus Controllable Material not purchased by the Operator shall be agreed to by the Parties.

1. Purchases

Material purchased shall be charged at the price paid by Operator after deduction of all discounts received. In case of Material found to be defective or returned to vendor for any other reason, credit shall be passed to the Joint Account when adjustment has been received by the Operator.

2. Transfers and Dispositions

Material furnished to the Joint Property and Material transferred from the Joint Property or disposed of by the Operator, unless otherwise agreed to by the Parties, shall be priced on the following basis exclusive of cash discounts:

A. New Material (Condition A)

(1) Tubular goods, except line pipe, shall be priced at the current new price in effect on date of movement on a maximum carload or barge load weight basis, regardless of quantity transferred, equalized to the lowest published price f.o.b. railway receiving point or recognized barge terminal nearest the Joint Property where such Material is normally available.

(2) Line Pipe

(a) Movement of less than 30,000 pounds shall be priced at the current new price, in effect at date of movement, as listed by a reliable supply store nearest the Joint Property where such Material is normally available.

(b) Movement of 30,000 pounds or more shall be priced under provisions of tubular goods pricing in Paragraph 2A (1) of this Section IV.

(3) Other Material shall be priced at the current new price, in effect at date of movement, as listed by a reliable supply store or f.o.b. railway receiving point nearest the Joint Property where such Material is normally available.

B. Good Used Material (Condition B)

Material in sound and serviceable condition and suitable for reuse without reconditioning:

(1) Material moved to the Joint Property

(a) At seventy-five percent (75%) of current new price, as determined by Paragraph 2A of this Section IV.

(2) Material moved from the Joint Property

(a) At seventy-five percent (75%) of current new price, as determined by Paragraph 2A of this Section IV, if Material was originally charged to the Joint Account as new Material, or

(b) at sixty-five percent (65%) of current new price, as determined by Paragraph 2A of this Section IV, if Material was originally charged to the Joint Account as good used Material at seventy-five percent (75%) of current new price.

The cost of reconditioning, if any, shall be absorbed by the transferring property.

C. Other Used Material (Condition C and D)

(1) Condition C

Material which is not in sound and serviceable condition and not suitable for its original function until after reconditioning shall be priced at fifty percent (50%) of current new price as determined by Paragraph 2A of this Section IV. The cost of reconditioning shall be charged to the receiving property, provided Condition C value plus cost of reconditioning does not exceed Condition B value.

(2) Condition D

All other Material, including junk, shall be priced at a value commensurate with its use or at prevailing prices. Material no longer suitable for its original purpose but usable for some other purpose, shall be priced on a basis comparable with that of items normally used for such other purposes. Operator may dispose of Condition D Material under procedures normally utilized by the Operator without prior approval of Non-Operators.

D. Obsolete Material

Material which is serviceable and usable for its original function but condition and/or value of such Material is not equivalent to that which would justify a price as provided above may be specially priced as agreed to by the Parties. Such price should result in the Joint Account being charged with the value of the service rendered by such Material.

E. Pricing Conditions

(1) Loading and unloading costs may be charged to the Joint Account at the rate of fifteen cents (15¢) per hundred weight on all tubular goods movements, in lieu of loading and unloading costs sustained, when actual hauling cost of such tubular goods are equalized under provisions of Paragraph 3 of Section II.

(2) Material involving erection costs shall be charged at applicable percentage of the current knocked-down price of new Material.

3. Premium Prices

Whenever Material is not readily obtainable at published or listed prices because of national emergencies, strikes or other unusual causes over which the Operator has no control, the Operator may charge the Joint Account for the required Material at the Operator's actual cost incurred in providing such Material, in making it suitable for use, and in moving it to the Joint Property; provided notice in writing is furnished to Non-Operators of the proposed charge prior to billing Non-Operators for such Material. Each Non-Operator shall have the right, by so electing and notifying Operator within ten days after receiving notice from Operator, to furnish in kind all or part of his share of such Material suitable for use and acceptable to Operator.

4. Warranty of Material Furnished by Operator

Operator does not warrant the Material furnished. In case of defective Material, credit shall not be passed to the Joint Account until adjustment has been received by Operator from the manufacturers or their agents.

V. INVENTORIES

The Operator shall maintain detailed records of Controllable Material.

1. Periodic Inventories, Notice and Representation

At reasonable intervals, Inventories shall be taken by Operator of the Joint Account Controllable Material. Written notice of intention to take inventory shall be given by Operator at least thirty (30) days before any inventory is to begin so that Non-Operators may be represented when any inventory is taken. Failure of Non-Operators to be represented at an inventory shall bind Non-Operators to accept the inventory taken by Operator.

2. Reconciliation and Adjustment of Inventories

Reconciliation of a physical inventory with the Joint Account shall be made, and a list of overages and shortages shall be furnished to the Non-Operators within six months following the taking of the inventory. Inventory adjustments shall be made by Operator with the Joint Account for overages and shortages, but Operator shall be held accountable only for shortages due to lack of reasonable diligence.

3. Special Inventories

Special Inventories may be taken whenever there is any sale or change of interest in the Joint Property. It shall be the duty of the party selling to notify all other Parties as quickly as possible after the transfer of interest takes place. In such cases, both the seller and the purchaser shall be governed by such inventory.

4. Expense of Conducting Periodic Inventories

The expense of conducting periodic Inventories shall not be charged to the Joint Account unless agreed to by the Parties.

EXHIBIT G
ATTACHED TO UNIT OPERATING AGREEMENT
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT
LEA COUNTY, NEW MEXICO

INSURANCE PROVISIONS

Unit Operator shall carry the following insurance with respect to Unit Operations:

(1) Public liability and property damage insurance with limits of $100,000.00 for injuries to or death of one person and $300,000.00 for injuries or deaths in one accident, and $100,000.00 for property damage in one accident.

(2) Automobile public liability and property damage insurance with limits of $100,000.00 for injuries to or death of one person and $300,000.00 for injuries or deaths in one accident, and $100,000.00 for property damage in one accident.

All insurance coverage required hereby shall be carried at the joint expense and for the benefit of the Working Interest Owners. Premiums for automobile public liability and property damage insurance on Unit Operator's fully owned equipment shall not be charged directly to the joint account, but will be covered by the flat rate charge assessed for the use of such equipment. Unit Operator will not carry fire, windstorm or explosion insurance covering Unit Operations or Unit Equipment.

Contractors and sub-contractors will be required to carry insurance of the same types as hereinabove specified and in such amounts as deemed necessary by Unit Operator.

If under the laws of the State in which operations are conducted Operator is authorized to be a self-insurer as to workmen's compensation and/or employers' liability, Operator may elect to be a self-insurer under such laws and in such event Operator shall charge to the joint account, in lieu of any premiums for such insurance, a premium equivalent limited to amounts determined by applying manual insurance rates to the payroll.

If the parties hereto or any of them shall insure their respective risks beyond the specific limits of insurance required hereunder to be carried by the Unit Operator, the benefits of such insurance shall inure to the parties procuring and maintaining the same, respectively, and the cost of such insurance shall be borne by such parties, respectively, without reimbursement one from the other and without entering into any accounting hereunder.

EXHIBIT H

ATTACHED TO UNIT OPERATING AGREEMENT
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT
LEA COUNTY, NEW MEXICO

INDEMNITY AGREEMENT

WHEREAS, Section 14(c) of an agreement entitled "Unit Agreement, North Hobbs (Grayburg-San Andres) Unit, Lea County, New Mexico," dated July 1, 1978, provides that under certain circumstances and conditions therein stated a Tract that fails to qualify under Section 14(a) or Section 14(b) may be qualified under said Section 14(c) if the requisite Working Interest Owners in the Tract as specified in said Section 14(c) request the qualification of the Tract and execute and deliver, or obligate themselves to execute and deliver, an indemnity agreement; and

WHEREAS, Tract _____, described in the Unit Agreement is such a Tract; and

WHEREAS, the undersigned are owners of Working Interest in such Tract and have become parties to the Unit Agreement and the Unit Operating Agreement and desire the qualification of the Tract under said Section 14(c):

NOW THEREFORE, in consideration of and conditioned upon said Tract meeting the other requirements of said Section 14(c) of the Unit Agreement and its being qualified under said Section 14(c), the undersigned hereby request the qualification of said Tract under said Section 14(c) and agree, together with other owners of Working Interest in the Tract who execute and deliver, or who obligate themselves to execute and deliver, like indemnity agreements, to indemnify and hold harmless all other Working Interest Owners in the Unit Area against all claims and demands required by said Section 14(c) to be the subject of such indemnity. Any liability arising hereunder shall be borne by the undersigned and other Working Interest Owners in the Tract who are committed to like indemnity agreements in the proportion that the Working Interest of each in the Tract bears to the total Working Interest therein of all the owners of Working Interest in the Tract committed to such indemnity agreement.

This indemnity shall become void with respect to all claims and demands based upon occurrences subsequent to any time that conditions are such that said Tract would be qualified under the provisions of said Unit Agreement without this indemnity.

This agreement shall be binding upon and inure to the benefit of the heirs, devisees, legal representatives, successors, and assigns of the respective parties initially bound or benefited by the provisions hereof.

IN WITNESS WHEREOF, each of the undersigned has executed this instrument on the date opposite its signature.

MINUTES OF ENGINEERING SUBCOMMITTEE MEETING
NORTH HOBBS UNIT PROPOSED
AUGUST 29, 1973

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Midland, Texas, on August 29, 1973. The attendance list is attached.

The meeting was called to order at 8:15 a.m. by Mr. Martin A. Thieme, representing Shell Oil Company. Mr. Thieme noted that the meeting would be of an organizational and planning nature. It was the unanimous opinion of those present that secondary oil potential exists in the proposed North Hobbs Unit and that the subcommittee would proceed to fulfill the charges given by the Working Interest Owners in their July 31, 1973, meeting.

Mr. Thieme noted that AMOCO has sent the subcommittee most of the data pertaining to the North Area. The individual well logs will be forthcoming.

Mr. S. B. Pontious, discussed differences in log Øh between his findings and those presented in the March 1972 field-wide study. With no objections, the subcommittee directed Shell as expediter to review all the geological x-sections received from AMOCO and report the results at the next meeting. Shell was further directed to re-evaluate the existing logs with special emphasis on recent logs and report their findings.

The subcommittee will meet in approximately six weeks to determine if more log data are required and, if necessary, recommend a key logging program to the Working Interest Owners.

Mr. W. R. Greene discussed the results of several workovers involving Zone I of the San Andres. He demonstrated that higher water cuts were found in Zone I than depicted in the field-wide study and that the Shell State B-1 (Section 33) tested 100% water.

All companies were requested to send the following information to the chairman of the Engineering Subcommittee at their earliest convenience:

1. Logs run since January 1, 1971, and not previously sent to AMOCO

2. Information on current perforated intervals not previously sent to AMOCO

There being no further business, the meeting was adjourned at 11:30 a.m.

MINUTES OF ENGINEERING SUBCOMMITTEE MEETING
NORTH HOBBS UNIT PROPOSED
NOVEMBER 26, 1973

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Midland, Texas on November 26, 1973. The attendance list is attached.

The meeting was called to order at 10:00 A.M. by Mr. Martin A. Thieme, representing Shell Oil Company. Mr. Thieme noted that the purpose of the meeting was to discuss the method and results of the petrophysical study and the geological study as completed to date, to determine if more log data were required and, if necessary, recommend a key logging program to the Working Interest Owners.

Mr. S. B. Pontious presented a summary of the petrophysical study as detailed in the attachment to the November 15, 1973 letter to the engineering subcommittee. Mr. Pontious discussed the plats of each zone which showed both the geographical areas where better quality logs gave good petrophysical control and the hashered areas where the existing poorer quality logs might require additional log data. It was moved by Shell and seconded by Skelly that the subcommittee accept the petrophysical study and preliminary results as presented. The motion was passed with the voting recorded as follows:

Vote	Companies
Yes	Chevron, Cities Service, Continental, Getty, Samedan, Shell, Skelly, Sun and Texaco
Pass	Amerada, Exxon and TPOC

Mr. F. E. Coupal presented a summary of the geological study as completed to date. East-West cross-sections have been constructed through every well to show the structural and stratigraphic distribution of the major porous beds. Mr. Coupal reported that it is evident from detailed correlation that each zone in the San Andres has one or more relatively high porosity beds that may behave as "thief" zones to water injection. Zone III seems to have the lowest range in permeability and also has a more effective upper seal (sandy break) from the more permeable upper zones. It may be difficult to isolate Zone II from the highly permeable interval at the base of Zone I. In addition, Zone I appears to have other individual porous beds that overlie and are poorly connected with the water drive interval. It appears in Section 31, at least, that the low water-cut production from Zone I in some of these wells may be from one of these "isolated" beds. Mr. Coupal further reported that the Grayburg sand units can be correlated over most of the field with not more than three or four of the sands appearing to have sufficiently continuous permeability to be floodable. However, adequate data is lacking to quantitatively determine lateral continuity, or even satisfactory net pay values. A review of the Grayburg core analyses from seventeen wells in the North area indicated with reasonable certainty that for a minimum permeability of 0.2 md., a cut-off porosity of not less

than 11 percent should be used for the sands. This would require a reduction of approximately one half of the Grayburg "net pay" values as reported by the previous engineering subcommittee for the field wide study.

After much discussion, the subcommittee determined that there were three alternatives for establishing ϕh in the hashered areas of poor petrophysical control.

Alternative No. 1: Recommend a key logging program to the Working Interest Owners which would involve approximately twelve to fifteen wells.

Alternative No. 2: By utilizing the existing logs establish "net h" values in the areas of poor petrophysical control and extrapolate average porosity from offsetting areas of good petrophysical control to determine ϕh in areas of poor control.

Alternative No. 3: Determine the ratios of the ϕh values in the areas of good control to the ϕh values reported by the previous engineering subcommittee for the field wide study in the same areas. Apply these ratios to the ϕh values in the areas of poor control reported by the previous engineering subcommittee.

It was moved by Shell and seconded by Samedan that the subcommittee attempt to determine the ϕh values in the hashered areas of poor log control by a method other than a key logging program at this time. The motion passed with all companies present voting YES.

The subcommittee instructed Shell to determine the ϕh values under Alternatives Nos. 2 and 3 and report the results at the next subcommittee meeting to be held in February. There being no further business, the meeting was adjourned at 2:00 P.M.

MINUTES OF ENGINEERING SUBCOMMITTEE MEETING
NORTH HOBBS UNIT PROPOSED
APRIL 10-11, 197-

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Midland, Texas on April 10-11, 1974. The attendance list is attached.

The meeting was called to order at 9:30 a.m. by Mr. Martin A. Thieme, representing Shell Oil Company. Mr. Thieme noted that the purpose of the meeting was to discuss in detail the results of the geological and petrophysical re-evaluations, to construct Øh maps by zone, to construct water-cut maps by zone, and to construct a zonal completion status map.

Mr. F. E. Coupal discussed the completed geological study in detail; a summary of which was mailed to each member of the subcommittee on March 7, 1974.

The meeting was then turned over to Mr. S. B. Pontious for a discussion of the log analyses. A poll was taken which showed that only 5 of the 13 companies present were prepared to discuss and validate the log analyses on their leases. The chairman reminded the subcommittee that they were requested to be prepared to discuss in detail those items enclosed in the letter dated March 7, 1974 calling this meeting. The chairman then asked the subcommittee what more he or Shell could do to assist them in being prepared for future subcommittee meetings. The consensus of opinion was that Shell could not have done more to assist the members and that the problem was with individual company manpower allocations, etc. It was noted that the 5 companies that had reviewed the log analysis were in agreement with the resulting Øh calculations on their wells. Each company present was given a copy of the log analysis detail on their wells. The subcommittee decided unanimously that each company would check and validate their Øh values by zone by Friday, April 19, 1974, using the method approved by the subcommittee.

A discussion arose concerning the method of contouring the Øh maps. Three companies favored computerized contouring (Getty, TPOC and Skelly) while the other companies favored hand contouring. Skelly volunteered their services for computer contouring. The subcommittee then directed Skelly and/or Shell to contour the Øh maps by computer with payment of any expenses having to be authorized by the Working Interest Owners and that Shell should proceed to refine the existing preliminary Øh maps by hand using the work done by the subcommittee in the meeting. The results will be presented and finalized by the subcommittee at the next meeting which could then be changed only by new log data. Several companies indicated that new logs were forthcoming.

The well-zone completion status map as of January, 1974 was constructed using the available data. Water cuts calculated from the October, November, and December 1973 State Reports were used to initiate the construction of zonal water cut maps. Several anomalous areas developed in water cut trend. The subcommittee decided that each company should be requested to provide two

representative well tests (oil, water, and gas) on each of their wells. The first test being the most recent test just prior to January 1, 1974 and the second test being the most recent test after January 1, 1974. Shell was directed by the subcommittee to refine the water-cut maps by zone using the new well test data and present the results at the next meeting where the subcommittee will finalize the maps. Shell was further directed to construct preliminary GOR maps by zone to be finalized by the subcommittee at the next meeting.

There being no further business the meeting was adjourned at 3:30 p.m.

MINUTES OF ENGINEERING SUBCOMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
SEPTEMBER 11-12, 1974

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Houston, Texas on September 11-12, 1974. The attendance list is attached.

The meeting was called to order at 9:30 a.m. by Mr. Martin A. Thieme, representing Shell Oil Company. Mr. Thieme noted that the purpose of the meeting was to construct and finalize the Øh maps by zone, the water-cut maps by zone, the GOR maps by zone and to discuss various methods of determining remaining oil production by 40-acre tracts in Zone I San Andres.

While discussing the construction of the Øh maps, several companies stated that they would be logging wells in the near future and that these logs would be available for inclusion in the Øh map construction. The following tabulation shows the location of the wells these companies will log and the approximate time that the logs will be available to the subcommittee.

Company	Well Location	Timing
Continental	State A-29 #1 (J)	1 week
Skelly	Section 17 (M)	2 weeks
Amerada	Section 30	4 weeks
Amerada	Section 18	4 weeks
Getty	Section 19	by year end

Cities Service	Section 31 (B) Fowler #2	by year end

After discussing the relative merits of hand contoured Øh maps and computer contoured Øh maps, the subcommittee decided to combine the hand and computer contoured maps to the finalized Øh map for each zone. It was moved by AMOCO, seconded by Continental and unanimously approved by all companies present that the engineering subcommittee recommend to the working interest Owners that a cut-off date of January 1, 1975 be established for all well logging data and well test information that is to be considered by the engineering subcommittee in completing the charges given by the Working Interest Owners and that the subcommittee proceed with its work using the best available data. It was resolved that the engineering subcommittee would proceed with its work observing the January 1, 1975 cut-off date unless directed otherwise by the Working Interest Owners.

It was further moved by AMOCO, seconded by Continental and approved that the subcommittee would in constructing the finalized Øh maps use the hand contoured Øh maps as a base and make appropriate revisions as judged necessary from the computer contoured Øh maps. The voting is recorded as follows:

YES Skelly, AMOCO, Amerada, Continental, Exxon, Cities Service, Samedan, TPOC, and Shell
NO Chevron and Getty

It was moved by Skelly and seconded by Cities Service to delete the 0.7 Øh data point in Section 31 (B) on the San Andres Zone II Øh map. The motion failed with the voting recorded as follows:

YES	Skelly, Amerada, Continental, Getty, and Cities Service
NO	Chevron, Exxon, Samedan, TPOC, and Shell
PASS	AMOCO

It was moved by Shell and seconded by Chevron to retain the 0.7 Øh data point in Section 31 (B) on the San Andres Zone II Øh map and that the subcommittee effectively tighten the contour interval on this 40 acre tract and minimize its affect on the surrounding acreage. The motion passed with the voting recorded as follows:

YES	Chevron, Skelly, Continental, Getty, Exxon, Samedan, TPOC, and Shell
NO	Amerada
PASS	AMOCO and Cities Service

(It was noted that Cities Service intends to re-log this well by year end.)

The subcommittee constructed the San Andres Øh maps by zone and approved each map as finalized subject to change only by new log data secured by the subcommittee by the cut-off date of January 1, 1975. The subcommittee approval of the finalized San Andres Øh maps by zone is recorded as follows:

	San Andres Øh Map			
Company	Zone I	Zone II	Zone III$_U$	Zone III$_L$
Chevron	Yes	Yes	Yes	Yes
Skelly	Yes	Yes	Yes	Yes
AMOCO	Pass	Yes	Yes	Yes
Amerada	Yes	Yes	Yes	Yes
Continental	Yes	Yes	Yes	Yes
Getty	Yes	Yes	Yes	Yes
Exxon	Yes	Yes	Yes	Yes
Cities Service	Yes	Pass	Yes	Yes
Samedan	Yes	Yes	Yes	Yes
TPOC	Yes	Pass	Yes	Yes
Shell	Yes	Yes	Yes	Yes

As directed by the subcommittee in its April 10-11, 1974 meeting, Shell had refined the San Andres water-cut maps by zone and presented these maps for finalization by the subcommittee along with a discussion of how they were constructed. Shell noted that the preliminary San Andres GOR maps by zone had also been constructed as directed by the subcommittee in its April, 1974 meeting. Due to the hour, the subcommittee decided to defer finalization of the water-cut and GOR maps until its next meeting to be held the first week in November, 1974.

Further subcommittee work was then discussed in detail. The general consensus of opinion was that current company work loads did not permit individual subcommittee members sufficient time to do significant subcommittee work outside of subcommittee meetings and that the work would best be done in future meetings. In view of these comments, it was moved by AMOCO and seconded by Cities Service that further subcommittee work on the water-cut and GOR maps be done in

subcommittee meetings and that no additional data tabulations or maps be mailed out to subcommittee members. The motion passed with the voting recorded as follows:

YES	Chevron, Skelly, AMOCO, Amerada, Getty, Cities Service, TPOC and Shell
NO	Continental, Exxon and Samedan

Shell led a brief discussion concerning techniques for determining remaining oil production by 40-acre tracts in San Andres Zone I. Various suggestions were made by subcommittee members with no decisions being made. Due to the late hour, further discussion on Zone I was defered to the next meeting.

There being no further business the meeting was adjourned at 4:00 p.m.

The Engineering Subcommittee
North Hobbs Unit
(Addressee List Attached)

Gentlemen:

Attached are the minutes of the North Hobbs Engineering Subcommittee meeting held in Houston, Texas on September 11-12, 1974. Although we did not accomplish all of the items that were set forth on our agenda, we did have a productive and successful meeting. The next subcommittee meeting will be scheduled during the first week of November, 1974.

As a result of reassignments Mr. H. J. Swartz has become the chairman of the Engineering Subcommittee. Please change your mailing lists accordingly.

Yours very truly,

H. J. Swartz
for M. A. Thieme
Chairman Engineering Subcommittee
Proposed North Hobbs Unit

Minutes of Engineering Subcommittee Meeting
Proposed North Hobbs Unit
November 6-7, 1974

A meeting of the Engineering Subcommittee of the proposed North Hobbs Unit was held in Houston, Texas on November 6-7, 1974. The attendance list is attached.

The meeting was called to order at 8:45 a.m. by Mr. H. J. Swartz, representing Shell Oil Company. It was noted that the main purpose of the meeting was to construct water cut and GOR maps for each San Andres zone. Production and completion statistics have been updated and recorded by Shell as follows: 1) Individual well data sheets (zonal completion history and Øh, BHP surveys, monthly production history, well tests and overall assessment of current well status), 2) Updated cross sections, 3) Well status map (current completion zone and whether or not suspicion of behind pipe communication) and 4) State-witnessed "GOR" test sheets (water and gas data posted on appropriate zonal map). While preparing and collecting this data the special problem of frequent behind pipe communication became evident. Most of these wells were initially completed, during the 1930's, as open hole Grayburg - San Andres Zone I producers. Approximately fifteen years later the wells were frequently deepened to Zone III, a liner set and perforated completions made in the lower zones. In many cases the perforated completion interval has been changed several times and been subjected to several stimulation attempts with acid treatments.

Mr. R. W. Phillips presented some examples of Shell's experience with behind pipe communication problems on the McKinley A, McKinley B, Rice and State A leases. Based on the results of production tests, temperature surveys and radioactive tracer logs, Mr. Phillips believes that the water production problems experienced in these wells resulted because of the inability to isolate the production from high permeability in the Zone I San Andres reservoir. Instances of both successful and unsuccessful attempts to eliminate high water producing rates from Zone I were reported. It was concluded that behind pipe communication with Zone I is quite common throughout the field and is generally characterized by high water producing rates.

Those present decided to use the production data from the State-witnessed Annual "GOR" tests, taken during the third quarter of 1974, as the main control points. The completion status and production data posted on the zonal maps were verified and the necessary changes made. If a completion interval included a portion of a dense zone, only the productive zone was posted on the maps. The subcommittee then attempted to construct water cut contour lines for each of the four San Andres zones. The Zone I production performance appears to be indicative of edge water encroachment and a reasonable water cut map was constructed. However, the water cuts from the other zonal completions were erratic and difficult to fit to an edge water concept. It was pointed out that the subsea depth of 614 feet, that is often erroneously

referred to as an original oil-water contact, is actually the depth at which the first water production was obtained in the discovery well. This depth is an arbitrary one which has been used to define productive limits but is not intended to infer an original or current water level. Overlays of the water cut maps that had been prepared for Zones II, III_U and III_L were superimposed on the Zone I water cut map to demonstrate that the control points matched and therefore appeared to be indicative of communication problems. The consensus was that the water source was most likely the lower portion of Zone I. However, there still was disagreement over what degree of water invasion, if any, has occurred in the other zones.

A motion was made by Amerada and seconded by Skelly that all of the current water production be considered to be coming from Zone I and that a water cut map should be prepared for only this reservoir with the lower zones assumed to have no quantifiable water influx. The voting is recorded as follows:

YES: Amerada, Arco, Cities Service, Getty, Samedan, Skelly, TPOC, and Shell

NO: Continental and Exxon

A motion was made by Amerada and seconded by Continental to approve the water cut map for Zone I, as drawn, with the condition that revisions would be made as necessary to correct for new data resulting from future remedial efforts completed prior to the cutoff date of January 1, 1975. The motion was approved unanimously. A copy of this approved water cut map is attached. It is requested that each representative carefully review the completion status depicted on this map and advise Mr. H. J. Swartz, Shell (713-220-1022), of any errors.

The Committee members were advised that Shell, on the behalf of all operators, has requested the Field Permanent Bottom Hole Pressure Committee to confine the selection of key wells to twenty-four flowing producers that are completed in only one zone. Hopefully two or three surveys in each zone can be obtained. It was also requested that the shut in time be increased from 24 to 48 hours. It is believed that these changes will greatly improve the quality of the data that will be obtained during the next annual survey in April, 1975.

Construction of GOR maps for San Andres Zones II, III_U and III_L were commenced but not completed due to lack of time. These maps should be finalized at the next engineering committee meeting which will be held in Midland on December 5, 1974.

Mr. Paul Gratkowski, Shell, presented a review of the method used by the previous engineering committee to determine primary and secondary reserves by tracts. These calculations are based on the water cut, GOR and pore volume maps in conjunction with a material balance prediction of solution gas drive efficiency and a prediction of waterflood recoveries. Secondary reserves were based on a Stiles approach applied to an 80-acre five-spot

flood pattern. A decision on what changes and adjustments should be made on these techniques will be decided on at the December meeting. Also at this meeting it will be necessary to decide on a method for predicting the remaining primary reserves by tract for Zone I. Mr. H. J. Swartz, Shell, presented an example calculation which incorporated three arithmetically-weighted factors: distance from the 100 per cent water cut line, water cut and oil production rate. The engineering representatives were asked to consider what weighting should be assigned to a Zone I well that is also completed in other zones. It was requested that everyone prepare a recommended procedure for the apportionment of remaining Zone I reserves and submit it to Shell prior to December 5th if unable to attend the meeting.

Messrs. F. E. Coupal and S. B. Pontious reviewed the results of a study of the basal Grayburg net pay development. (Most of this data was sent to each member of the Engineering Subcommittee on March 7, 1974). The new data presented by Messrs. Coupal and Pontious are: 1) A tabulation of the total net pay determinations by well and 2) a total net pay isopach of this basal Grayburg sand reservoir. A copy of each of these items is attached. The separation between gas cap and oil column thicknesses will be done at a later date. It was their considered opinion that it will not be possible to sufficiently quantify the porosity variations to justify the construction of porosity - feet maps. Therefore the recommendation is to apply an average porosity to the net pay maps.

The meeting was adjourned at 3:30 p.m. on Thursday, November 7, 1974.

Minutes of Engineering Subcommittee Meeting
Proposed North Hobbs Unit
December 5, 1974

The meeting was called to order at 8:45 a. m. by Mr. H. J. Swartz. It was noted that the main purpose of the session was to construct and approve GOR maps for each San Andres zone. There was a discussion of the method of approach (using the State-witnessed GOR tests taken during the third quarter of this year as the main control points) and of the use of these maps for reserve determinations. It was unanimously agreed that a GOR map was not needed for Zone I inasmuch as it is anticipated that the remaining reserves from that reservoir can be recovered by continued water influx. A uniform current gas saturation will be assumed. All known corrections to well completion status were made. Unanimous approval was obtained for the GOR maps that were constructed for San Andres Zones II, III_U and III_L. These maps will be updated and finalized at the next Engineering Committee meeting.

A discussion followed on the technique to be used for calculating remaining primary and secondary San Andres reserves by tracts. It was agreed that a similar method to that used by the previous engineering committee would be preferable and that Shell should prepare the required predictive performance curves (based on material balance and waterflood recovery calculations). The results of these studies will be presented at a future meeting in order to obtain final committee approval before calculating tract reserves.

The need for obtaining BHP buildup surveys on selected wells were discussed. These wells are those which are flowing and which are effectively completed in only one zone. Very few wells meet these prerequisite and it was recommended that surveys be taken as near to year-end as possible in the following wells: Amerada Hess McKinley 3, III_U in Section 30(C); Continental State A-33 No. 1, III_L in Section 33 (M); Exxon Bowers A Federal No. 10, III_U in Section 29 (L); Getty McKinley No. 2, II in Section 30 (H); Gulf Grimes B-1, III_U in Section 33 (I); and Gulf Grimes A-5, III_U in Section 32 (M). It was also agreed that the Engineering Subcommittee would recommend to the Working Interest Owners that an adjustment be made to any production parameter that incurred a production loss because of these BHP surveys. In addition it is requested that each operator furnish Shell with a copy of all BHP build up data with sufficient information to make a Horner-type interpretation.

The subject of ~~procedure for apportioning by 40-acre tracts the Zone I reserves were then discussed in detail.~~ Potential factors considered were: ~~distance from the 100 percent water cut line, oil production rate, water cut, current recoverable oil in place and areal sweep efficiencies.~~ In addition, Mr. Leon Veeder, Samedan Oil Corporation, presented hypothetical calculations that predicted recoveries based on assigning different areal sweep efficiencies (between 65 and 95 percent), depending on the water cut. ~~It was unanimously agreed that a "correct" solution to this complex problem of future oil migration must consider the effect of different oil rates, porosity feet,~~

well spacing and strength of the aquifer. Simplifying assumptions could include the simultaneous opening of the entire Zone 1 productive interval in each well bore and uniform permeability, swept zone residual oil and current formation volume factor. It appeared to those present that this "correct" solution would best be done by the use of a reservoir simulation model. Shell volunteered to investigate this possibility and prepare an estimated cost for this type of study.

The question of completion intervals in Zone I affecting the production performance was discussed. Some of the representatives felt that additional work should be done to determine if various correlatable members in Zone I appeared to contain the bulk of the water. Shell volunteered to make a cursory review of the data and present the findings at the next engineering committee meeting. At that time the Engineering Committee will determine the feasibility of further study to better define the Zone I water influx.

The meeting was adjourned at 4:30 p. m.

MINUTES OF THE ENGINEERING SUBCOMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
JANUARY 22-23, 1975

The meeting was called to order at 8:45 a.m. by Mr. H. J. Swartz. Eleven companies, which operate 70 percent of the current producers, were represented (attendance list attached). The main purpose of this meeting was to finalize the porosity-feet, water cut and GOR maps for each of the four San Andres zones and to develop an approach for apportioning the San Andres Zone I reserves.

The first order of business was the finalization of the porosity-feet maps. Since the construction of the maps at the engineering subcommittee meeting of September 11-12, 1974, Shell has received 13 usable new logs. In addition, top of zone correlation changes in three wells required adjustments to the individual zonal values and a core analysis was obtained on Sweet McKinley B 1-A-G, Section 20 (I). Also, it is necessary to differentiate the Zone I porosity-feet between original gas and oil columns. All of the San Andres zonal porosity-feet maps were finalized and approved unanimously. Attached are copies of these maps and a tabulation summarizing all of the petrophysical interpretatons by wells. The original oil and gas in place in the San Andres for each lease will be determined by using the grid technique (ten-acre blocks) at the next engineering subcommittee meeting.

Grayburg net oil, net gas pay and total net pay isopach maps have been prepared by Shell. Copies of these are attached and we request that each representative review these in detail and be prepared to finalize these at the next meeting. Individual well porosity determinations cannot be made because of the lack of petrophysical data.

At the December 5 subcommittee meeting, Shell had volunteered to make a cursory review of the occurrence of net pay development with respect to completion intervals in order to determine if further study was warranted to better define San Andres Zone I water influx. The results of such a geological review were presented by Mr. F. E. Coupal. He has constructed a map with a schematic representation for each well of the vertical location of the net pay, streaks of higher than average porosity development (and presumably higher permeability), dense streaks separating pay zones, and the thickness of the argillaceous zone which separates Zone I and Zone II net pay. The location of the completion intervals was then superimposed on the pay development and attempts were made to explain anomalous water cut performance between offsetting wells. ~~It was concluded that this reservoir could not be subdivided into correlatable and extensive subzones~~. Also presented was an isopachous map of the thickness of the argillaceous zone separating Zone I and Zone II net pay. It was the consensus of the subcommittee that there is more areal separation existing between the zones than previously believed to be present.

The subcommittee then directed their attention to the finalization of the water cut maps. These maps will be used to determine the volumes of each reservoir that have been swept by natural water influx in order to ascertain tract and total reserves. The current completion status has been reviewed and many changes made. Each company representative should carefully examine the zones shown to be open to production for his wells and advise me (713-220-1022) of any disagreements. Some of these changes in completion status helped explain two anomalous areas on the Zone I water cut map drawn by the subcommittee on November 7. Firstly, the zero contour

ne in Sections 25 and 30 could be eliminated because two of the clean wells, exaco State C 1 and 2, were determined to be completed in the Grayburg only and therefore did not constitute control points. In addition, although Amerada Hess McKinley 4 is currently a clean producer from upper Zone I, production prior to ebruary 1973, was at a high water cut when all of Zone I was produced. This portion of the map was adjusted accordingly. Similarily, Mobil Berry 2, is also a Grayburg only producer and not a control point. Significant changes were also made round the Chevron lease located in Section 29. A southern offset to the Chevron ease, Amerada State A-1, was worked over in December 1974 to open the entire Zone I section to production with three other zones and is now producing at 76 percent ater cut. Based on this additional point and a study of Mr. Coupal's geologic eview, the contours in this area were adjusted accordingly. A copy of the finalized map is attached and was approved by everyone present except for a negative ote by the Amoco representative.

The question of whether or not water cut maps should be constructed for the other San Andres zones was re-examined. At the November subcommittee meeting water ut maps were drawn for each zone but because the control was sparse and questionable (behind pipe communication with Zone I?), it was decided to assume that all water production was from Zone I and that the other zones would be considered to be at the nitial water saturation. The voting on this motion was eight in favor and two (Continental and Exxon) opposed. This is the only significant disagreement in the subcommittee to date and consequently considerable time was devoted at this meeting to iscussing the "best" method of determining whether any significant water influx has curred in these other San Andres zones. It was concluded that whereas water has ..tered these reservoirs either by direct communication naturally (between I and II where no argillaceous separation exists) or because of mechanical failure (behind pipe communication), it is not possible to quantify the degree of influx on a lease basis. A statement was formulated at this meeting as follows: "It is apparent from the study of San Andres zonal production performance that Zone I is the major source of water production and encroachment and that only Zone I water saturation can be reasonably estimated on the areal basis; by the construction of water cut maps. Consequently, current water saturations for Zones II, III and III' will be estimated on a reservoir basis." This approach was approved by everyone present except for Amoco. These values for current water saturations will be approved at the next engineering subcommittee meeting.

The next order of business was the apportionment of Zone I primary reserves by tracts, assuming continued water influx. To date two methods for approximating these reserves have been presented but neither has been accepted. At the last meeting Shell volunteered to investigate the feasibility of using a reservoir simulation model to resolve the problem. Mr H. J. Swartz reported the results of consultation with Shell's computer experts. In summary, it appears that a "proven" Shell program could be used and a study completed within a reasonable period of time. However, because of the anomalous behavior of some wells (clean wells offset by high water cut producers), it is strongly recommended that a history match be attempted in order to match the general influx pattern and approximate the aquifer strength. It is recommended that this history match be attempted on a very coarse grid (10 by 15) and include the entire field. An arbitrary and quick allocation of production between ne I and other reservoirs would be necessary. It was therefore recommended by Shell hat the coarse grid approach be tried immediately and the results reported to the subcommittee in order to better ascertain the feasibility and costs of such an endeavor. The prediction mode would require a much more detailed grid and would require a ballot for approval by each working interest owner to share in the associated expenses. Each company representative present expressed the belief that the reservoir

simulation approach appeared to offer the only acceptable method of apportionment that is recognized at this time but that they would like to have the insight to future costs and complexity of resolution that can be obtained by a quick coarse grid run to be performed by Shell. Following a review of the preliminary results, a specific recommendation will be made to the Working Interest Owners Committee.

During the discussions on the feasibility of reservoir simulation, the question was raised concerning the variations in reservoir pressure between zones and areally within zones. Unfortunately, none of the requested historical BHP buildup data had been received before the meeting but based on the key well BHP statics and the analyses of four special buildup surveys, it can be tentatively concluded that the BHP in the proposed northern unit area is highest in Zone I, about 100 psi lower in Zone II, and another 150 psi lower in Zone III. It is again requested that each operator submit all BHP buildup data on all Grayburg-San Andres completions. The additional data should enable the construction of zonal pressure history with time and areal kh variances in conjunction with core analyses. The year 1974 BHP data received to date is summarized on an attachment.

Mr. P. J. Szatkowski then presented a detailed review of the planned method for calculating reserves. Key assumptions will include: current GOR, initial and current water saturations, relative permeability relationships, current pressure and abandonment pressure. Water cut (I) and GOR (II, IIIU, and IIIL) values will be determined by 40-acre tracts by "gridding" these maps at the next engineering sub-committee meeting. It was agreed at the December meeting to accept the relative permeability curves, initial water saturation and the abandonment pressure (100 psi) used in the Amoco report.

The GOR maps that were constructed at the December meeting were then finalized with unanimous approval. The only new data resulted from two Arco wells, Grimes 1 and 2, which are located in Section 28 and were both recently perforated in Zone II so that they are now producing from II and IIIU. This work resulted in overall lower GOR's which were consistent with the previously depicted GOR's for these zones. Copies of the finalized maps are attached. A reservoir-wide average GOR will be assigned to Zone I at a later date.

The meeting was adjourned at 3:00 p.m., Thursday, January 23, 1975.

#3

MINUTES OF THE TECHNICAL COMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
MARCH 5&6, 1975

The meeting was called to order at 9:15 a.m. by Mr. H. J. Swarts. Fifteen companies, which operate 87 percent of the current producers were represented during at least a portion of the two-day session. (Attendance list attached.) The main purposes of this meeting were to formulate a recommendation for determining Zone I reserves and to establish a procedure for determining San Andres zonal tract values for original oil and gas in place, average producing GOR (II, IIIU & IIIL) and average water cut (I..

At the January meetings it had been decided that Shell should make preliminary computer runs with their three-dimensional, three-phase, compressible fluid program in order to better evaluate the feasibility and costs for making an anlysis of future Zone I production by the use of reservoir simulation. The results of the preliminary efforts were discussed with the committee and are summarized as follows. The reservoir model used for these preliminary runs consisted of three non-communicating San Andres layers (I, II and III) covering the entire field with the structural location and porosity-feet values as determined by the Technical Committee. Fluid properties and relative permeability relationships were the same as those in the previous Technical Committee report. A five by ten grid was superimposed on the structure in a manner which resulted in all of the producers being located in 27 grid blocks. The wells in each grid block were summarized by completion interval and represented by one composite well, in the center of the block, containing the total zonal millidarcy-feet open to production in that grid block. An infinite and radial aquifer was placed in communication with only Zone I and input at three westerly-located points. The cumulative field production was represented as being produced at a constant rate over life. Several initial or Phase 1 runs have been made, based on the aforementioned conditions. Adjustments to the data are now being made, but in the opinion of the Shell computer experts the proposed application is feasible and Shell is willing to make the complete analysis for one set of predictive premises for a flat rate charge of $6000. This amount was determined by estimating the actual computer time needed to complete all phases of the study ($5000) and includes a $1000 estimate for contract clerical help, needed to prepare data and assemble annual production statistics for about 350 wells over a 40-year period. No charges will be made for professional or non-professional overhead nor would a charge be made for a program licensing fee. Continuation of this study, for the purposes of predicting Zone I reserves for a given set of conditions, would consist of inputting actual well production with time, and adjusting the permeabilities and various constraints until a satisfactory history match is obtained. Following this a similar history match would be obtained using a finer grid system. An analysis would then be made of future production performance for a given set of conditions. Shell would then present the Technical Committee with a report of the assumptions made and results with an interpretation of their meaning. Shell made a motion, which was seconded by Samedan, that the Technical Committee recommend to the Working Interest Owners that a computer analysis of Zone I reserves be made, for a given set of predictive conditions, on the Shell reservoir simulation program for a flat rate of $6000. The voting on this proposal was:

FOR: Amerada, Amoco, Arco, Cities Service, Continental, Getty Exxon, Samedan, Skelly, Texaco, Texas Pacific and Shell

PASS: Gulf

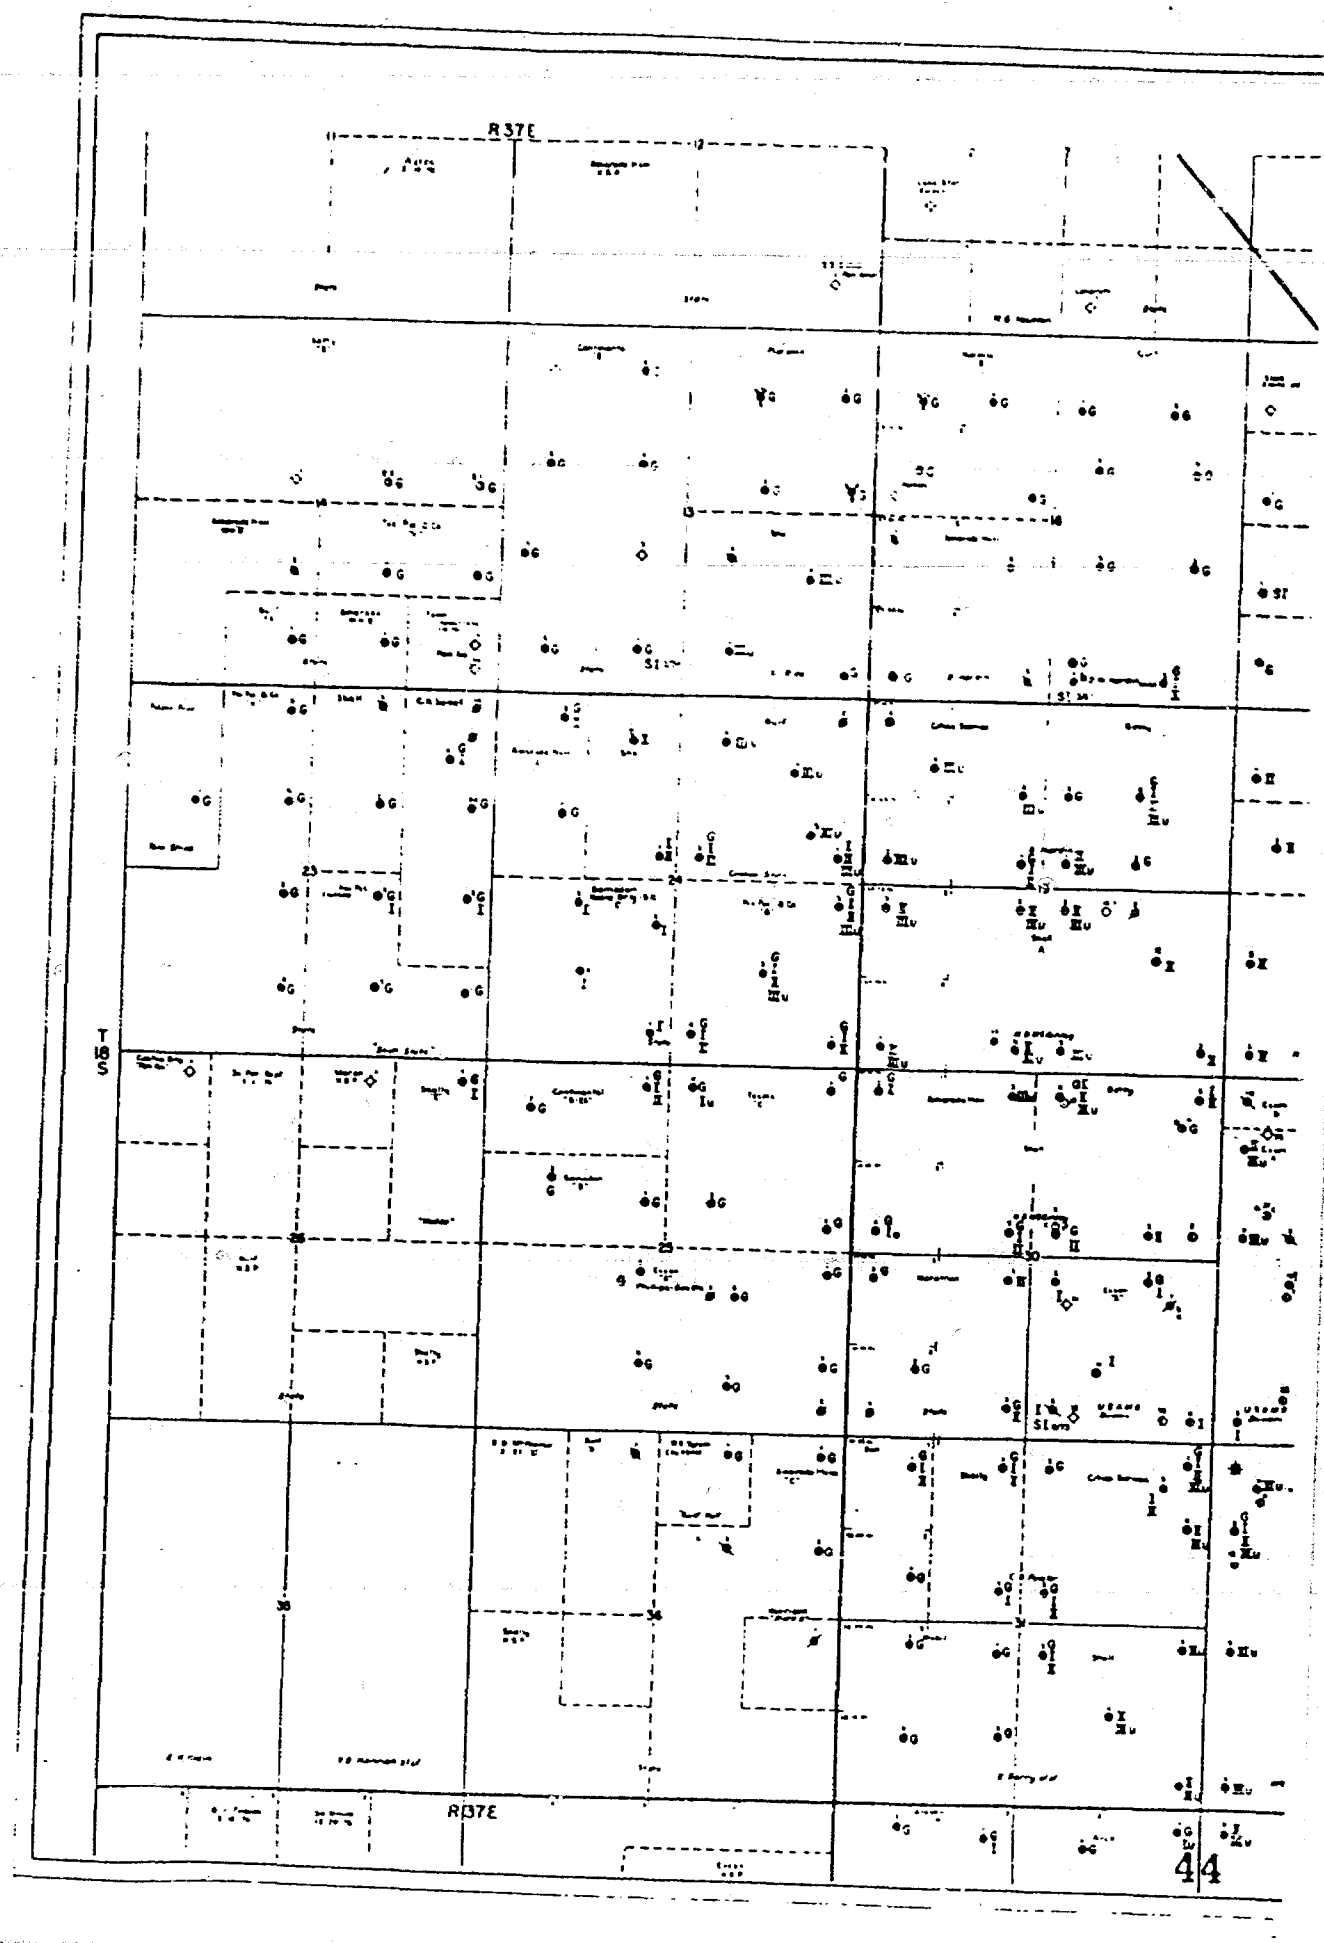
A ballot for sharing these costs will be mailed, under separate cover, to the operators. It was also recommended by the Technical Committee that the predictive mode of this study should be based on the premises that the current completion intervals are maintained status quo. This would serve as a base case and it is recognized that apportionments will then have to be made to the results in order to credit leases which have Zone I reserves but no current drainage points. Attached is a map which depicts the current completion status of each well in the proposed North Unit Areas as described in our records. It is imperative that each operator verify this description and notify me (713 220-1022) of any discrepancies.

The next order of business was a presentation of average zonal porosity and permeability values. Average porosity values have been obtained from both log and core analyses and are considered to be reliable inasmuch as they are generally accurately measured and represent excellent areal coverage of the proposed unit area. The average permeability values are more questionable because of the wide range in values and the limited data. Permeability values were averaged from three sources: cores, buildup pressure analyses and those used by the previous Technical Committee. The core-derived values exhibited large differences and the data were averaged both arithmetically and geometrically for all available core analyses from wells within one mile of the proposed unit area. Arbitrarily the average of these two summations (arithmetic and geometric) was used as representative of the cored values. Stratification analyses, using the Dykstra-Parsons variance approach have been made and will be used as a guide for the reservoir simulation study. Shell has measured 83 BHP buildup surveys in 24 different wells. Only 29 of these, taken in 10 wells, are representative of single zone performance. In addition three of the four buildup surveys that were requested by the Technical Committee, at year-end, were usable for permeability determinations. Since no other company has ever taken buildup surveys in the proposed unit area, the resulting averages from this source are representative of only limited portions of the reservoirs. The previous Technical Committee used zonal permeability values which were derived from cores and adjusted to fit performance. A comparison was also made, by Shell, of the initial potential tests of all wells completed by 1931. This data was recorded on a map and iso-potential lines drawn. These date can only be used in a qualatative manner but strongly indicate that the lowest productivities are in the south unit area whereas a fairway which generally follows the structural highs is located in the northern unit area and average to good productivities occur in the remainder of the wells. The resulting average permeabilities, which are summarized in the attachment, are therefore considered to be tentative. Additional insight into actual values should result from the reservoir simulation study and will be incorporated with these aforementioned values.

At the last meeting it was decided to assign reservoir average current water saturation values to the Grayburg and San Andres (II, IIIU & IIIL) and reservoir average current gas saturations to the Grayburg and Zone I.

These values were in lieu of tract determinations and would be used in calculating reserves in conjunction with relative permeability relationships. Producing data from "key wells" are being assembled but it is believed that valuable insight as to the degree of water influx into the lower San Andres will be gained from the computer analysis. In addition, similar relative permeability relationships should be used for estimating current gas and water saturations from producing gas-oil ratios and water cuts. It is therefore recommended that the determination of these average values be made at a later date.

Approval of the Grayburg net oil, net gas and total net pay isopaches maps was deferred at the request of one of the representatives in order to permit a more detailed check of the values used.



The Technical Committee then decided to determine tract values from the approved San Andres porosity-feet and Zone I water cut contour maps by using a ten-acre grid system whereas the GOR values would be based on a 40-acre grid. Values were selected for each grid block and were based on mechanical interpolation between contour lines. The determinations of tract value for original oil and gas in place, current saturations and remaining primary and secondary reserves will necessarily be made at a later date and then presented for review.

WELL STATUS

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
June 4, 1975

The meeting was called to order at 8:45 a.m. by Mr. H. J. Swartz. Thirteen companies, which operate 85 percent of the current producers were represented. (Attendance list is attached.) The main purposes of this meeting were to:

1) describe the reservoir simulation models and techniques that are currently being used by Shell for this unitization effort and

2) determine a method for constructing acceptable Grayburg net pay isopach maps.

Mr. W. C. Miller, supervisor of the reservoir simulation group at Shell Development Company, presented a detailed description of the reservoir simulation model being used by Shell to analyze the San Andres reservoir performance and in particular to determine Zone I reserves. The model can be briefly described as a three-phase, three-dimensional, compressible fluid reservoir simulation program. A relatively coarse grid of 150 blocks (ten by five areally with three zones vertically) is being used in the initial phase of this study. Each block contains about 500 acres and the anticlinal structure is included by digitized data on the top of Zone I porosity and the gross thicknesses for each San Andres Zone (I, II and III) for each block. Similarily, each block's zonal net pay was determined from porosity-feet isopach maps (constructed by the current Technical Committee for the North Unit area and by the previous Technical Committee for the South Unit wells) and the average porosity attributed to each zone. The initial gas-oil-contacts and water-oil contacts are 360 feet subsea and 614 feet subsea respectively. This mathematical representation contains an original oil-in-place for the San Andres of 835 million STB, which compares favorably to the 819 million STB calculated by the previous Technical Committee.

Input gas-oil relative permeabilities are the same as the rock curves previously used, but the oil-water relative permeabilities have been adjusted to reflect the Dykstra-Parsons stratification calculated from cores in the North Unit area. The aquifer is strategically located at three locations and communicated only with Zone I.

Oil production and zonal completion history have been input by well in five-year increments up to 1970, then the next three-year period and finally 1974 production. The latter is actually based on the rates reported in the State-witnessed annual gas-oil ratio tests taken in mid-1974. These tests have been judged, by the Technical Committee, to be the most reliable indicators of current conditions. Each well's oil rate is automatically allocated by the simulation program to the zones open to production during its entire history. The pertinent factors such as each zone's pressure, permeability, fluid saturation are accounted for in the calculations for each well. Zonal production rates are computed and a history match, for each well, is based on a comparison of cumulative oil, cumulative water, BHP history and current rates; with emphasis on current conditions.

Once a satisfactory history match is obtained, the predict mode will be run with the current completion intervals open. Each well's primary reserves will be computed by the simulator. A similar simulation, history match and comparable predict mode will then be made using a finer grid system in order to check the sensitivity of the results to this parameter. These results will then be presented to the Technical Committee at which time it will be determined what additional work is required to assign Zone I reserves by tract.

Following Mr. Miller's presentation, Shell requested an expression of opinion from those present as to whether or not there were any objections to the assumptions made or techniques being used or any suggestions. Mr. Joseph C. Solari, Chevron, suggested that the computed current tract saturations by zone, be compared to the water cut and GOR maps, prepared by the Technical Committee. It was also brought out that the computed ultimate recoveries should furnish additional insight into both primary and secondary recovery efficiencies and the crossflow volumes with time into the various San Andres layers. It may also be desirable to use this reservoir model as a basis for waterflood predictions

Concurrent with this major reservoir simulation effort Shell plans to investigate waterflood recoveries with the use of reservoir model work on both the Grayburg and the Zone III lower San Andres reservoirs. The Grayburg analysis will be based on a five-spot 40-acre symmetry element which is representative of the Grayburg reservoir considered to be floodable (northern and western flanks). The history match will be made by comparing current average well producing characteristics. It is intended to simulate the performance of the San Andres III Lower reservoir by modeling the entire reservoir, as described by the current Technical Committee work, and comparing the results of water injection under at least two different injection patterns. The benefits of infill drilling will also be examined with this model.

An error in the productive limits of the Zone I oil column porosity-feet map was shown to the Committee. The problem was caused by a miscorrelation of the top of the San Andres in that area and results in only a slight adjustment to the original oil-in-place values for the Gulf Hardin (Section 18 A, B and H) and Moranco State (Section 17E) leases. To date only twelve of the twenty-five operators have returned the forms for verification of tract original hydrocarbon-in-place values. A revised tabulation will be distributed as soon as all of the necessary corrections have been received. Three minor adjustments are also required to contours on the Zone I water cut map. These concern the 25 percent water cut line in the SE/4 of Section 34 (should curve north of Samedan Turner B-2) and the 50 and 75 percent water cut lines in the NE/4 of Section 30 (75% should be west of Getty McKinley 1 and the 50% bowed accordingly). It was also pointed out that Mobil Berry No. 4 (Section 31M) is currently completed in both the basal Grayburg and an upper Zone I (four net feet of pay) stringer. During the 1974 annual GOR State Test the well produced 30 BOPD plus 18BW but it is mapped, by the Technical Committee, to be completely

watered out in Zone I. Following a discussion and further review of the situation it was unanimously decided that the map is correct as drawn. If anyone knows of any descrepancies on any of the maps distributed to date, please advise me as soon as possible inasmuch as we intend to soon have these maps drafted for the Technical Committee report.

Mr. F. E. Coupal presented net pay continuity maps for each of the four San Andres reservoirs. These representations are based on determining how much of the net pay in each well zone is correlatable with the net pay development in each of the direct offsets. The net pay continuity appears to be very good and the reservoir averages are: Zone I, 94 percent; Zone II, 93 percent, Zone III_u, 90 percent; and Zone III_L 93 percent.

The current well status tabulation, furnished to each operator with our letter of May 14, 1975, should be checked carefully and returned to me as soon as possible. Particular attention should be paid to the completion interval and that the elevation shown is compatible with these measurements. Logs run in these wells have used every imaginable elevation datum and some are unique. If you have any questions about this tabulation please call either Frank Coupal (220-1333) or Hank Swartz (220-1022). Your cooperation in carefully verifying this tabulation and that of the original hydrocarbon-in-place is greatly appreciated.

Exxon Company, U.S.A. had previously expressed concern that the Grayburg net pay values selected from logged wells might include some siltstone or nonproductive rock. (See their letter dated May 2, 1975.) Mr. John M. Clayton, Exxon, summarized his work on the problem and pointed out that the production statistics on the western flanks of the proposed unit area seem to indicate that the southern wells have performed much better than the northern producers in contrast with Shell's net pay depiction which shown both areas to have similar net pay development. In summary, Exxon feels that these net pay representations should be modified. Mr. F. E. Coupal then reviewed the geologic premises used and pointed out that the nine zones at the top of the basal Grayburg are correlative across the entire field whereas the underlying wedge of net pay is more erratic in occurrence. He then distributed statistics which geographically summarized the distribution of net pay based on data from 18 cored wells. The tabulation included comparisons of cored well net pay with log-interpreted net pay and a break-out of non-permeable (less than 0.2 md) rock over 11% porosity. A tentatively revised Grayburg net pay map was presented based only on core data and a few logged wells with net pay estimates compatible with nearby cored wells. The revised map did not reflect the differences in productivity along the west flank as interpreted by Exxon. Inasmuch as no other suggestions were made, Shell voluntered to:

1) prepare Grayburg net pay isopach maps of both only the nine correlatable zones and only the underlying wedge and

2) recompile the Grayburg production statistics, in a similar fashion as that presented by Exxon, but adjusted to remove the volumes which are believed to have been produced from the San Andres reservoirs.

It was requested that Shell furnish the other operators estimates of the timing of unitization and the amounts of capital investment that will be required for secondary recovery operations. In response to this we tentatively predict the following schedule:

December 1, 1975, publish the Technical Committee report;
October 1, 1976, effective date of unitization;
and May 1, 1977, initiate water injection.

Preliminary estimates of the capital investment requirements are $12,000,000 initially and another $3,000,000 within the following two years.

MINUTES OF THE TECHNICAL COMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
OCTOBER 14 and 15, 1975

A meeting of the Technical Committee was held on October 14 and 15 in Midland, Texas. The major objectives of these sessions were to review net pay isopach maps of the Grayburg formation and to determine primary reserves of the Grayburg and upper stringer San Andres producers by the extrapolation of production performance. Fourteen companies, which operate 79 percent of the current producers were represented on Tuesday and eleven companies (76 percent of the wells) were represented on Wednesday. Attendance lists for both sessions are attached.

A brief review of previous Grayburg studies prepared by Shell for the Technical Committee was presented for reference. These include a report distributed on March 7, 1974 and an update which was presented at the Technical Committee meeting held on November 6, 1974. Net pay isopach maps, based on log and core data, were prepared by Shell and distributed to Committee members on February 10, 1975. Discussion of these maps are included in the minutes of the Technical Committee meetings held on March 6, 1975 and June 4, 1975. At the June meeting it was recommended that Shell prepare revised net pay isopach maps that would be based only on core and selected log data. It was also requested that the basal Grayburg horizon be subdivided into an upper interval (comprised of nine correlatable sands) and the lower ("wedge") interval. In addition it was recommended that Shell evaluate the amount of cumulative oil production attributable to the Grayburg, by wells, particularly along the northern and western flanks.

Mr. E. W. Kitchen who has replaced Mr. F. E. Coupal as Shell's Geological Engineering representative on the Technical Committee then presented the four revised net pay isopach maps (oil and gas pay maps for both basal Grayburg zones. These maps were based only on the data from cored well and selected logs (good quality logs which indicated similar net pay/gross interval thickness ratio to those calculated from "nearby" core control points). The enclosed type logs on Shell Rice 4 and Amoco State G5 show the stratigraphic intervals that were mapped. He then presented structure maps on the top of the Grayburg and the four San Andres subzones. Maps were also presented which reflected the cumulative oil production believed to be definitely from the Grayburg and an arbitrary allocation between zones where the Grayburg and San Andres production had been commingled. These determinations indicate that whereas the differences in production performance between areas is not as great as indicated by Exxon at the last meeting, it does appear that the wells along the southwestern flank, particularly those located in Sections 25, 31 and 36 have been the most prolific Grayburg producers.

Considerable discussion followed and revolved primarily about the problem of interpolating or contouring net pay values in areas of limited control. It was concluded that an attempt should be made to first construct percent net pay to gross thickness ratio contour lines for each map which could then be used in conjunction with the gross thickness of each well (determined from logs and/or structure maps) in order to develop the isopach of net pay maps. These percent net to gross ratio maps were constructed and reviewed and considerable discussion followed on the techniques used and whether or not these ratio maps should be segregated on the basis of fluid content or drawn irrespective of contacts. The Technical Committee members finally decided that the percent net to gross ratio maps are a reflection of rock quality and should be independent of fluid content. Therefore, it was recommended that Shell should construct these maps, using only the core and selected log control points applicable to each stratigraphic interval, for each of the two basal Grayburg zones. It was also agreed that Shell should submit these two percent net pay to gross thickness ratio maps to each Committee member in order to obtain approval prior to constructing the net pay oil and gas maps for each zone.

The techniques to be used for determining the remaining primary reserves were then discussed. The enclosed map shows the location of eight groups of wells that are within the proposed unit area and have remaining primary reserves. The majority of the wells are currently producing from one or more of the San Andres zones and the primary reserves for this group will be determined with the use of the reservoir simulation study which is now in progress. The remaining wells are producing from the Grayburg formation and/or the upper San Andres stringer zones. It is recommended that the primary reserves for these wells be determined by extrapolating production performance or by a similar type approximation. Individual decline curves have been prepared for 62 of these wells and each well has been categorized into one of six groups based on similar geographic location and producing characteristics. A composite production curve has also been prepared for each of the six groups and all lease production curves have been updated.

Each Committee representative present analyzed the production performance of these 62 wells, six composite group and eleven lease curves. The annual decline rate and corresponding initial rate was estimated for each of these curves. The reserves determined from these estimates will then be averaged for each curve and the results distributed to all of the Technical Committee members.

The "Well Status" tabulation has once again been revised and a corrected copy will be distributed. One of these elevation changes, to Continental State A-33 No. 4 (33 J), resulted in a redistribution of the amount of porosity-feet in the Zone I gas and oil columns and consequently contour changes to the porosity-feet maps in Zone I. These changes result in a net increase of 201 MMCF for the OGIP and a net decrease of 395,658 BO for the OOIP. Corrected sheets will be sent out to reflect these changes. These and all previous changes to the porosity-feet maps were shown to the Committee.

The need for determining current CIP, by tracts, was discussed. This parameter will be based on tract values of GOR (determined from previously constructed GOR contour maps for II, IIIU and IIIL zones and an average reservoir value for Grayburg and I) and water cut values (determined from contour map on I and estimated average reservoir values for the other zones). In addition to possible use as a parameter, these values will be used as the basis for apportioning secondary reserves to each tract.

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
January 13-14, 1976

The meeting was called to order at 9:30 AM. Fifteen companies, which operate 86 percent of the current producers, were represented (Attendance List is attached). The sole purpose of this meeting was to redetermine tract primary reserves for those wells producing from the Grayburg and/or upper San Andres stringers.

Mr. Swartz initiated the meeting with a review of work done to date for determining primary reserves. In summary, the primary reserves for the proposed North Hobbs Unit is being determined by two methods: (1) by analysis of production performance for all wells which are currently considered to be producing from the Grayburg and/or upper San Andres stringers and (2) by a reservoir simulation study (currently in progress) for all wells currently producing predominantly from the San Andres reservoir(s). There will be no overlap as each well has been placed in only one of the above categories.

A plan of attack was then developed by the Committee members. It was decided to first assign reserves to all of the applicable lease and composite groupings. Then wherever the lease production performance curve could not be used (i.e. when most of the current production on a lease is from wells completed in the San Andres reservoir); the reserves were estimated from the individual well decline curves. These curves have all been updated to include at least the production between January, 1972 and October, 1975. In many cases the November and December, 1975 production figures were also available as well as the production prior to January, 1972 for all of the one-well leases. The sum of all the wells within a group (groupings are described in prior correspondence) were then compared to the extrapolation of the applicable Composite Group curve as a check of the reserves so estimated.

All of these production performance curves were projected with a view graph and an annual decline rate (dy) and an initial 1/1/76 rate (q) was determined by those present. Complete agreement was obtained for each curve and the 1/1/76 reserves were calculated using an economic limit of one BOPD/well. These determinations are summarized on the attached tabulation and are considered to be final.

Subject: Technical Committee Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

Technical Committee
(Addressee List Attached)

Gentlemen:

Attached are the minutes of the Technical Committee meeting which was held in Midland, Texas on January 13 and 14, 19[illegible].

At this meeting the primary reserves were finalized for all wells which are currently producing from the Grayburg and/or upper San Andres stringers. This totals about 1.3 million barrels for 63 producers. Primary reserves for the remaining wells, which produce predominantly from the San Andres reservoir(s), are being determined with the use of a reservoir simulation computer program.

It would be greatly appreciated if each Company would return the ballots on the revised percent net pay to gross thickness ratio maps for the upper and lower Basal Grayburg Zones. (These were sent with letter dated December 31, 1975.) Once the volumetrics on the Grayburg are completed we will finalize a waterflood plan for this reservoir.

Yours very truly,

H. J. Swartz

H. J. Swartz, Chairman
Technical Committee

MINUTES OF THE TECHNICAL COMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
MARCH 25, 1976

The meeting was called to order at 9:15 AM. Fourteen companies, which operate 79 percent of the current producers, were represented. (Attendance list is attached). The main purposes of this meeting were to: (1) finalize net pay isopachs of the Grayburg formation, (2) present the results of a Grayburg waterflood evaluation on a 40-acre symmetry element and (3) decide on a waterflood plan for the Grayburg reservoir.

Mr. E. W. Kitchen presented a brief review of the method and decisions involved in the construction of the four Grayburg net pay isopach maps. Copies of these maps were mailed to each representative with the letter calling the meeting. After a brief discussion the maps were unanimously approved as drawn. It was requested that committee members review all maps submitted to them today for accuracy of information and data since these maps will be sent for drafting in final form shortly. The tract values of original hydrocarbons-in-place will be determined from these maps by use of the "gridding" technique with a ten-acre grid. Tabulations of the tract values and copies of the gridded maps will be sent to each operator for verification.

Mr. R. J. Swartz presented the results of a reservoir simulation study of the Grayburg formation. This analysis was done with the use of a three-phase, three dimensional, compressible fluid reservoir simulation program using a 40-acre symmetry element and a 9 by 17 grid system. The reservoir volume represented was 1028 NAF with an average porosity of 14 percent, water saturation of 30 percent and average permeability of 5 millidarcies. The value of permeability was determined by trial and error by comparing recent production history and water injectivities using the Moranco waterflood experience as a guide. Pseudo relative permeability curves were constructed using a Dykstra-Parsons variance factor of 0.7 (determined from 256 core samples) and a five layer stratification.

Based on the production history of 69 wells which were producing predominantly from the Grayburg, the average producing characteristics at January 1, 1975 were estimated to be 15 BOPD per well with a GOR of 5035 cubic feet per barrel. Fractional flow equations were used in conjunction with the pseudo relative permeability curves to relate this GOR to an average gas saturation of 19 percent and an average oil saturation of 51 percent. These values represent a cumulative oil recovery of 16.23 percent of the OOIP or about 10.2 million barrels, which fits prior estimates of cumulative oil production allocated to the Grayburg. The average reservoir pressure at January 1, 1975 was estimated to be 400 psig at 400 feet subsea.

Using these initial conditions, a base case was run to establish the results to be expected for continued primary depletion as a function of time. This analysis indicates that ultimate primary recovery (to an economic limit of one BOPD per well) would be 1098 STB per NAF or 18.7 percent of the OOIP. The January 1, 1975 reserves are 14.9 STB per NAF. Assuming that water injection would be initiated in mid-1978, this base case indicated that the average oil saturation at that time would be 48.6% and the reservoir pressure would be 220 psig.

A waterflood program using a five-spot pattern resulted in an ultimate recovery efficiency of 33.1 percent. This reflects an additional 84 STB/NAF (14.4%) of secondary oil per five-spot pattern. Economic analyses were made for this case and infill drilling. The effects of pattern skewness and shutting in producers to conserve reservoir energy were also evaluated with the computer program.

The conclusions reached from this study and discussions with the Technical Committee are summarized as follows:

(1) Because of the low permeability of the Grayburg reservoir it will be necessary to use a pressurized injection system (about 1500 psig surface) and a ratio of one injector per producer (five-spot or line drive pattern).

(2) An 80-acre five-spot waterflood is economically attractive. However, a complete infill program (40-acre five spot) cannot be economically justified at this time. The flood performance is improved if high GOR-low oil rate producers are shut-in while injecting water during the 5-year fillup period.

(3) Final pattern selection and well utilization should be made after the San Andres water injection program is finalized.

At the Technical Committee meeting of December 5, 1974, special BHP buildup surveys were requested in four selected wells. It was agreed that the Technical Committee would recommend to the Working Interest Owners that an adjustment be made to any production parameter that incurred a production loss because of these BHP surveys. Several methods were discussed at this meeting and it was then decided to adjust any parameter affected by averaging each well's production for two months prior to the survey and two months afterwards and subtracting the actual production obtained during the survey month(s). The well involved and the adjustment are:

Well	Location	Date Shut-In	Hours SI	Adjustment (Bbls.)
Amerada McKinley 3	30C	1/06/75	67	240
Exxon Fed. Bow. 10	29L	12/30/74	70	200
Getty McKinley 2	30H	12/11/74	72	0
Marathon State 30-1	30K	12/02/74	67	589

It was requested that all Technical Committee representatives carefully review the "Well Status Summary" (last revised 10/15/75) mailed with our letter dated October 31, 1975, and advise H. J. Swartz (713-220-1022) whether or not the data are correct as shown.

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
October 13, 1976

The meeting was called to order at 9:00 a.m. Seventeen companies, which operate 90 percent of the current producers, were represented. (Attendance list attached). The main purpose of this meeting was to present the results of Shell's reservoir simulation study of primary recovery performance from the San Andres.

Mr. Swartz presented a brief review of the history of Technical Committee progress and emphasized the following points:

1. Attempts to form a fieldwide unit were aborted during 1973, primarily because of disagreement over the determination of remaining primary reserves.

2. Resolution of the problem of determining tract reserves (both primary and secondary) for the proposed North Unit should eliminate the last major hurdle for the Technical Committee.

3. The main complication for determining tract primary reserves is the existence of strong water influx into the upper San Andres (Zone I). This water drive is primarily from west to east and has caused an unusually large amount of oil migration and maintained the reservoir pressure and consequently the productivity of Zone I at higher levels than in the other productive intervals. This is particularly evident along the eastern flank of the proposed North Unit area.

4. Two prior methods for allocating tract primary reserves for the San Andres have been presented to the committee at meetings held on October 5, 1974 and November 7, 1974. Both were rejected and subsequent discussions led to the conclusion that the problem would best be resolved with the use of a reservoir simulation study.

5. A letter ballot, dated March 13, 1975, for a Shell computer study at a flat rate of $6000 (estimate based on computer time and outside clerical help only) was approved by 88.52 percent of the operators with only one dissenting vote.

6. Consequently Shell made a feasibility study and at a Technical Committee meeting held on June 4, 1975, Mr. W. C. Miller, section leader of the reservoir simulation group in Shell's research organization, presented a description of the mathematical model and techniques that would be used.

7. Primary reserves have already been determined by the use of production decline analysis for 62 wells which produce from the Grayburg and/or upper San Andres stringers. Please refer to the enclosed map (Figure 1) which shows those wells included in the reservoir simulation study.

8. Prior to completing the reservoir simulation study it was thought that it would be necessary for the Technical Committee to reallocate reserves to wells located in a common grid block. However, because of differences in completion zones and well model characteristics, it is believed by Shell that representative and equitable primary reserve determinations have been simulated on an individual well basis.

Mr. W. C. Miller then reviewed the premises, model description and the results of the history match. Discussion centered about the following points:

1. A 10 by 20 grid system, depicted in Figure 2 was superimposed on all completions in the field using a three-layer representation for the San Andres reservoirs (I, II and III_U/III_L).

2. All of the Technical Committee data developed to date were input for reservoir description. These include: Structure maps (fitted with curvilinear coordinates for a smooth surface as shown in Figure 3), individual well zonal porosity determinations, zonal original hydrocarbons-in-place (using the previous Engineering Committee work for the South Hobbs Unit area) and rock relative permeability curves modified to pseudo curves by stratification effects.

3. Oil production history, from initial completion to January 1, 1976, was input for every completion in the field after factoring out a minor amount attributed to the Grayburg formation on the basis of relative permeabilities and well storage differences in the completed intervals.

4. The actual well completion history (zone changes) were input in five-year intervals and the "current" (January 1, 1976) completion zones are shown in Figure 1. As previously decided by the Technical Committee, all wells producing in excess of 100 BWPD but not completed in Zone I were assumed to have behind pipe communication with that zone.

5. As previously discussed at previous sessions there are many indications of preferential flow channels. One obvious example is between two wells (29P and 28M) which although they are located about 700 feet apart and are both apparently completed in equivalent Zone I sections, one is a clean oil producer and the other makes in excess of 70 percent water cut. In view of this and other anomalous production performances it was necessary to establish flow channels (in Zone I only) in order to obtain a satisfactory history match. The transmissibilities of these flow channels were varied but it was found necessary to use a value of zero. The flow channels or barrier locations are depicted in Figure 4.

6. The quality of the history match was evaluated primarily by comparing the calculated zonal water production rates for each well to those reported to the New Mexico Conservation Commission during the year 1975. Attention was also focused on current zonal and areal reservoir pressure variations and comparisons with measured data reported at prior meetings. Figures 5 thru 10 represent both qualitative and quantitative comparisons of these data.

7. Shell believes that a good history match has been obtained, especially considering the interzonal interactions resulting from multicompletions, variations in reservoir pressure and selective completions intervals.

Following these discussions, Mr. W. C. Miller then presented the results of the prediction phase and emphasized the following points:

1. As decided by the Technical Commettee, the predict was run with each well retaining the current completion interval for the remaining life.

2. A top allowable well was assigned a January 1, 1976 bottom hole flowing pressure of 300 psi whereas the remaining wells were assumed to have 100 psi flowing bottom hole pressures. These top allowable wells are designated on Figure 11.

3. The permeability - thickness product of each well in each zone had been automatically varied throughout the history match to simulate actual performance. The last adjusted zonal kh for each well was kept constant during the predict mode.

4. The economic limit was arbitrarily selected to be 5 BOPD and/or 95 percent water cut and the prediction terminated at the end of year 2024.

5. It was assumed that those wells which contain a Grayburg completion with the main San Andres would not obtain any future primary reserves from the Grayburg because of the significant differences in permeability - thickness products and static reservoir pressures.

6. The predicted performance of each well was then summed into field, lease and operator totals which are summarized in Figures 12 thru 15 The estimated future rates were plotted on the enclosed lease production graphs. The previously estimated (by decline curve analysis) production for Grayburg and/or Upper San Andres producers has been added to the simulated predictions for the main San Andres wells where a lease contains wells in both categories.

Shell believes that the resulting predictions are reasonable and equitable projections of future performance. The economic limit was subsequently recalculated at the decontrolled stripper oil price and is 3 BOPD or 99 percent water cut, whichever is reached first. The results using the higher economic limit is labelled "Set A" whereas the recommended runs with the lower economic limit are designated as Set B. Figures 16 thru 19 are summary tables of actual and estimated primary oil performance from the San Andres reservoir for both the field and the proposed North Unit by zones and in total. Figure 20 is a summary of recent production statistics for the North Unit.

The Technical Committee members were asked to suggest variations to the simulation runs presented. None were suggested at the meeting but it was left open so that any Technical Committee representative wishing a variation in the assumptions should call the Chairman of this committee. It was requested that every one come to the next meeting on November 4, 1976, be prepared to vote on acceptance of this simulation study as the basis for tract primary reserves for those wells in the study area. Shell recommends using the San Andres primary reserves which are summarized in Set B. We feel that these represent equitable estimates and are much more representative than those obtained by methods previously suggested to the Technical Committee.

MINUTES OF THE TECHNICAL COMMITTEE
PROPOSED NORTH HOBBS UNIT
NOVEMBER 4, 1976

The meeting was called to order at 8:15 a.m. Thirteen companies, which operate 82 percent of the number of current producers, were represented. (Attendance list attached). The main purpose of this meeting was to vote on the acceptance of Shell's reservoir simulation study as the basis for the determination of primary reserves from the main San Andres reservoirs.

After considerable discussion and vote taking it was decided to take the following course of action:

1. Accept Shell's reservoir simulation approach as the best method for determining primary reserves from the main San Andres reservoirs.

2. Approve the techniques and mathematical descriptions used by Shell and as presented to the Technical Committee at the October 13, 1976 meeting by Mr. W. C. Miller of Shell Development. (Skelly registered the only no vote based on the results obtained for their Turner lease relative to offsetting tracts.)

3. Approve the approach that the primary reserves parameter for those wells included in the reservoir simulation study would be based on the assumption that the current completion status (shown in Figure 1 attached to minutes of October 13, 1976 meeting) would be constant over the remaining life.

4. Update the reservoir simulation history match to include the first eight months of 1976 oil production. The determination of each well's permeability thickness (kh) should be based on the last twelve months of history. (Wells that have been shut in during July and August 1976 due to overproduction of gas would use the prior ten months (9/75 to 6/76) as the base for determining kh. These wells are: Arco Grimes SOC 1 and 2 (28E&F), Conoco Grimes 1, 2 and 4 (28O, P and I) and Conoco State A-29-3 (29K).)

5. Rectify an apparent discrepancy between actual production and computed production for the Getty Hardin Lease in Section 19.

6. Move the two Skelly Turner wells (34C and F) from grid block 12, 2 to grid block 12,1 in order to obtain a better match and representation.

7. Use an economic limit of 3 BOPD or 99 percent water cut and all production stopped on December 31, 2024.

Shell agreed to make the preceding changes and distribute the results of this analysis to all Technical Committee members (in approximately one week). Shell pointed out to the Committee representatives that this would be the final simulation run under the agreement set forth in the letter dated March 13, 1975 about the computer analysis for this field.

It was decided to reconvene in two weeks (November 17 and 18) to cover the agenda scheduled for this meeting.

In response to several requests for information on other participation parameters determined to date, a tabulation of ten parameters was distributed and a copy is enclosed with these minutes. Also a summary of a conservative economic analysis of a unitized waterflood was shown; a copy of that summary is also attached.

PRELIMINARY ECONOMIC ANALYSIS
PROPOSED NORTH HOBBS UNIT

ASSUMPTIONS:

1. ADDITIONAL OIL BY WATERFLOODING IS 30 MMB OR ABOUT 7% OF THE OOIP IN GB, II, III_U, III_L ZONES. (THE SECONDARY OIL RECOVERY OF 30 MMB IS EQUIVALENT TO A SECONDARY TO PRIMARY ULTIMATE RATIO OF 0.28 FOR THESE ZONES.) THE WATERFLOOD LIFE IS 35 YEARS.

2. CAPITAL INVESTMENT IS $16,000,000 INITIALLY AND $4,000,000 TWO YEARS LATER.

3. A CRUDE OIL PRICE OF $5.911 PER BARREL IS USED THROUGHOUT. THERE IS NO ESCALATION FOR OPERATING COSTS. THE OPERATING COSTS USED FOR THE WATERFLOOD ARE 44% HIGHER THAN THE EQUIVALENT FOR PRIMARY OPERATIONS TO PROVIDE FOR AN INCREASED AMOUNT OF WORKOVERS AND WATER COSTS (PURCHASING AND HANDLING).

RESULTS:

1. THE ADDITIONAL OCI (UNDISCOUNTED AND BEFORE FIT) IS $3.80 PER BARREL OF OIL. THE ADDITIONAL OCI (DISCOUNTED AT 10% AND BEFORE FIT) IS $1.75 PER BARREL OF OIL. THE AVERAGE ANNUAL EARNING POWER (BEFORE FIT) IS 33% AND THE PAYOUT OF THE CAPITAL INVESTMENT IS 4.1 YEARS. THE UNDISCOUNTED PROFIT IS $94 MILLION OR 470% OF THE REQUIRED CAPITAL INVESTMENT.

NOTE: THIS IS AN INTENTIONALLY CONSERVATIVE PROFITABILITY TO DEMONSTRATE AN ECONOMICALLY ATTRACTIVE PROSPECT EVEN WITH LOW OIL RECOVERIES AND HIGH COSTS.

November 8, 1976

Subject: Technical Committee Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

Technical Committee
Proposed North Hobbs Unit
(Addressee List Attached)

A two-day meeting of the Technical Committee is called for Wednesday and Thursday, November 17 and 18, 1976, at 8:00 a.m. in Conference Room 19109, Entex Building, 1200 Milam Street, Houston, Texas.

The agenda for this meeting is:

1. Vote on approval of Shell's reservoir simulation study for determining San Andres primary reserves by tracts. (See attached minutes).

2. Review primary reserve determinations made from decline curve analyses of wells producing from the Grayburg and/or upper San Andres stringers. (See Minutes of January 13 and 14, 1976, Technical Committee meeting). The production performance curves have been updated and there are some wells that have not yet been analyzed.

3. Discuss the procedure to be adopted for allocating secondary reserves to tracts.

4. Other business.

This agenda is the same as scheduled for the Technical Committee meeting held on November 4, 1976. Attached are the minutes of that session which show that only the first agenda item was discussed in detail. Whereas there is agreement with the assumptions and techniques used by Shell in their reservoir simulation study, sufficient modifications to the October 18, 1976 analysis (summarized in Figures 14 and 15 of the enclosures sent with the minutes of the October 13, 1976 meeting) were approved by the Technical Committee to justify an additional run. The results of this final run will be distributed to all Technical Committee representatives as soon as available (in approximately one week). We request that each Company representative attending the November 17 and 18, 1976 meeting be prepared to vote on the acceptance of the forthcoming computer analysis as the basis for the primary reserves unitization parameter.

Technical Committee
Proposed North Hobbs Unit

Shell Oil Company now feels that they have fulfilled the intent and requirements set forth in our letter dated March 13, 1975 discussing the computer analysis for this field.

Yours very truly,

H. J. Swartz

H. J. Swartz, Chairman

HJS:ELP

#15

MINUTES OF TECHNICAL COMMITTEE MEETING
PROPOSED NORTH HOBBS UNIT
NOVEMBER 17 AND 18, 1976

The meeting was initiated with a brief review of the agenda and in particular the modifications that had been made to the Shell reservoir simulation study of the San Andres reservoirs primary performance. These changes had been requested by the Technical Committee at the November 4, 1976, meeting, are outlined in the minutes, and were at the time intended as the final computer run. The results of this analysis were transmitted to all members with letter dated November 10, 1976.

Shell moved that the results of the reservoir simulation study, summary of equity transmitted to all Operators on November 10, 1976, be used for the San Andres (main zones) tract primary reserve parameter. This motion was seconded by Amoco and the results of the vote were:

FOR (11) : Amerada, Amoco, Chevron (by telegram), Exxon, Getty, Gulf, Mobil, Samedan, Sun, Texas Pacific and Shell.

OPPOSED (3): Cities Service, Conoco and Skelly

The reasons for these objections were discussed and the respective positions are appended as follows: Cities Service (Attachment No. 1), Continental (Attachment No. 2) and Skelly (Attachment No. 3). Shell's response to each of the exceptions is noted at the end of each attachment.

A motion was made by Skelly that their two Turner wells (located in Section 34C and F) be assigned a Zone I primary reserve value of 540,000 barrels each (rather than the 319,000 and 321,000 barrel determination made by the last Shell computer run). All other wells would retain the assigned values shown in this final analysis. Samedan seconded the motion and the resulting vote was as follows:

FOR (2) : Getty and Skelly.

OPPOSED (11): Amerada, Amoco, Cities Service, Continental, Exxon, Gulf Mobil, Samedan, Sun, Texas Pacific and Shell.

A motion was then made by Shell that the Zone I primary oil reserves determined for the two Skelly Turner wells and three directly offsetting wells: Shell Sanger 2(27N), 514,000 barrels; Shell Turner 2(34B), 352,000 barrels; and Shell Turner 1(34G) 576,000 barrels; be arithmetically averaged and the resulting value (approximately 416,400 barrels) be assigned to each of these five wells. No other reserve values would be changed from those determined in the final run. Amoco seconded this motion and the results of the vote were:

FOR (7) : Amerada, Amoco, Gulf, Mobil, Sun, Texas Pacific and Shell

Opposed (4): Cities Service, Conoco, Exxon and Skelly

PASS (2) : Getty and Samedan

Getty requested the inclusion of their comments in the minutes. (See Attachment 4). Mr. W. E. Nolan stated Exxon's preference that no arbitrary adjustments affecting the tract reserve determinations be made.

After additional discussions about alternative proposals to resolve the disagreements (none were finalized as motions), it was decided by the Chairman of the Technical Committee that the results of the "final" Shell reservoir simulation study (first motion) would be submitted to the Working Interest Owners as the San Andres (main zones) primary reserve parameter. This decision was based on the observation that no constructive alternatives had been recommended and whereas it was a controversial determination it had received the most support from the representatives. Furthermore, based on current and prior discussions it appeared that all of the objections were directly related to equity and the disagreements could therefore best be resolved by the Working Interest Owners. The Technical Committee should now continue with their assigned task to determine the economic feasibility of unitized Supplemental Recovery operations and the development of additional parameters. Meanwhile Shell will continue to search for an alternative solution to the primary reserves parameter that would be acceptable to everyone.

The next agenda item was to review primary reserve determinations made from decline curve analyses of those wells producing from the Grayburg and/or upper San Andres stringers. (See minutes of January 13 and 14, 1976, Technical Committee meeting.) The production performance of these wells had been updated to include an additional ten months of history and there were several wells that had not previously been analyzed. Viewgraphs of each updated production performance graph marked with the previously determined initial oil rate (at 1/1/76) and the annual decline rate assigned were shown and reviewed for any necessary adjustments. The results of these evaluations are tabulated in Attachment No. 5. As noted in this summary, twelve revisions were made. Also, seven graphs were classified as erratic performance requiring further analysis and one new lease was added. This tabulation of course represents the current analysis and replaces the summary previously transmitted with the minutes of the January 13 and 14, 1976 Technical Committee meeting.

A description of the problems involved with determining the tract secondary reserve potential for the Grayburg reservoir were presented. The meeting was then adjourned for the day. The Thursday meeting began with a quick review of the results of Shell's reservoir simulation study of the Grayburg waterflood potential. These results had been presented and accepted at the

Technical Committee meeting held on March 25, 1976. That presentation included only the results expected from a five-spot waterflood pattern of the Grayburg formation using the average reservoir characteristics found along the northern and western flanks of the field. Those areas are currently developed by 67 Grayburg wells which can conveniently be converted to an 80-acre five-spot waterflood pattern. Because of the low permeability of the Grayburg net pay it will be necessary to use a pressurized water injection system with an expected surface injection pressure of about 1500 psig. Because of this fact and the small casing sizes it appears impractical to either simultaneously or dually inject water into both the Grayburg and San Andres in the same wellbore. Herein lies the problem. The availability of "Grayburg only" wells will permit the secondary recovery development of about one-half of the original-oil-in-place. The remaining potential is underlain and developed by more prolific San Andres producers. In light of past history it is doubtful that high pressure water injection could be mechanically confined to the Grayburg in most of these wells.

It was decided by the Technical Committee that Shell should make the following determinations:

(1) Quantify the volume of Grayburg reservoir that can be affected by an 80-acre five-spot waterflood pattern with currently available wells. This volume should include the expected encroachment of water beyond the normal well pattern in accordance with a 1955 report by Caudle et al. (See Page 57 of the AIME Monograph Volume 3 by Forrest F. Craig, Jr.)

(2) Evaluate the economic feasibility of drilling Grayburg water injectors but utilizing existing producers for drainage points in the reservoir volume not encompassed in Item 1. This evaluation would also be based on an 80-acre five-spot pattern, upper tier oil price, constant revenue and costs, before federal income taxes, and values discounted at 10 percent and undiscounted. It will be assumed that water injection would be initiated in mid-1979 and the reservoir pressure at that time in this area would be 400 psig.

These determinations should establish what volumes of the Grayburg reservoir can economically be exploited with a waterflood.

Considerable discussion then ensued on the best method to be used in determining the San Andres waterflood potential. Shell had planned to make a reservoir simulation study by modelling the Zone III_L reservoir in its entirety in the northern unit area. Average oil saturations at the start of water injection were to be determined for each floodable zone (II, III_U and III_L) from the recently completed San Andres primary performance simulation study by Shell.

Waterflood recovery would then be evaluated for several cases with different location and number of injectors and producers. However, in view of the previously described controversies about that primary performance simulation study (see Attachments 1, 2, 3 and 4) it was decided that it would be preferable to evaluate the secondary recovery potential of the San Andres by analogy with existing waterfloods in similar reservoirs the West Texas - New Mexico area. Consequently, each representative was requested to supply the Chairman with data on this type of project. However, in order to avoid duplication of effort and incomplete data, Shell will send out a letter requesting specific data from the operator of specific selected projects. Shell will then summarize and average these data and the Technical Committee will then determine the San Andres secondary reserves volumes to be used for the North Hobbs Unit by applying a recovery factor to the OOIP (Zones II, III_L and III_L) for each tract.

It was requested by the Committee that Shell review the computed saturations and reservoir pressures in the latest simulation run to ascertain that significant differences do not exist between grid blocks during mid-1979. Subsequent to the meeting, it was established by Shell that the pressure gradient existing between grid blocks in the North Unit Area averaged 21 psi in Zone II and 16 psi in Zone III and that the saturation differences were not significant for these floodable San Andres zones. The average reservoir pressure in both zones is 580 psig at mid-1979. Shell will continue to design a waterflood plan and present a recommendation to the Technical Committee.

It was estimated that the next meeting would be held in mid-January and be relative to the aforementioned waterflood analyses.

ATTACHMENT NO. 1

OBJECTION BY CITIES SERVICE OIL COMPANY

Cities Service Oil Company believes that the computed San Andres primary reserves for their B. Hardin lease (NW/4 Section 19) are too low and do not properly reflect the remaining value of this lease. This contention is based on the observation that this tract has higher equity values (percent in the proposed North Hobs Unit) in the following parameters: useable wells 2.075%, active wells 1.810%, cumulative oil production (to 1/1/76) 2.079%, current oil production (1st 7 mos. 1976) 1.058%, San Andres OOIP 2.984% whereas the computed primary reserves are equivalent to only 0.693% of the unit total.

SHEL OIL COMPANY RESPONSE TO CITIES SERVICE OIL COMPANY'S OBJECTION

It is recognized that there is a considerable range in the many parameters -- that is the very reason for developing them. The history match for the 4 wells on this lease is quite adequate. One well is now at the economic limit applied to all wells in the simulation (3 BOPD) and is not credited with any reserves. The remaining wells average only 26 B/D oil production by solution gas drive in Zone 3. The predicted reserve of 86,000 barrels per well gives a reserve to production ratio of a reasonable 9.1 years.

ATTACHMENT NO. 2

OBJECTION BY CONTINENTAL OIL COMPANY

Continental Oil Company objects to the use of an arbitrary time cutoff in the reservoir simulation study for determining San Andres primary reserves, which in effect produces some wells to the economic limit while many others are producing at rates above the economic limit at the cutoff date. Continental believes each well should be carried to the economic limit and thereby credited with reserves in a manner consistent with every other well.

SHELL OIL COMPANY'S RESPONSE TO CONTINENTAL OIL COMPANY OBJECTION

Continental Oil Company raises a valid point when they suggest that all wells should be treated alike and be allowed to produce until they reach an economic limit of ? BOPD or 99 percent water cut. However if this is done for this study some of the well lives would probably be extended an additional 50 years or a total future life of about 100 years. Shell feels that it is not realistic to expect this type of well service. The cutoff time chosen (2025.0) is arbitrary and was based on several factors such as: now is mid-point in life, recovery efficiencies are already high, discounted values after 50 years are extremely low, and reservoir pressure at 2025.0 in the depletion drive reservoirs are very low (251 psi in Zone II and 170 psi in Zone III).

ATTACHMENT NO. 5

OBJECTION BY SKELLY OIL COMPANY

Skelly Oil Company does not approve the techniques and mathematical descriptions used for the determination of the San Andres Zone 1 primary reserve parameter. Skelly believes that its B.H. Turner Lease, which has two flowing 80 BOPD and 0 BWPD wells, is not being treated justly. The following is an illustration of this stated inequity using only the comparison of second row San Andres Zone 1 producers:

Operator	Lease & Well No.	Cur. Prod. Rate*	% Wtr. Cut	Zone 1 Rem. Prim. Resr.*
Samedan	Moon "A" #2	64 BOPD & 19 BWPD	23%	475,000 Bbls.
Samedan	Moon "B" #1	67 BOPD & 0 BWPD	0%	656.000 Bbls.
Shell	Sanger #3	80 BOPD & 7 BWPD	8%	638.000 Bbls.
Shell	Sanger #1	80 BOPD & 10 BWPD	11%	513,000 Bbls.
Skelly	Turner #2	80 BOPD & 0 BWPD	0%	319.000 Bbls.
Skelly	Turner #1	80 BOPD & 0 BWPD	0%	320,000 Bbls.
Samedan	Turner"A"#1	50 BOPD & 19 BWPD	28%	460,000 Bbls.
Samedan	Turner"A"#2	57 BOPD & 19 BWPD	25%	495,000 Bbls.
Other Operator's Average Well		66 BOPD & 12 BWPD	15%	540,000 Bbls.
Skelly's Average Well		80 BOPD & 0 BWPD	0%	320,000 Bbls.

Note: The two Seklly wells are the only 80 BOPD, zero water cut, flowing, Zone 1 wells in this portion of the field.
*Based on Aug. Prod. Figures & Shell's Run "C" on the simulator.

A previous indication of this inequity for the Skelly Turner wells was noted in the committee after review of stimulator run "B" which allocated only 403,000 BBLS. per well for Zone 1 remaining primary reserves. At that time the committee agreed to move the two Skelly Turner wells to another grid block in order to obtain better representation of the Skelly Wells. (See Item No. 6 in the minutes of the November 4, 1976 Technical Committee Meeting which was prepared by Shell).

SHELL OIL COMPANY'S RESPONSE TO SKELLY OIL COMPANY OBJECTION

The migration of oil in Zone I has been clearly established as being controlled by edge water encroachment which is from the southwest in the vicinity of the Skelly Turner lease. This natural water influx negates structural advantages and places a premimum on distance from the watered out area, placing the Skelly lease at an unfavorable geographical location. Also the Skelly wells should not be compared to the two Samedan Moon wells which are located 6000 and 4500 feet from the nearest Skelly producer and are affected by different migration characteristics.

It should be noted that Skelly Turner 1 is no longer a top allowable producer. During the first eight months of 1976 this well has produced 88,295 MCF of gas or an overproduction of 19,973 MCF. The well will have to be shut in for 71 days to makeup for the excessive gas and Skelly has advised us that this well also overproduced the gas allowable during September. Clearly a top allowable oil producer, even if it is pumped because it makes some water production, is more desirable than a clean flowing oil well that is GOR penalized. Furthermore, if an adjacent lease is producing water it is indicative that the clean wells will soon produce water if they are opened to production in correlatable zones.

ATTACHMENT NO. 4

COMMENTS BY GETTY OIL COMPANY

Getty Oil Company requests the following comments be included in the minutes of the Technical Committee Meeting of the proposed North Hobbs, Lea County, New Mexico for consideration by the working interest owners' management representatives:

Getty Oil Company believes that numerical reservoir simulation is one of the most valuable tools available in the petroleum industry today for prediction of reservoir behavior. We use this tool often. We recognize both advantages and disadvantages of the tool. We believe that overall Shell Oil has done a good job in the numerical reservoir simulation of the proposed unit. However, some local discrepancies, such as in the area of the Skelly Turner lease, do exist and are not to be unexpected in this particular simulation for the following reasons:

(1) Although a three-dimensional model was used, there are only three layers in the vertical dimension; each representing a completely separate lithologic zone. This is offset to a degree by the use of pseudo relative permeabilities to represent stratification in each of the zones.

(2) A large areal grid size was used. In the majority of the cases, not only are there no grid blocks between wells, there is more than one well in most grids.

(3) Actual data shows that in some cases there are high water producers adjacent to low water or clean producers. Many no-flow boundaries were used during the history match to account for these occurrences.

(4) History matching does not present a unique solution. Even though the simulator accurately performs the calculations of the applicable physical phenomena, the simulator user inputs his own judgement decisions as to modifications of the original input so that computed and actual past performance are as close as practicable.

In summary, Getty Oil Company believes that overall the Shell Oil numerical reservoir simulation provides the best estimates of remaining primary recovery by tracts or wells and fluid saturations for determination of distributions to waterflood recovery. However, for the above stated reasons, the subject simulation results should be tempered by other available data in order to avoid obvious errors such as, but not necessarily restricted to, the area of the Skelly Turner lease.

SHELL OIL COMPANY'S RESPONSE TO GETTY OIL COMPANY COMMENTS

Shell appreciates Getty's concurrence that overall, the simulation provides the best estimates of remaining primary recovery by tracts or wells. As we have emphasized in Committee Meetings, for determination of primary reserves under the conditions which prevail at Hobbs, adequate detail is provided by the model described by Getty under their points 1 to 4. The key features of Hobbs' performance are represented by the use of three distinct zones, 127-acre grid blocks, and flow channels in Zone I (whose boundaries are represented mathematically as no-flow interfaces between certain grid blocks). As Shell stated in these meetings, for other objectives, e.g., to evaluate supplemental recovery by pattern waterflooding, smaller grid blocks would be required. Finally, it is not apparent that there are errors in the area of the Skelly Turner lease. Certainly, the history match obtained on the two Skelly wells and on the offset wells is quite adequate.

Well	Operator		Production Rates Oil B/D	Gas MCF/D	Water B/D	Completion Zones
34C	Skelly	Calc.	79	73	21	1,2
		Actual*	79	85	0	
34F	Skelly	Calc.	80	74	21	1,2
		Actual*	80	310!	0	
34B	Shell	Calc.	80	47	21	1
		Actual*	80	93	13	
34G	Shell	Calc.	80	236	29	1,2
		Actual*	80	87	16	
27N	Shell	Calc.	80	56	21	1,2
		Actual*	80	215	7	

* Arithmetic average of last 12 months of production available (Sept. 1975 thru Aug. 1976).

One possible exception is in the comparison of some calculated and reported gas rates. The simulation does not reflect either the gas rate in Shell's 27N or even higher gas rate in Skelly's 34F (which subjects the latter well to shut-down in the latter part of 1976). Although the net effect upon predicted reserves is somewhat favorable to the Skelly well, we believe that such very localized regions of higher than average gas saturations have only a second order.

Finally, with regard to water rates, on the basis of an examination of the well records of all the wells producing from the several zones in the field, there is little significant distinction between wells making 20 B/D water or less (in this case, between 0 B/D water and 16 B/D).

Notes: * Economic limit assumed to be one BOPD/well.

** New well with erratic production. Reserves are arithmetic average of 4 offset wells (TOPC ST. V AC-1, 2 wells; Amer. St. WNB 1, and Shell State F-3)

*** Add wells recently recompleted; will assign reserves at a later date.

R Revision to prior estimate.
U May change. Update later and review.

#1.

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
January 13, 197-

Thirteen companies, which operate 92 percent of the current producers, were represented. (Attendance list is attached). The main purpose of this meeting was to finalize the tract secondary reserves for the unit.

Discussion was initiated with a brief review of the reservoir simulation study by Shell of the Grayburg waterflood potential. These results had been previously presented to the Technical Committee at a meeting held on March 25, 1976. The main conclusions are:

(1) Because of the low permeability it is necessary to use a pressurized water injection system (1500 psig surface) and a five-spot waterflood pattern.

(2) Primary ultimate recovery efficiency is 18.7 percent and secondary recovery efficiency is 14.4 percent for a symmetrical closed five-spot pattern.

(3) An 80-acre five-spot pattern waterflood, using existing wells, is economically attractive but will have a long life (43 years) and a relatively low response. A complete infill drilling program to obtain 40-acre five-spot patterns cannot be economically justified.

The questions that needed to be resolved at this meeting are:

(1) What reserves should be assigned to the unit to discount the recovery efficiency of 14.4 percent for idealized conditions by the factors of well availability, non-symmetrical five-spots and incomplete patterns? and (2) On what basis should the unit secondary reserves be assigned to each tract?

A study was presented by Shell to show the expected encroachment of injected fluids beyond the normal well pattern (based on studies by Caudle et al, Petroleum Transactions, AIME (1955) 204, 79-85) and reduced sweep efficiencies due to incomplete patterns (based on results published by Craig, AIME Monograph, Volume 3, Chapter 5). The application of these techniques was approved by the Committee and resulted in unit secondary oil reserves of 6,560,000 barrels for a recovery efficiency of 10.6 percent of the OOIP. This is equivalent to a secondary reserve to primary ultimate ratio of 0.57 and requires the drilling of one injector at location 29D. It was decided by the Committee that this volume of secondary reserves should be apportioned to each tract on the basis of the tract OOIP.

It was pointed out that apparently the 320-acre Moranco Rice (Section 13) and Hardin (Sec. 18) leases were experiencing favorable response to Grayburg water injection. The October 1976 oil production from the Hardin tract is 1211 barrels (3 producers) which is the highest production level since 1963. In addition, the GOR has significantly decreased to 2695 cubic feet per barrel oil. Waterflood response from the Rice lease is not as pronounced but still encouraging. Water injection was started in August 1971, but has not been continuous.

At the last Technical Committee meeting it had been decided that San Andres secondary reserves should be determined by analogy with existing San Andres waterfloods in the vicinity that exhibited similar reservoir characteristics. Performance data on 8 such projects were reviewed and averaged a total recovery efficiency of 35 percent with a secondary to primary ratio of 0.85. It was noted that the volumetrically weighted permeability for these projects was 11 millidarcies whereas only two of the projects had average permeabilities as high as the North Hobbs Unit average for Zones II, III_L and III_U (28 millidarcies) and the ultimate recovery efficiency for those two floods are predicted to be 39.4 and 46.4 percent. Their secondary to primary ultimate recovery ratios are 0.43 and 0.66.

A Shell reservoir simulation study of the Zone III_L resulted in a primary recovery efficiency of 24 percent and a secondary recovery efficiency of 20 percent. The ultimate recovery efficiency is 44 percent and a secondary to primary ratio of 0.82. This study assumed a residual oil saturation of 35 percent in the swept zone and the final average saturation of 39 percent is equivalent to a sweep efficiency of 89 percent. It was pointed out that the San Andres Zone III_L is probably the most amenable to waterflooding because of the localized area and shape of the reservoir development.

Based on the foregoing, the Technical Committee determined that the ultimate oil recovery efficiency for the San Andres Zones II, III_U and III_L will be 40 percent. This should result in a secondary reserve for these zones of 48,640,000 barrels of oil. These recoveries are equivalent to an average residual oil saturation of 41.4 percent with a sweep efficiency of 85.1 percent. The ultimate recoveries for each zone in the proposed unit area are summarized in the attached tabulation. The Technical Committee also decided that the secondary reserves for the San Andres should be allocated to each tract on the basis original oil in place for each of the three zones.

Discussion then revolved about the scheduling of future work required for the Technical Committee to complete the charges by the Working Interest Owners. The following tentative schedule was developed: (1) determine the economics of waterflooding of both the Grayburg and San Andres reservoirs, (2) finalize the Grayburg primary reserves, by decline curve analysis, as soon as the production statistics are available through December 1976, and (3) prepare the Technical Committee report (tentatively scheduled for April 1977).

Minutes of the Technical Committee Meeting
Proposed North Hobbs Unit
March 2, 1977

Twelve companies, which operate 83 percent of the current producers, were represented. (Attendance list is attached.) The main objectives of this meeting were to finalize the primary reserve determinations and to review the capital investment requirements and economics of waterflood operations.

The first agenda item was to finalize tract primary reserves for wells producing from the upper San Andres stringers and/or the Grayburg reservoirs. The last estimates had been made on November 11, 1976 and were based on production through August 31, 1976. The production performance graphs have now been updated to include the results through December 31, 1976. The oil reserves for the proposed North Unit area (as of January 1, 1977) were determined to be 1,485,275 barrels and are summarized by tracts on an attachment.

The next agenda item was to determine the method to be used to allocate the oil production from the last four months of 1976 in order to update tract primary reserves computed for wells producing from the main San Andres reservoirs. These reserves have been determined (as of September 1, 1976) with the use of a reservoir simulation program. (Please refer to the minutes of the Technical Committee meeting held on November 17 and 18, 1976.) Two alternatives were considered: 1) Use of computer program predict mode to estimate the zonal allocation of actual production for the last four months of 1976 on a unit basis and determine the tract zonal reserves by applying the same tract percentages previously determined or 2) use the computer program predict mode to estimate the zonal allocation of actual production for the last four months of 1976 on a tract basis and determine the tract zonal reserves by subtracting those values from the previously determined tract reserves (as of September 1, 1976). The latter method was selected; this may result in a slight change in the ratio of tract reserves to unit reserves that were previously furnished to you. Copies of the revised tract values will be mailed to you as soon as available.

A discussion was then initiated about an alternative solution to the computed reserves for the Getty (Skelly) Turner lease located in Section 34. The problem is described in the minutes of the Technical Committee meetings held on November 4, 1976, and November 17 and 18, 1976. The following motion was made by Samedan and seconded by Shell: The Technical Committee accepts the remaining primary oil reserves for the main San Andres zones as determined by the reservoir simulation run of November 8, 1976 (summary of equities transmitted to all Operators with letter dated November 10, 1976) except for a manual adjustment to the zone I primary oil reserves for five direct offset wells (Getty-Skelly Turner 1 (34F) and 2 (34C), Shell Turner 1 (34G) and 2 (34B) and Shell Sanger 2 (27N)) to correct an anomaly in misalignment of the simulator grid in that zone. The remaining zone I primary oil reserves (as of September 1, 1976) for each of those five wells is 416,437 barrels. The results of the vote were:

FOR (10): Amerada, Amoco, Exxon, Getty, Gulf, Mobil, Samedan, Sun, Texas Pacific and Shell
OPPOSED (1): Continental
PASS (1): Cities Service

The primary reserve parameter will therefore reflect this adjustment.

The next agenda item was a review of the economics of secondary recovery operations for this unit. A total capital investment of $24,600,000 will be required to waterflood the Grayburg and San Andres Zones II$_L$, III$_L$, and III$_U$ reservoirs. This amount includes $11,000,000 for centralized production facilities with fourteen satellite stations, $7,000,000 for the injection system and $600,000 for the source water gathering system. The Grayburg flood design is based on an 80 - acre five - spot pattern consisting of 40 injectors and 44 producers. One injector will be drilled. The expected waterflood recovery of 7.6 million barrels (6.6 secondary and 1.0 primary) should be produced in 36 years with a peak production rate of 1298 barrels of oil per day reached after 10 years of water injection. The San Andres flood design is based on a modified nine - spot injection pattern with an approximate spacing of 160 acres and consisting of 27-1/2 injectors (60 well zones) and 116 producers (192 well zones). Five unit producers and 14-1/2 unit injectors will be drilled which includes five (2-1/2 unit) injectors drilled along the common boundary with the Amoco-operated South Hobbs Unit. The expected waterflood recovery of 61.9 million barrels (48.6 secondary and 13.3 primary) should be obtained in 35 years with the peak oil production rate of 9280 barrels of oil per day occurring 8 years after the start of water injection and remaining flat for seven years. The oil and water production rates and volumes and water injection requirements are based on reservoir simulation studies on both the Grayburg and San Andres Zone III$_L$ which have been previously reported. Copies of detailed cost estimates (captial and operating costs) and production functions were handed out to all in attendance and are available on request to those not attending.

The differential profitability analysis for the combined Grayburg - San Andres secondary oil additions of 55.2 million barrels yeild an undeferred before tax profit of $334 million (1359 percent) and a before tax profit, discounted at 10 percent, of $80 million (350 percent) based on constant dollars. Payout occurs in 6 years and the before tax earning power is 28 percent.

#17

SHELL OIL COMPANY

P.O. BOX 991
HOUSTON, TEXAS 77001

March 8, 1977

Subject: Technical Committe Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

Technical Committee
(Addressee List Attached)

Attached are the minutes of the Technical Committee meeting held in Houston on March 2, 1977.

At this session the Technical Committee updated the primary oil reserve determinations to include production through December 31, 1976. In addition it was agreed to make a manual adjustment to the reserves calculated with the reservoir simulation program for five offsetting wells in Section 27 and 34. The Technical Committee also reviewed the estimates of capital investments requirements and the economics of waterflood operations.

This will probably be the final meeting of the Technical Committee prior to the publication of the Report in April. Attached is copy of the Well Status tabulation which has been updated to reflect the conditions as of January 1, 1977. It would be appreciated if each operator would again review this summary and advise me of any errors.

Yours very truly,

H. J. Swartz

H. J. Swartz, Chairman

SHELL OIL COMPANY
PETROLEUM BUILDING
P.O. BOX 1509
MIDLAND, TEXAS 79701

July 20, 1973

Subject: North Hobbs Unit Proposed
Hobbs Field
Lea County, New Mexico

ALL OPERATORS

At the meeting of the Working Interest Owners of the proposed Hobbs (Grayburg-San Andres) Unit held July 12, 1973, it was agreed that efforts would be made to form two Units in the Hobbs Field for purposes of secondary recovery operations instead of one field wide unit previously attempted. It was further agreed that the Hobbs Field would be divided along the Township line between Townships 18S and 19S, R37-38E. Amoco Production Company will be the Unit Expeditor of the area to the south of such line and Shell Oil Company the Unit Expeditor of the area to the north.

A meeting of all Operators of properties to the north of the above stated dividing line is called for 1:30 p.m., July 31, 1973, in the Texas Electric Service Company Reddy Room, 124 North Colorado, Midland, Texas.

The agenda for the meeting will be as follows:

1. Confirm the interest of all Operators of properties to proceed with efforts to unitize and waterflood the properties of the Hobbs Field to the north of the Township line between Townships 18S and 19S, R37 and 38E, Lea County, New Mexico.

2. Discuss plans for further unitization efforts.

3. Organize an Engineering Sub-committee.

4. Develop a charge to the Engineering Sub-committee.

5. Any other business.

This meeting call is being sent only to the Operators of leases, as a list of Working Interest Owners is not as yet available. It is asked that each Operator invite the Working Interest Owners in their properties to attend the meeting if they so desire.

Yours very truly,

W. E. Buck

for Jack L. Mahaffey
Production Manager
Mid-Continent Division

WEB:NO

MINUTES OF OPERATORS MEETING
NORTH HOBBS UNIT PROPOSED
JULY 31, 1973

A meeting of the Operators of the North Hobbs Unit (Proposed) was held July 31, 1973, in Midland, Texas. Representatives attending the meeting are shown on the attached attendance list.

Mr. Buck (Shell) opened the meeting by restating the decisions reached by the Working Interest Owners of the proposed Hobbs (Grayburg-San Andres) Unit at the Operators Committee meeting of July 12, 1973. He pointed out that the purpose of the present meeting was to go further with the above decisions in determining the interest of the Operators in proceeding with unitization and secondary recovery efforts for the area of the Hobbs Field north of the township line between Townships 18S and 19S, R37-38E.

Mr. Buck then asked for comments and discussion concerning such unitization efforts. With the exception of Gulf and without motion, all representatives present agreed to proceed and to participate in an effort to form a North Hobbs Unit with Shell acting as Unit Expeditor. Mr. F. W. Moran (Gulf) then stated that while not opposing unitization, Gulf was concerned that such efforts were somewhat premature and therefore would not actively participate at this time. He further advised that Gulf would cooperate in supplying data and would from time to time review their position for possible change.

With this confirmation of interest, plans for further unitization efforts were discussed. Mr. Buck explained that a complete list of Working Interest Owners had not as yet been developed and asked that if an Operator wished the names of any non-operators be added to the mailing list to please so advise. He also stated that arrangements were being made to obtain all pertinent data from the files maintained by Amoco for the field-wide unitization effort. Mr. Buck submitted a schedule of fixed pre-unit expenses and said a ballot would be submitted for approval.

As a first step toward unitization and waterflooding, the organizing of a Technical Committee and the charge to such Committee was discussed. In answer to Mr. Buck's inquiry the following named companies advised that they would have representatives on the Technical Committee: Exxon, Skelly, Marathon, Continental, Amoco, Cities Service, Texas Pacific, Texaco, Amerada, Getty, Sun, and Chevron.

Mr. Buck then introduced Mr. M. A. Thieme (Shell) who would serve as chairman of the Technical Committee. Mr. Thieme then outlined briefly his plans for the Technical Committee. He advised that it would be the intent of the Committee to use as much data as possible from the study proposed by the Hobbs Unit. However, because of the complexity of the reservoir behavior in the north part of the field, he believed the Technical Committee should make a more detailed study in some instances. Mr. Thieme then submitted a suggested charge for the Technical Committee. After some discussion and modification, the following charge to the Technical Committee was approved by all present:

PROPOSED NORTH HOBBS (GRAYBURG - SAN ANDRES) UNIT

WORKING INTEREST OWNERS' CHARGE TO THE TECHNICAL COMMITTEE

A. Construct an acceptable base map.

B. Define the vertical interval to be unitized.

C. Recommend a Unit Area or areas.

D. Determine feasibility of waterflooding the Grayburg.

1. Construct Grayburg net pay map and (net Øh, if possible).
2. Determine floodable net acre-feet.
3. Determine secondary oil potential.

E. Determine feasibility of waterflooding the San Andres.

1. Review Øh maps.
2. Review GOR and water-cut maps.
3. Construct continuous pay maps by zone.
4. Determine remaining primary production.
5. Establish secondary oil potential by zones.

F. Tabulate the following parameters by tract, by zones, and by Working Interest Owners:

1. Current oil and gas production rate and value for the most recent representative period.
2. Cumulative oil production.
3. Usable completions.
4. Active producing wells.
5. Total acres.
6. Original oil in place.
7. Floodable net acre-feet.
8. Remaining Primary Reserves.
9. Ultimate Primary Oil.
10. Secondary reserves.
11. Any other parameter considered appropriate by the Engineering Subcommittee.

G. Develop recommended plans of depletion including economic comparisons versus continued primary operations.

It was agreed that every effort would be made to obtain general agreement of the Technical Committee on all items. If such agreement could not be reached, it was decided that the Technical Committee would bring such matter to the attention of the Operators Committee for direction or decision. It was further agreed that decisions reached by vote of Technical Committee would be fully recorded in minutes of meetings.

Through further discussion, the opinion was expressed that although it was scheduled for the Technical Committee to complete the charge by July 1974, such Committee should not be bound by this date if it became apparent that additional time would be required to complete an acceptable study. In this regard, Mr. G. R. Meyers (Texas Pacific) pointed out that one of the significant matters to be resolved is the problem of migration and that it might be necessary for Operators to spend money to help delineate and resolve the problem in certain areas of the field.

Mr. Thieme then advised that he would call the first meeting of the Technical Committee during the last part of August.

There being no further business, the meeting was adjourned.

W. E. Buck
Chairman, Operators Committee

BALLOT

Unitization Expense
North Hobbs Unit
Lea County, New Mexico

The undersigned hereby approves the following listed flat rate unitization expenses and agrees to pay a share of such expense; the share being determined by the method stated below:

1.	Drafting, reporduction, assembling and distribution of Engineering Sub-Committee Report and Tabulations such rate not to include special computer studies or laboratory analysis.	$900.00
2.	Printing and assembling Unit Agreements.	$500.00
3.	Appearance before regulatory bodies to obtain approval of the project.	$600.00
4.	Postage, telephone, telegraph and normal and usual expenses of securing joinder. Does not include expenses of personal contacts if travel required exceeds 100 mile radius from Midland, Texas.	$1,000.00
	Total	$3,000.00
5.	Filing and recording fees and associated travel expenses will be considered Unit Expense and charged to the joint account.	

With the formation of the Proposed North Hobbs Unit, all above stated expense items will be shared on the basis of Unit Participation (Phase I). If the Unit does not become effective, then the expense items which have been incurred will be apportioned on the basis of oil produced during the period January 1, 1973 to July 1, 1973. It is understood that any Working Interest Owner may withdraw at any time by giving the Unit Expeditor written notice of such withdrawal, and by paying his share of expenses incurred prior to withdrawal. The withdrawing Owners share shall be determined on the basis of the production period stated above.

TO: ALL WORKING INTEREST OWNERS - PROPOSED NORTH HOBBS UNIT
(MAILING LIST ATTACHED)

As noted from the minutes of the meeting of September 11, 1974, the North Hobbs Engineering Subcommittee has submitted for the decision of the Working Interest Owners the following recommendation:

> "A cut-off date of January 1, 1975 be established for all well logging data and well test information that is to be considered by the Subcommittee in completing the charges given by the Working Interest Owners."

In order for the Engineering Subcommittee to bring certain facets of their work to a conclusion and to proceed with their charge, it is essential that a cut-off date be established. Therefore, the recommendation of the Subcommittee is hereby submitted for your consideration. Please indicate your decision in the space provide below and return one copy to Shell Oil Company, P. O. Box 991, Houston, Texas 77001, Attention Mr. W. E. Buck.

Yours very truly,

W. J. Conrad

Subject: Computer Analysis
Proposed North Hobbs Unit
Hobbs Field
Lea County, New Mexico

OPERATORS - NORTH HOBBS UNIT
(Mailing List Attached)

The Technical Committee of the North Hobbs Unit has recommended that a computer analysis of the San Andres Reservoir be made. The primary objective of such study is to estimate the Zone I primary reserves that would be recovered, by areas, under the conditions of continued water influx and with the current completion status kept constant. The results will serve as a base case for Zone I primary reserves. Future recoveries can then be allocated by the Technical Committee to respective tracts. In addition, the results of such analysis will provide a more complete understanding of the performance of other zones within the San Andres formation.

Shell has agreed to make such an analysis using their three-phase, three-dimensional, compressible fluid reservoir simulation program. Shell's charge for such work shall be $6,000. This flat charge is Shell's estimate of actual computer running time and the associated contract clerical assistance required to assemble data. Shell shall make no charge for technical and non-technical efforts nor for a program licensing fee. A copy of the input data, results obtained, and an explanation of the calculations will be made available to all Operators. The cost of such study ($6,000) will be shared in the manner stated on the attached ballot.

The Technical Committee feels this study is essential to the completion of the charge made by the Operators Committee. Please indicate your decision on the attached ballot and return one signed copy to Shell Oil Company, P. O. Box 991, Houston, Texas 77001, Attention Mr. W. E. Buck.

Yours very truly,

Jack L. Mahaffey
Division Production Manager

BALLOT

Unitization Expense
North Hobbs Unit
Lea County, New Mexico
March 13, 1975

The undersigned hereby approves the following listed flat rate charge for a special computer analysis of the San Andres Formation, which is to be made by Shell, and agrees to pay a share of such expense; the share being determined by the method stated below:

1.	Computer Usage Charge	$ 5,000.00
2.	Associated Contract Clerical Costs	$ 1,000.00
	Total	$ 6,000.00

With the formation of the Proposed North Hobbs Unit, all above stated expense items shall be shared on the basis of Unit Participation (Phase I). If the Unit does not become effective, then the expense items which have been incurred will be apportioned on the basis of oil produced during the period January 1, 1973 to July 1, 1973.

ALL WORKING INTEREST OWNERS - PROPOSED NORTH HOBBS UNIT
(Mailing List Attached).

A meeting of the Working Interest Owners of the proposed North Hobbs Unit is called for 10:00 a.m., May 26, 1977, in the Texas Electric Service Company Reddy Room, 124 North Colorado Street, Midland, Texas.

The agenda for the meeting will be as follows:

1. Formal presentation of the report titled "Waterflood Feasibility and Unitization Parameters", as prepared by the Technical Committee.

2. Consideration of the Report as completing the charge to the Technical Committee.

3. Acceptance of the Report as a basis for Unitization negotiations.

4. Develop a course of action for further unitization efforts.

5. Any other business.

Efforts to unitize and to waterflood the northern part of the Hobbs Field were initiated in July, 1973, when the Operators' Committee charged the Technical Committee to develop a feasibility and parameter study of the area considered for unitization. Due to the different reservoir characteristics evident in the various zones of the Grayburg-San Andres reservoir, it was necessary for the Technical Committe to undertake methods of evaluation not normally required for unitization efforts. Considerable time and expense has been expended in developing the study. With the submittal of the Report to the Working Interest Owners, it appears that a critical point has been reached. All Working Interest Owners are therefore urged to be represented at the called meeting. It is also urged that all representatives attend the meeting prepared to commit their company with regard to the Report and to a course of action for further unitization efforts.

Copies of the Waterflood Feasibility and Unitization Parameters Report for the North Hobbs Unit are transmitted with this call to meeting to all Operators and participants of the Technical Committee as noted on the attached mailing list. Copies will be furnished any other Working Interest Owner upon request.

Yours very truly,

W. E. Buck
Chairman, Working Interest Owners' Committee

OPERATORS - NORTH HOBBS UNIT
(Mailing List Attached)

The proposal for a special computer analysis of the San Andres formation of the North Hobbs Unit has received 88.5% approval of the participating operators with only one recorded dissension. With such response, Shell feels it is in order to proceed with the reservoir simulation study. Pending unitization, Shell will bear the costs to be allocated to the dissenting and non-responding parties.

Subject: Unitization Parameters
Proposed North Hobbs Unit
Hobbs (Grayburg - San Andres) Field
Lea County, New Mexico

All Working Interest Owners
(Addressee List Attached)

Please be advised that the Unitization Parameter Tables (Nos. 21 to 24), which were included in the Technical Committee Report, are being corrected. Revised copies will be distributed at the Working Interest Owners meeting on May 26, 1977 and also transmitted with the minutes of that session.

The following corrections and additions are being made:

1. Working Interest Ownership

   a. Tract No. 50 - Exxon 50%, Cities Service 25%, and Continental 25%

   b. Tract No. 69 - Amoco 75.43501% and Landreth 24.56499%

   c. Tract No. 75 - Marathon 50% and Atlantic Richfield 50%

2. Oil and Gas Production - Year 1976

The prior tabulation was based on the Monthly Statistical Reports. The Annual Report is now available and reflects the following corrections: oil decreased by 207 barrels and gas increased by 7037 MCF. These changes effect the following parameters: Cumulative Oil (Tables 21 A & B), Year 1976 Oil and Gas (Tables 21 A & B) and Ultimate Oil Recovery (Tables 23 A & B). (No corrections were made to oil production during the last four months of 1976 and consequently the Primary Oil Reserves are not affected.)

3. Productive Acres (Tables 22 A & B)

The tabulation included in the Report was based on the productive acres in the Basal Grayburg Upper Zone oil column and omitted the 2174 acres which lie entirely within the gas cap in that particular zone.

4. Gas Reserves

Continental has requested the addition of a parameter for remaining gas reserves. Therefore, such numbers will be added to the revised tables. This parameter will be calculated in the following manner:

a. Grayburg and/or upper San Andres Stringers - The oil reserves listed on Table 14 will be multiplied by the corresponding average GOR for the year 1976, and

b. San Andres (Main Zones) - The "updated" gas reserves will be calculated in a similar manner as shown for the oil reserves in Table 15; that is, the computed 9/1/76 gas reserves (previously furnished to the Technical Committee) will be updated to 1/1/77 values by subtracting the ensuing actual production.

It is requested that any other discrepancies noted be called to the attention of either Mr. W. E. Buck (713-220-1331) or Mr. H. J. Swartz (713-220-1022).

Yours very truly,

W. E. Buck, Chairman
Working Interest Owners' Committee

Subject: Minutes - Working Interest Owners Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

WORKING INTEREST OWNERS - (Mailing List Attached)

A meeting of the Working Interest Owners of the proposed North Hobbs Unit was held May 26, 1977, in Midland, Texas. Representatives attending the meeting are shown on the attached attendance list.

Mr. Buck (Shell) opened the meeting by advising that 90.7 percent of the Working Interest Owners (based on 1976 oil production) were represented at the meeting. He further advised that because of the importance of the meeting, every effort had been made to notify all Working Interest Owners of the meeting. All parties were asked to notify Mr. Buck of any corrections or additions that should be made to the mailing list.

Mr. Buck summarized the previous efforts of unitization in the Hobbs Field. He stated that Amoco initiated an effort in 1970 to form a field wide unit. A feasibility study was completed in March, 1972, and participation negotiations were started. However, it became apparent that agreement could not be reached and in July, 1973, it was decided to divide the Hobbs Field into two parts for unitization and water flooding purposes.

Amoco undertook unitization of the south part of the field and formed the South Hobbs Unit January 1, 1975. Shell acted as Unit Expeditor for the Northern portion of the field. A Technical committee was organized and at a meeting of the Working Interest Owners of the proposed North Hobbs Unit, held July 31, 1973, charged the Technical Committee to develop a waterflood feasibility and unitization parameter study. The Technical Committee has met repeatedly since such date and now have completed and are prepared to submit a report of their study. Mr. Buck pointed out that the attendence and participation of the parties in the Technical Committee was outstanding.

Mr. Buck then turned the meeting over to Mr. H. J. Swartz (Shell), Chairman of the Technical Committee for formal presentation of the "Waterflood Feasibility and Unitization Parameter Report" as prepared by the Technical Committee.

Mr. Swartz started by expressing his appreciation for the excellant cooperation of all parties in the work of the Technical Committee. He stated that the committee held 25 work sessions and that, on the average, 13 operators were represented at each session. He further advised that 22 of the 26 operators had been represented at at least one of the sessions. Mr. Swartz pointed out that it was the aim of the group to reach mutual agreement on all points of the study whenever possible rather than the agreement of only a majority. With only a few exceptions, the group was able to attain this aim.

Mr. Swartz then proceeded to present a summary of the committees work. Salient points of the study were presented with the assistance of projected slides. Several questions were asked and discussed during the presentation. At the end of the presentation Mr. Swartz handed out revised parameter tables which included corrections of production data and ownership. In addition the revised tables included a gas reserve parameter as requested by Continental Oil Company. Copies of revised tables are enclosed with these minutes.

Mr. Buck then asked that the second item of the agenda, completion of the charge of the Working Interest Owners, be considered. After some discussion, Sun Oil Company's representative moved that the report titled "Waterflood Feasibility and Unitization Parameters for the North Hobbs (Grayburg - San Andres) Unit" be accepted as completion of the charge of the Working Interest Owners to the Technical Committee. The motion was seconded by the representative of Amoco Production Company. The motion was passed by the affirmative vote of all present with the qualifications of Continental Oil Company and Exxon Company that their approvals did not include the Gas Reserve Parameter submitted at the meeting as they had not had sufficient time to review such parameter. Marathon Oil Company, passed on the vote at the meeting but advised the chairman of their affirmative vote following the meeting.

Mr. Buck then asked that the third item of the agenda, acceptance of the report as a basis of unitization negotiations, be considered. After discussion, during which Mr. G. R. Meyers, Texas Pacific Oil Company, Inc., expressed concern over some of the relationships, the representative of Amoco Production Company moved that the report be accepted as a basis of unitization negotiations. The motion was seconded by Mobil Oil Company's representative. The motion was approved by the affimative vote of 76.6 percent (1976 production). No negative votes were cast. The affirmative vote of Exxon Company was qualified as to the Gas Reserve Parameter the same as for the previous motion. Continental Oil Company, Russel Estes, and Texas Pacific Oil Company, Inc., passed on the vote on the motion. Mr. Buck asked, and such parties agreed, that he be advised of a decisive vote on the motion at as early a date as possible.

Although a formal vote was not taken, all parties agreed on the basis of the response to the motions to move forward with unitization efforts. After some discussion, it was agreed that a meeting would be called during the first half of July for the purpose of negotiating participation.

In the discussion that followed, some parties expressed concern as to the handling of FEA classified "Stripper" and "Upper Tier" oil after unitization. Mr. Buck advised that it was Shell's general feeling that consideration should be given to parties contributing properties with the more favorable pricing classifications. He further advised that in other unitization efforts provisions had been included in the Unit Agreement rather than in participation negotiations to afford certain considerations to the contributing parties. Upon request, Mr. Buck agreed to include with the minutes of the meeting a provision prepared by Shell for inclusion in other Unit agreements. Such provision is attached hereto. Mr. Buck pointed out that although Shell is in agreement with the general principle of the provision, the submittal of the provision at this time should not be taken as a final Shell proposal in this regard. Shell would want the opportunity to review the problem after participation has been established before making a firm proposal.

Mr. Don Hunter, of Sipes, Williamson & Aycook, Inc., submitted a written proposal on behalf of Moranco for a cooperative waterflood agreement between the North Hobbs Unit and the adjoining Moranco Rice-Hardin Waterflood Unit and the sale of source water from the Moranco water supply system. Mr. Hunter was advised that his proposal would be included in the minutes of the meeting and given consideration by the Working Interest Owners at the appropriate time. The written proposal is included as an attachment to these minutes.

With regard to the water source, Mr. Buck advised that Shell has been negotiating with the city of Hobbs for the purchase of industrial process effluent from its industrial water treatment plant. A draft agreement has been prepared and submitted to the City of Hobbs. At the appropriate time, a negotiated agreement will be submitted to the Working Interest Owners for their consideration.

There being no further business, the meeting was adjourned.

W. E. Buck
Chairman, Working Interest Owners Committee

FEA PRICING

It is anticipated, at the effective date of unitization, crude oil produced, saved and sold from the _____ Unit will be subject to the rules and regulations of the Federal Energy Administration. Such rules provide for the classification of crude oil for pricing purposes as (1) Stripper Well Crude Oil, (2) Old Oil and (3) Upper Tier Crude Oil.

Under the rules and regulations of the Federal Energy Administration as of October 1976, a unit certification is allowed each month to include in the Upper Tier Crude Oil portion thereof, a constant number of barrels described by FEA Regulations as Imputed Upper Tier Crude Oil. The unit certification is further allowed each month to include in the Stripper Well Crude Oil portion thereof, a constant number of barrels described by FEA Regulations as Imputed Stripper Well Crude Oil.

In view of the above, and not withstanding the provisions of Section _____, crude oil produced, saved and sold shall be allocated as follows:

1. Stripper Well Crude Oil - The first oil produced, saved and sold each month up to a quantity equal to the Unit's Imputed Stripper Well Crude Oil shall be allocated to Tracts contributing Imputed Stripper Well Crude Oil to the Unit certification in proportion to their contributions of such Imputed Stripper Well Crude Oil. Should any Tract in any month be allocated out of Unit production in accordance with its Tract Participation as set forth in this Agreement, a total number of barrels of oil that is less than the Imputed Stripper Well Crude Oil that such Tract has contributed to the Unit certification, then such Tract's allocation of

Imputed Stripper Well Crude Oil shall be reduced by the amount that the Imputed Stripper Crude Oil exceeds the amount of oil to be allocated in accordance with its Tract Participation. The amount in excess of its Tract Participation shall be termed Excess Imputed Stripper Well Crude Oil. The total Excess Imputed Stripper Well Crude Oil of all Tracts shall be allocated to all Tracts, including Tracts which have not contributed Imputed Stripper Well Crude Oil to the Unit certification, in proportion to the quantities that the Unit production allocated a Tract by its Tract Participation exceeds the quantity Imputed Stripper Well Crude Oil allocated such tract.

2. Imputed Upper Tier Crude Oil - Oil produced, saved, and sold each month from the Unit after a quantity of oil equal to the Imputed Stripper Well Crude Oil is produced, saved and sold, up to a quantity equal to the Imputed Upper Tier Crude Oil, shall be allocated to those Tracts contributing Imputed Upper Tier Crude Oil to the Unit certification in proportion to their contributions of such Imputed Upper Tier Crude Oil. Should any Tract in any month be allocated out of Unit production in accordance with its Tract Participation, as set forth in this agreement, a total number of barrels that is less than the sum of its Imputed Stripper Well Crude Oil, its Excess Imputed Stripper Well Crude Oil as provided in Paragraph 1 of this Article, and its allocated Imputed Upper Tier Crude Oil, then such Tract's allocation of Imputed Upper Tier Crude Oil shall be reduced by the quantity

that the sum of the Tract's Imputed Stripper Well Crude Oil, its Excess Imputed Stripper Crude Oil and its allocated Imputed Upper Tier Crude Oil exceeds the total quantity of oil to be allocated in accordance with its Tract Participation. The amount in excess of its Tract Participation shall be termed Excess Imputed Upper Tier Crude Oil. The total Excess Imputed Upper Tier Crude Oil of all Tracts shall be allocated to all Tracts including Tracts which have not contributed Imputed Stripper Well Crude Oil and/or Imputed Upper Tier Crude Oil to the Unit certification, in proportion to the quantities that each Tract's allocation of Unit production by its Tract Participation exceeds the sum of the Imputed Stripper Well Crude, Excess Imputed Stripper Well Crude Oil and Imputed Upper Tier Crude Oil allocated such Tract.

3. Upper Tier Crude Oil and Old Oil shall each be allocated to each Tract in proportion to the quantities that each Tract's allocation of Unit Production, in accordance with its Participation, exceeds the sum of the allocated Imputed Stripper Well Crude Oil, Excess Imputed Stripper Well Crude Oil, Imputed Upper Tier Crude Oil and Excess Imputed Upper Tier Crude Oil.

This provision shall remain in effect only so long as necessary for the unit to comply with applicable laws, rules, and regulations of appropriate governmental authorities. Should such laws, rules, and regulations hereafter change substantially so as to alter the basis for a certification of unit production as set forth above, then in such event a method of allocating the certification among the unit ownership shall be implemented by the Unit Operator which as nearly as possible achieves the stated intention

hereof. In any event this provision will automatically terminate in its entirety _____. This provision is deemed supplementary to the other provisions of this Agreement and the provisions of the Unit Operating Agreement so that nothing contained herein shall alter the terms of such agreements, including but not limited to the portions thereof dealing with tract participation, and allocation of unit production, and the allocation of investment and operating costs.

SHELL OIL COMPANY
P.O. BOX 991
HOUSTON, TEXAS 77001

June 29, 1977

Subject: Proposed North Hobbs Unit
Lea County, New Mexico

TO: ALL WORKING INTEREST OWNERS (MAILING LIST ATTACHED)

By letter of June 8, 1977, a meeting of the Working Interest Owners of the proposed North Hobbs Unit was called for July 12, 1977 for the purpose of negotiating unit participation. Realizing the difficulty in evaluating a participation formula when proposed for the first time at a meeting, Shell hereby submits to all Working Interest Owners the participation formula that will be proposed by Shell at such meeting. It is hoped that this early submittal will allow all Parties, especially those basing their decisions on present worth values, the opportunity to complete an evaluation and to make a decisive response at the meeting.

PARTICIPATION FORMULA TO BE PROPOSED BY SHELL OIL COMPANY

Oil Allocation

Phase I - 100 percent oil production for year 1976. Phase I to be in effect until either the oil production from the unit totals 11,670,070 barrels from the effective date of unitization or for a period of 5 years after the effective date of unitization, whichever occurs first. Limiting production is based on Unit becoming effective January 1, 1979 and is the amount of oil estimated by Technical Committee to be produced during first five years of unitized operations. Estimated annual production is shown on attached table.

Phase II -100 percent Primary Oil Reserves (1/1/77). Phase II to be in effect from the end of Phase I to the time the Unit oil production totals the estimated remaining primary reserve of 38,071,683 barrels from January 1, 1977.

Phase III - 100 percent Secondary Oil Reserve to be in effect after the termination of Phase II.

Gas Allocation

Phase I - 100 percent gas production for year 1976. Phase I gas to be same period as Phase I oil.

Phase II- 100 percent Primary Gas Reserve (1/1/77). Phase II gas to be same period as Phase II oil.

Phase III-Allocation to be same as oil and for same period as Phase III oil.

Expense Allocation

1) Operating and Overhead Expense

All such expenses to be allocated on phase-in-effect basis and based on Oil Allocation only.

2) Capital Expenditures

a) All costs of investment nature associated with injection station, injection lines, water source, drilling and equipping injection wells, and conversion expenses be charged initially on the Phase III Oil Allocation basis. From Tables 17, 18 and 19 of Technical Committee Report, such estimated costs would be: Injection System - $7,000,000; Source, $600,000; Drill Injectors, $2,325,000; Equip converted injectors, $988,000; and, Conversion Expense, $1,002,500.

b) All other costs of a capital expenditure type, including tank battery consolidation costs, be allocated initially on the basis of Phase II oil allocation and adjusted to Phase III oil allocation at the termination of Phase II.

3) Inventory

Inventory value to be allocated initially on the basis of Phase II oil allocation and adjusted to Phase III oil allocation at the termination of Phase II.

Yours very truly,

R. L. Howard
Division Production Manager
Mid-Continent Division

Subject: Minutes - Working Interest Owners Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

TO: WORKING INTEREST OWNERS (MAILING LIST ATTACHED)

A meeting of the Working Interest Owners of the proposed North Hobbs Unit was held July 12, 1977, in Midland, Texas. Representatives attending the meeting are shown on the attached attendance list.

Mr. Buck opened the meeting by asking if there were any corrections or additions to the published minutes of the May 26, 1977 meeting. No corrections were submitted and the minutes stand as written.

Mr. Buck then pointed out that at the previous meeting Exxon, Continental Texas Pacific, and Russel Estes, passed on the vote regarding acceptance of the parameter table as a basis for participation negotiations and asked if any of the parties had any change to make in their vote. Exxon changed their vote to yes. Continental sustained the pass vote, stating they were concerned with the shut-in status of some wells during the production period. Texas Pacific retained their pass vote. Estes was not present during the discussion.

Mr. Buck then stated that it was the purpose of the meeting to negotiate a participation formula for Unitization. Before any formula was submitted, Mr. Shepherd, suggested that oil and gas allocation(s) be considered separately from expense allocation(s). After some discussion it was agreed that participation formulas could be proposed with or with out expense considerations.

Mr. Buck then formally proposed the formula previously submitted in writing by Shell. A total of 12 formulas were submitted and considered by the Working Interest Owners. Details of each formula and the resulting vote are shown by attachments hereto.

Prior to submitting Formula No. 12, Mr. Shepherd, Exxon, presented a graph showing the projected performance of the project under unitized operations. He pointed out that under such conditions, an amount of oil equal to the estimated primary reserve would be recovered in less than 1/3 of the time required by non-unitized operations. He also pointed out that with certain formulas, as much as 50 percent of the secondary oil could be produced before secondary parameters become effective. He felt these points should be considered in the development of a participation formula.

As sufficient agreement was not reached on a formula to proceed with other unitization matters, it was agreed to again attempt participation negotiations after all parties had had time to review the negotiations to date.

There being no further business, the meeting was adjourned.

W.E. Buck
Chairman, Working Interest
Owners Committee

Formula No. 1 (Shell)

Oil Allocation

Phase I - 100% Oil Production year 1976 - to be in effect until 11,670, 070 bbls of oil produced after effective date of Unit or 5 years whichever occurs first.

Phase II - 100% Primary Oil Reserve (1/1/77) - to become effective at end of Phase I and to be in effect until production for area equals 38,071,683 bbls from January 1, 1977.

Phase III - 100% Secondary Oil Reserve - to become effective at termination of Phase II.

Gas Allocation

Phase I - 100% Gas Production for year 1976 - Phase I gas to be same period as Phase I Oil.

Phase II - 100% Primary Gas Reserve - Phase II gas to be same period as Phase II Oil.

Phase III - Gas allocation to be same as Oil allocation.

Operating Expenses

Allocation to be on phase-in-effect and based on Oil Allocation only.

Capital Expenditures

(a) All costs of investment nature associated with injection injection station, injection lines, water source, drilling equiping injection wells and conversion expense be charged initially on Phase III Oil Allocation.

(b) All other costs of a capital expenditure type, including tank battery consolidation costs, be allocated initially on Phase II Oil Allocation and adjusted to Phase III Oil Allocation at termination of Phase II.

Inventory

Inventory value to be allocated initially on basis of Phase II. Oil Allocation and adjusted to Phase III Oil Allocation at termination of Phase II.

Formula No. 1 (Shell)

Formula No. 3 (Amerada) Oil and Gas Allocation only - Expense Allocation not included.

Oil

Phase I - To be effective until 38, 071, 683 bbls of oil produced from area after January 1, 1977.
- 1/3 Cumulative Oil Production 1/1/77
- 1/3 Oil Production Year 1976
- 1/3 Remaining Primary Oil Reserve 1/1/77

Phase II - 100% Secondary Oil Reserve

Gas

Phase I - To be same term as Phase I oil
- 100% Remaining Gas Reserve 1/1/77

Phase II - Same as oil allocation.

Voting Results - Based on oil allocation only.

Subject: Formula No. 12 - Correction
Minutes Working Interest Owners Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

To Working Interest Owners

Formula No. 12 as stated in the minutes of the Working Interest Owners Meeting of July 12, 1977 was in error. Attached is a corrected statement of such formula.

W. E. Buck
Chairman, Working Interest Owner
Committee

WEB:CLM

Attachment

Formula No. 12 (Exxon) Oil and Gas Allocation only - Expense Allocation not included.

Oil

Phase I - To be in effect until 11,670,070 barrell of oil produced from area after date of unitization.
- 75% Oil Production Year 1976
- 25% Remaining Primary Oil Reserve (1/1/77)

Phase II - To be in effect at termination of Phase I and until 38,071,683 bbls of oil produced from area after January 1, 1977.
- 75% Remaining Primary Oil Reserve (1/1/77)
- 25% Oil Production year 1976

Phase III - to be in effect at termination of Phase II
- 100% secondary oil reserve

Gas

Phase I - To be in effect during Phase I oil
- 75% Gas Production Year 1976
- 25% Remaining Gas Reserve (1/1/77)

Phase II - To be in effect during Phase II oil
- 75% Remaining Gas Reserve
- 25% Gas Production Year 1976

Phase III - To be in effect during Phase III oil and same as Phase III oil allocation.

Voting Results - Based on oil allocation only.

Lea County, New Mexico

TO: ALL WORKING INTEREST OWNERS - PROPOSED NORTH HOBBS UNIT
(MAILING LIST ATTACHED)

Prior to the meeting of the Working Interest Owners of the proposed North Hobbs Unit of July 12, 1977, Shell submitted a participation formula that was to be formally submitted at the called meeting. The purpose of the early submittal was to allow all Parties the opportunity to complete an evaluation of the formula and to make a decisive response at the meeting. Although the proposed formula did not receive sufficient acceptance to proceed with other unitization matters, we feel the response of the Parties justifies a repeat of the procedure. Shell will, therefore, formally submit the following stated participation formula for the consideration of the Working Interest Owners at the meeting called for September 20, 1977.

Oil Allocation

Phase I - Allocation to be based on two parameters, the proportion of each to be determined as stated below. Parameter "A" to be Oil Production for year 1976 and Parameter "B" to be Remaining Primary Oil Reserves (1/1/77). Phase I to be in effect for a period of 5 years from the effective date of unitization. During the term of Phase I, oil shall be allocated to Tracts in the following manner:

First Year - The first 6500 barrels of oil per day, averaged for a calendar month, produced, saved, and sold from the Unit shall be allocated to Tracts based on Parameter "A". All oil produced, saved, and sold in excess of 6500 barrels per day averaged for a calendar month shall be allocated on the basis of Parameter "B".

Second Year - The first 5200 barrels of oil per day, averaged for a calendar month, produced, saved, and sold from the Unit shall be allocated to Tracts based on Parameter "A". All oil produced, saved, and sold in excess of 5200 barrels per day, averaged for a calendar month, shall be allocated on the basis of Parameter "B".

77

Third Year - The first 3900 barrels of oil per day, averaged for a calendar month, produced, saved, and sold from the Unit shall be allocated to Tracts based on the Parameter "A". All oil produced, saved, and sold in excess of 3900 barrels per day, averaged for a calendar month, shall be allocated on the basis of Parameter "B".

Fourth Year - The first 2600 barrels of oil per day, averaged for a calendar month, and produced, saved, and sold from the Unit shall be allocated to Tracts based on Parameter "A". All oil produced, saved, and sold in excess of 2600 barrels per day, averaged for a calendar month, shall be allocated on the basis of Parameter "B".

Fifth Year - The first 1300 barrels of oil per day, averaged for a calendar month, produced, saved, and sold from the Unit shall be allocated to Tracts based on Parameter "A". All oil produced, saved, and sold in excess of 1300 barrels per day, averaged for a calendar month, shall be allocated on the basis of Parameter "B".

Phase II - 100 percent Remaining Primary Oil Reserves (1/1/77). Phase II to be in effect from the end of Phase I to the time the oil production from the Unit Area totals the estimated Remaining Primary Oil Reserve of 38,071,683 barrels from January 1, 1977.

Phase III - 100 percent Secondary Oil Reserve. Phase III to be in effect after the termination of Phase II.

Gas Allocation

Phase I - 100 percent Gas Production for Year 1976. Phase I gas to be same period as Phase I oil.

Phase II - 100 percent Primary Gas Reserve (1/1/77). Phase II gas to be same period as Phase II oil.

Phase III - Allocation to be same as oil and for same period as Phase III oil.

The limiting average of daily production of 6500 barrels as used during the first year of Phase 1 is the projected daily production of the Unit Area for the year 1979. It will be noted from the attached production function forecast for unitized operations that the unit production would start to exceed the limiting production during the second year of unitized operations.

R. L. Howard

78

RE: North Hobbs (Grayburg-San Andres)
Proposed Unit
Lea County, New Mexico

2 WEB
10

Shell Oil Company
P. O. Box 991
Houston, Texas 77001

Attention: Mr. W. E. Buck

Gentlemen:

A review of the Shell minutes for the May 26 and July 12, 1977, meetings of the working interest owners in the proposed subject unit reflect that (1) the technical report titled "Waterflood Feasibility and Unitization Parameters for the North Hobbs (Grayburg-San Andres) Unit" has been basically accepted by the working interest owners, and (2) that most of these owners have appeared willing to use, along with an initial period of "current production", the "primary" and "secondary" reserves in the negotiation proceedings thus far. However, no resolution has been made as to the timing of distribution of these "primary" and "secondary" reserves in the formulas considered. The Shell formula presented for consideration in its August 29, 1977 letter likewise does not address this timing factor.

The attached graph "Performance Forecast - Proposed North Hobbs Unit" shows a consolidation for all zones of the "primary" and "secondary" reserves included in the technical report and assumes unitization will be effective January 1, 1979. This chart was shown by Exxon and discussed at the last meeting. The included table gives the technical committee data from which the graph is constructed. As indicated, the committee forecasts secondary oil will be first recovered after some 6.4 million barrels have been produced, followed then by varying ratios of primary and secondary oil production for the life of the project. Exxon believes this projection should be considered in the development of a participation formula for the proposed unit and to such end will introduce the following formula at the called September 20 working interest owner's meeting.

A DIVISION OF EXXON CORPORATION

	Oil Reserve	
	Primary MMB	Secondary MMB
Phase 1 for 6.4 MMB after 1-1-79		
100% Current Oil Production	6.4	
Phase 2 for the next 26.7 MMB (Cumulative 33.1 MMB)		
44.6% Primary Reserves	11.9	
55.4% Secondary Reserves		14.8
Phase 3 for remainder (Estimated 55.2 MMB)		
26.8% Primary Reserves	14.8	
73.2% Secondary Reserves		40.4
Total Primary and Secondary	33.1	55.2

During Phase I and Phase II gas parameters would be substituted in the above formula for allocation of gas production.

Very truly yours,

J. M. Shepherd

FROM TECHNICAL COMMITTEE REPORT

SHELL OIL COMPANY

P.O. BOX 991
HOUSTON, TEXAS 77001

September 23, 1977

Subject: Minutes - Working Interest Owners' Meeting
Proposed North Hobbs Unit
Lea County, New Mexico

TO: WORKING INTEREST OWNERS (MAILING LIST ATTACHED)

A meeting of the Working Interest Owners of the proposed North Hobbs Unit was held September 20, 1977 in Midland, Texas. Representatives attending the meeting are shown on the attached attendance list.

Mr. Buck opened the meeting by advising that Mr. H. J. Swartz, Shell representative on and Chairman of the Technical Committee, had been given a new assignment and would be replaced by Mr. W. R. Lancaster. Mr. Buck then stated that the purpose of the meeting was to negotiate a participation formula for unitization. It was pointed out that participation formulas had been submitted by letter by Shell and Exxon prior to the meeting, and these formulas would be considered first.

A total of 5 formulas were submitted and considered by the Working Interest Owners. Details of each formula and the resulting votes are shown by attachments hereto.

Prior to consideration of Formula No. 14 (Exxon), Mr. Buck stated that it was Shell's feeling that the Shell formula (13) and the Exxon formula (14) offered two different approaches to unitization. He pointed out that Shell's formula offered certain benefits for the remaining primary reserve; whereas, the Exxon formula did not appear to provide appreciable benefits to the primary reserve. Mr. Shepherd, Exxon, again pointed out that the projected performance of the unit indicated that a major portion of the secondary oil would be recovered prior to recovery of the estimated primary reserve and felt that the formula submitted by Exxon recognized this and took it into account.

Before considering Formula No. 16 (Texas-Pacific), Mr. Lyons (Continental) questioned whether the 1976 Oil Production parameter reflected the relationship existing among individual properties. He further advised that Continental believed such parameter, if used, should be given only minimum weight.

As shown by the voting results, Formula No. 17 (Continental) received in excess of 80 percent approval of the Working Interest Owners in attendance. It was therefore agreed to submit Formula No. 17 for a ballot vote to all Working interest Owners.

Formula No. 17, as proposed by Continental, applied only to the allocation of oil and gas production. A brief discussion then followed as to the method of allocating expenses. Although a method of allocation was not formally submitted or voted on, it was generally agreed that a ballot vote would be submitted on the following method of allocating expenses.

Operating & Overhead Expenses

All Operating, Maintenance and Overhead expenses to be borne by Working Interest Owners in proportion to their phase-in-effect Unit Oil Participation.

Capital Expenditures and Inventory

All expenditures of a capital nature and the inventoried value of personal property to be borne initially on the basis of the Phase II Oil Participation and adjusted to Phase III Oil Participation at the termination of Phase II.

Shell, as Unit Expeditor, agreed to submit for ballot vote, Participation Formula No. 17 and the above-stated method of allocating costs.

It was agreed, without vote, that Shell would proceed to develop drafts of the Unit and Unit Operating Agreements for submittal to all Working Interest Owners.

There being no further business, the meeting was adjourned.

Attached for your convenience is a tabulation of gas participation under Formula No. 17.

W. E. Buck
Chairman, Working Interest
Owners' Committee

Attachments

Formula No. 13 (Shell, Oil and Gas Allocation only - Expense Allocation not included.

Oil Allocation

Phase I - Allocation to be based on two parameters, the proportion of each to be determined as stated below. Parameter "A" to be Oil Production for year 1976 and Parameter "B" to be Remaining Primary Oil Reserves (1/1/77). Phase I to be in effect for a period of 5 years from the effective date of unitization. During the term of Phase I, oil shall be allocated to Tracts in the following manner:

First Year - The first 6500 barrels of oil per day, averaged for a calendar month, produced, saved, and sold from the Unit shall be allocated to Tracts based on Parameter "A". All oil produced, saved, and sold in excess of 6500 barrels per day averaged for a calendar month, shall be allocated on the basis of Parameter "B".

Second Year- The first 5200 barrels of oil per day, averaged for a calendar month, produced, saved, and sold from the Unit shall be allocated to Tracts based on Parameter "A". All oil produced, saved, and sold in excess of 5200 barrels per day, averaged for a calendar month, shall be allocated on the basis of Parameter "B".

Third Year- The first 3900 barrels of oil per day, averaged for a calendar month, produced, saved, and sold from the Unit shall be allocated to Tracts based on the Parameter "A". All oil produced, saved, and sold in excess of 3900 barrels per day, averaged for a calendar month, shall be allocated on the basis of Parameter "B".

Fourth Year- The first 2600 barrels of oil per day, averaged for a calendar month, and produced, saved, and sold from the Unit shall be allocated to Tracts based on Parameter "A". All oil produced, saved, and sold in excess of 2600 barrels per day, averaged for a calendar month, shall be allocated on the basis of Parameter "B"

Fifth Year- The first 1300 barrels of oil per day, averaged for a calendar month, produced, saved, and sold from the Unit shall be allocated to Tracts based on Parameter "A". All oil produced, saved, and sold in excess of 1300 barrels per day, averaged for a calendar month, shall be allocated on the basis of Parameter "B".

Oil Allocation

Phase II - 100 percent Remaining Primary Oil Reserves (1/1/77). Phase II to be in effect from the end of Phase I to the time the oil production from the Unit Area totals the estimated Remaining Primary Oil Reserve of 38,071,683 barrels from January 1, 1977.

Phase III - 100 percent Secondary Oil Reserve. Phase III to be in effect after the termination of Phase II.

Gas Allocation

Phase I - 100 percent Gas Production for Year 1976. Phase I gas to be same period as Phase I oil.

Phase II - 100 percent Primary Gas Reserve (1/1/77). Phase II gas to be same period as Phase II oil.

Phase III - Allocation to be same as oil and for same period as Phase II oil.

Voting Results - Based on oil allocation only.

Formula No. 14 (Exxon) Oil and Gas Allocation only - Expense Allocation not included.

Oil Allocation

Phase I - 100% 1976 Oil Production. To be in effect until 6,400,000 barrels of oil product from Unit Area after effective date of unitization (Est. 1/1/79).

Phase II- 44.6% Remaining Primary Reserves 1/1/77 plus 55.4% Secondary Reserves to be in effect at the termination of Phase I and until 26,700,000 barrels of oil have been produced from the Unit Area after termination of Phase I.

Phase III-26.8% Remaining Primary Reserves 1/1/77 plus 73.2% Secondary Reserves to be in effect from the termination of Phase II until termination of the Unit.

Gas Allocation

Phase I - 100% 1976 Gas Production. Effective period to be same as Phase I oil above.

Phase II- 44.6% Remaining Gas Reserves 1/1/77 plus 55.4% Secondary Oil Reserve. Effective period to be same as Phase II oil above.

Phase III-Same as Phase III oil allocation.

Voting Results - Based on oil allocation only.

Subject: Proposed Participation Formula
North Hobbs Unit
Lea County, New Mexico

TO: ALL WORKING INTEREST OWNERS (MAILING LIST ATTACHED)

At the Working Interest Owners Meeting of the proposed North Hobbs Unit of September 20, 1977, it was agreed to submit for ballot vote the Participation Formula No. 17 and a method of allocating costs. In accordance with such agreement, the ballots are hereby submitted for the two items in reference. Please indicate your decision on these matters in the spaces provided and return one copy of each to Shell Oil Company, Box 991, Houston, Texas 77001, attention W. E. Buck.

Enclosed for your convenience is a self-addressed, stamped envelope.

PROPOSED NORTH HOBBS UNIT

PARTICIPATION FORMULA NO. 17 (CONTINENTAL)

Oil Allocation

Phase I - 20% 1976 Oil Production plus 80% Remaining Primary Oil Reserve (1/1/77) - to be in effect until the total oil production from the Unit totals 4,000,000 barrels of oil after the effective date of unitization.

Phase II- 100% Primary Oil Reserve (1/1/77) - to become effective at the end of Phase I and to be in effect until production from the Unit Area equals 38,071,683 barrels of oil after January 1, 1977.

Phase III-100% Secondary Oil Reserve - to become effective at termination of Phase II and to remain in effect until termination of the Unit.

Gas Allocation

Phase I - 20% 1976 Gas Production plus 80% Remaining Primary Gas Reserves (1/1/77). Phase I gas to be the same period as Phase I oil.

Phase II- 100% Primary Gas Reserve (1/1/77) - Phase II gas to be the same period as Phase II Oil.

Phase III-Gas allocation to be the same as oil allocation.

The undersigned votes as noted below in regard to Participation Formula No. 17 (Continental):

Re: Proposed Method of Allocating
Operating Cost, Inventory Value
and Capital Expenditure

Ladies and Gentlemen:

A Letter Ballot submitted September 23, 1977, by Shell Oil Company recommended a basis by which Operating Costs, Inventory Value and Capital Expenditures should be allocated to Joint Account. Shell's proposal apportions an unfair share of the inventory value and capital expenditures to the primary oil phase (Phase II) resulting in a disproportionate financial burden on those Working Interest Owners having a low ratio of Phase III to Phase II participation. Approximately 59 percent of the Working Interest Owners (Formula No. 17) have a lesser Phase III participation than Phase II.

Assuming the proposed waterflood responds as predicted, the remaining primary recovery will be accelerated, increasing the present value of these reserves. However, the Unit is being formed primarily for the recovery of secondary oil, and considerable expenditure is required to accomplish this process.

Therefore, we wish to propose the method of allocating Unit costs outlined on the attached Letter Ballot for your consideration. This method does not overburden Phase II but apportions the expenditures to the phases in a more equitable manner.

Please indicate your approval of the attached Letter Ballot and submit it to:

Shell Oil Company
P. O. Box 991
Houston, Texas 77001
Attn: W. E. [illegible]

Very truly yours,

Boyce Parry

LETTER BALLOT

PROPOSED NORTH HOWE UNIT

METHOD OF ALLOCATING COSTS

(Samedan Oil Corporation)

I. Operating Expenses

1. Operating, Maintenance and Overhead expenses incurred in the production, handling and treating of oil and gas shall be charged on the basis of the phase-in-effect oil participation.

2. Operating, Maintenance and Overhead expenses pertaining to the supply of make-up water, injection of water and all injection facilities, including the injection wells, shall be charged on the basis of 33⅓% Phase II Oil Participation plus 67% Phase III Oil Participation during the Phase I and Phase II periods.

   All the above charges shall be made on the basis of Phase III Oil Participation during the Phase III period.

II. Inventoried Value of Personal Property - Capital Expenditures

1. The inventoried value of personal property shall be made on the basis of 33⅓% Phase II Oil Participation plus 67% Phase III Oil Participation with such value, corrected for retirements, to be adjusted on the basis of Phase III Oil Participation within a reasonable time following the effective date of the Phase III period.

2. All expenditures of a capital nature shall be made on the basis of 33⅓% Phase II Oil Participation plus 67% Phase III Oil Participation during the Phase I and Phase II periods.

   All the above expenditures, corrected for retirements, shall be adjusted on the basis of Phase III Oil Participation within a reasonable time after the effective date of the Phase III period.

3. All expenditures of a capital nature made during the Phase III period shall be charged to the joint account on the basis of Phase III Oil Participation.

Subject: Ballot Results -- Participation Formula and Cost Allocation Formula
North Hobbs (Grayburg-San Andres) Unit
Lea County, New Mexico

TO: WORKING INTEREST OWNERS (Mailing List Attached)

By letter of September 23, 1977, ballots were submitted to the Working Interest Owners of the proposed North Hobbs (Grayburg-San Andres) Unit concerning a participation formula and a cost allocation formula. Tabulated below are the results of the ballots returned as of this date. The percentages shown are the Working Interest Owners' participation based on Formula 17 (Oil Allocation).

Participation Formula (No. 17)

	Working Interest Owners' %	
	Approved	Disapproved
Phase I	92.01237	1.46358
Phase II	92.58657	1.30069
Phase III	89.76525	1.27189

Cost Allocation

	Working Interest Owners'%	
	Approved	Disapproved
Phase I	78.13850	15.05034
Phase II	78.33749	15.33648
Phase III	85.16566	5.76775

Following are the results received to date on the cost allocation formula submitted by Samedan Oil Corporation.

Cost Allocation (Samedan)

	Working Interest Owners'%	
	Approved	Disapproved
Phase I	9.07946	30.19928
Phase II	9.53079	29.52246
Phase III	1.72004	28.39264

Shell is currently preparing drafts of the Unit and Unit Operating Agreements and will submit such drafts for your consideration in the near future.

Attached for your consideration and use is a tabulation showing the tract interest and tract participation of each Working Interest Owner as calculated from Participation Formula No. 17. Also attached is a summary tabulation showing the unit participation of each Working Interest Owner as calculated from Participation Formula No. 17.

In the near future you will receive a letter from Shell's Land Department requesting confirmation of Working Interests and other data required for the various exhibits that will be included in the Unit and Unit Operating Agreements. Please give such request your earliest consideration so that all the data will be available when needed for preparation of the Agreements in final form.

Yours very truly,

R L Howard

Subject: North Hobbs (Grayburg - San Andres) Unit
Lea County, New Mexico

TO: ALL WORKING INTEREST OWNERS
NORTH HOBBS (GRAYBURG - SAN ANDRES) UNIT
(Mailing List Attached)

A meeting of the Working Interest Owners of the proposed North Hobbs (Grayburg - San Andres) Unit is called for 10:00 A.M. February 2, 1978 in the Midland Room, Midland National Bank, Midland, Texas.

The agenda for the meeting will be as follows:

1. Review drafts of Unit and Unit Operating Agreements.
2. Develop course of action for further unitization efforts.
3. Any other business.

Attached for your review are copies of proposed Unit and Unit Operating Agreements. Exhibits pertaining to tract and unit participation have not been included as current division of interests are not yet available. Tabulations showing the interests as now available have been attached and the exhibits will be prepared as soon as the data is complete.

We would appreciate any written comments prior to the meeting and asked that all parties attend the meeting prepared to render decisions regarding the various provisions of the agreements.

Response to date on the ballots submitted September 23, 1977 is as follows:

Participation Formula (No. 17)

	Working Interest Owners' %	
	Approved	Disapproved
Phase I	92.04485	1.46358
Phase II	92.62039	1.30069
Phase III	89.76789	1.27189

Cost Allocation

	Working Interest Owners' %	
	Approved	Disapproved
Phase I	78.13850	15.08282
Phase II	78.33749	15.37030
Phase III	85.16566	5.77039

Cost Allocation (Samedon)

	Working Interest Owners' %	
	Approved	Disapproved
Phase I	9.18740	36.47405
Phase II	9.59976	35.82007
Phase III	1.73943	38.79959

Yours very truly,

W. E. Buck
Chairman, Working Interest
Owners' Committee

Working Interest Owners
Proposed North Hobbs Unit
Lea County, New Mexico

Re: Method of Allocating
Operating Costs, Inventory
Value and Capital Expenditure

Ladies and Gentlemen:

Proceedings toward unitization of the North Hobbs Field have resulted in two proposals of methods by which to make charges to the various Tracts within the proposed Unit, such charges pertaining to Operating Costs, Inventory Adjustment and Capital Expenditures.

Shell Oil Company presented a method September 23, 1977, which recommends charging operating costs on the basis of the oil participation phase-in-effect and allocating inventory adjustment and capital expenditures on the basis of 100% Remaining Primary Oil Reserves (Phase II), with readjustment to occur at the beginning of Phase III (100% Secondary Oil Reserve Parameter).

Samedan Oil Corporation proposed a second method for allocating the above charges on October ?, 1977. Samedan contended at the time of their proposal that Shell's recommendation was disproportionately weighted on the remaining primary oil reserves. Samedan's proposal tended to make charges using a combination of Remaining Primary Oil Reserves (Phase II) and Secondary Oil Reserves (Phase III), thereby allocating costs more fairly and more commensurate with the purpose of forming the Unit.

Shell Oil Company has scheduled a Working Interest Owners Meeting on February 2, 1978, at Midland, Texas. In preparation for this meeting, Samedan has conducted an in-depth study of the different proposals for allocating costs, and by this letter we intend to show the inequitable, high development costs incurred by Shell's proposal for those Tracts having a high remaining primary oil parameter and a low secondary oil parameter.

The proposed North Hobbs Unit incorporates basically three distinct types of oil producing Tracts:

(1) Some 31 of the 83 Tracts produce only from the Grayburg zone and have no remaining primary reserves in the San Andres formation.

The current producing rate of these Tracts places them in a "stripper" status, or essentially a depleted state. Conversely, all of these Tracts have secondary reserves. Three of these leases have no current production and no remaining primary reserves, but do have secondary reserves. Tracts having only Grayburg reserves are paying a low development cost for secondary reserves during the early phases of the Unit.

(2) Tracts having San Andres II, San Andres III Upper and San Andres III Lower have a higher producing rate than those having Grayburg only, and consequently, also have a higher remaining primary reserve position. These San Andres zones also are given secondary oil reserves, which brings the Phase II (Remaining Primary Oil) and Phase III (Secondary Oil) parameters closer together. However, these zones are pressure depleting, having a solution gas drive mechanism.

(3) The third category of producing properties includes those Tracts which produce almost entirely from the San Andres I zone, which has no secondary reserves due to the active water-drive reservoir mechanism. There are 17 Tracts which have 70% or more of their remaining primary reserves in the San Andres I zone, but have little or no secondary reserves. There are 6 Tracts which receive 100% of the remaining reserves from the San Andres I zone and have relatively small secondary reserves.

This third category is paying an unfairly high development cost for its negligible secondary reserves during the initial stage of the operations.

Below is a tabulation of all Samedan operated leases showing a comparison of investment and discounted net cash flow before Federal Income Taxes. The assumption is made that a basic 1/8 Royalty Interest exists and that the bulk of the investment or development capital expenditures will be made during the first three years of operations.

Tract No.	Lease Name	Remaining Primary Oil Zone	Development Cost Per Secondary Bbl.		Discounted Primary Phase Income @ 10%	
			Shell Proposal	Samedan Proposal	Shell Proposal (M$)	Samedan Proposal (M$)
32	State 'C'	San Andres I	$ 0.92	$ 0.55	$2,746	$3,135
[illegible]	State 'B'	Grayburg	$ 0.09	$ 0.29	$ 56	$ 46
41	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
55	Moon 'A'	S.A. I, S.A. II	$ 3.90	$ 1.58	$2,335	$2,702
56	Moon 'B'	S.A. I, S.A. II	$ 8.54	$ 3.13	$ 289	$ 351
64	Turner 'B'	San Andres I	$ 8.93	$ 3.16	$ 383	$ 419
65	Turner 'B-2'	San Andres I	[illegible]	[illegible]	[illegible]	[illegible]
66	Turner 'A'	San Andres I	$ 2.41	$ 1.13	$2,285	$2,646

The above clearly shows the wide range of development costs as they apply from lease to lease, but more significantly, the figures show that Tracts having a high remaining primary position, mainly because of the San Andres I

zone, and a low secondary reserves position are paying for a large share of the development costs which are being made for secondary oil recovery. The principle is totally unacceptable to Samedan.

We believe water injection will enhance the recovery of remaining primary reserves, and consequently, the primary phase should incur a portion of the development costs. However, the Unit is being formed for the recovery of secondary reserves, and the secondary phase is obligated to share its portion of the development costs. Even though an adjustment of the costs are to be made at the beginning of Phase III, there is no assurance that the operations will reach the Phase III period. Should Phase III not become effective, development costs administered against the high percentage remaining primary-low percentage secondary participants will not be recovered. Further, the excessive early high costs charged against the Tracts with a high remaining primary position, requires those Tracts to sustain an unfavorable present value position by, in effect, loaning money to the Tracts having a low remaining primary - high secondary position for the duration of the primary phase. Such loan made today, and repaid at the beginning of Phase III, has little present worth.

Due to the extreme difference in the present worth value of the primary phase Tract income, between Shell's proposal and Samedan's proposal, as a percent of the total primary phase Tract net income, Samedan must take the strong position of refusing to become a part of the North Hobbs Unit should Shell's proposal be adopted. Further, we have an obligation to our joint interest owners to make them aware of this unfair basis of administering expenses. Should Shell's proposal be made a part of the Unit Operating Agreement, Samedan will resort to any available legal means to prevent its enactment.

We request that the agenda for the meeting scheduled for February 2, 1978, be modified to permit renegotiation of a method for allocating costs. This request is in the interest of permitting continued progress toward unitization.

Very truly yours,

SAMEDAN OIL CORPORATION

January 24, 1978

Subject: North Hobbs (Grayburg San Andres) Unit
Lea County, New Mexico

TO: ALL WORKING INTEREST OWNERS

By letter of January 16, 1978, Samedan Oil Corporation advised that they considered the cost allocation formula as balloted by letter of September 23, 1977, inequitable. Samedan further requested by their letter that negotiation of a cost allocation formula be included on the agenda for the Working Interest Owners meeting called for February 2, 1978. In view of Samedan's request and as it was agreed at the previous Working Interest Owners meeting that the cost allocation formula would be considered at the time the draft agreements were reviewed, the stated agenda of the meeting called for February 2, 1978, is hereby amended to include consideration of a cost allocation formula.

Shell does not agree that the comparisons set forth by Samedan are acceptable criteria for determining equity. However, Shell has reviewed the effects of both the Samedan and Shell formulas and is concerned that either of the two formulas might result in the secondary recovery project yielding a less-than-acceptable investment opportunity for certain parties. This situation results from the extreme variation in participation of tracts from the primary to secondary phase.

In an effort to evaluate the effect of the two cost formulas, Shell developed a comparison of the incremental present value profit for each tract. Incremental profit as used in the analysis, is the difference between the present value profit to be derived from unit operations (recovery of primary plus secondary oil) and the present value profit resulting from non-unit (primary oil and gas only) operations of any given tract. A discount factor of 10 percent was used in all cases and only the before tax profit was calculated. The production rates and capital and operating cost estimates as developed by the Technical Committee and presented in the "Waterflood Feasibility Study" were used in the evaluation.

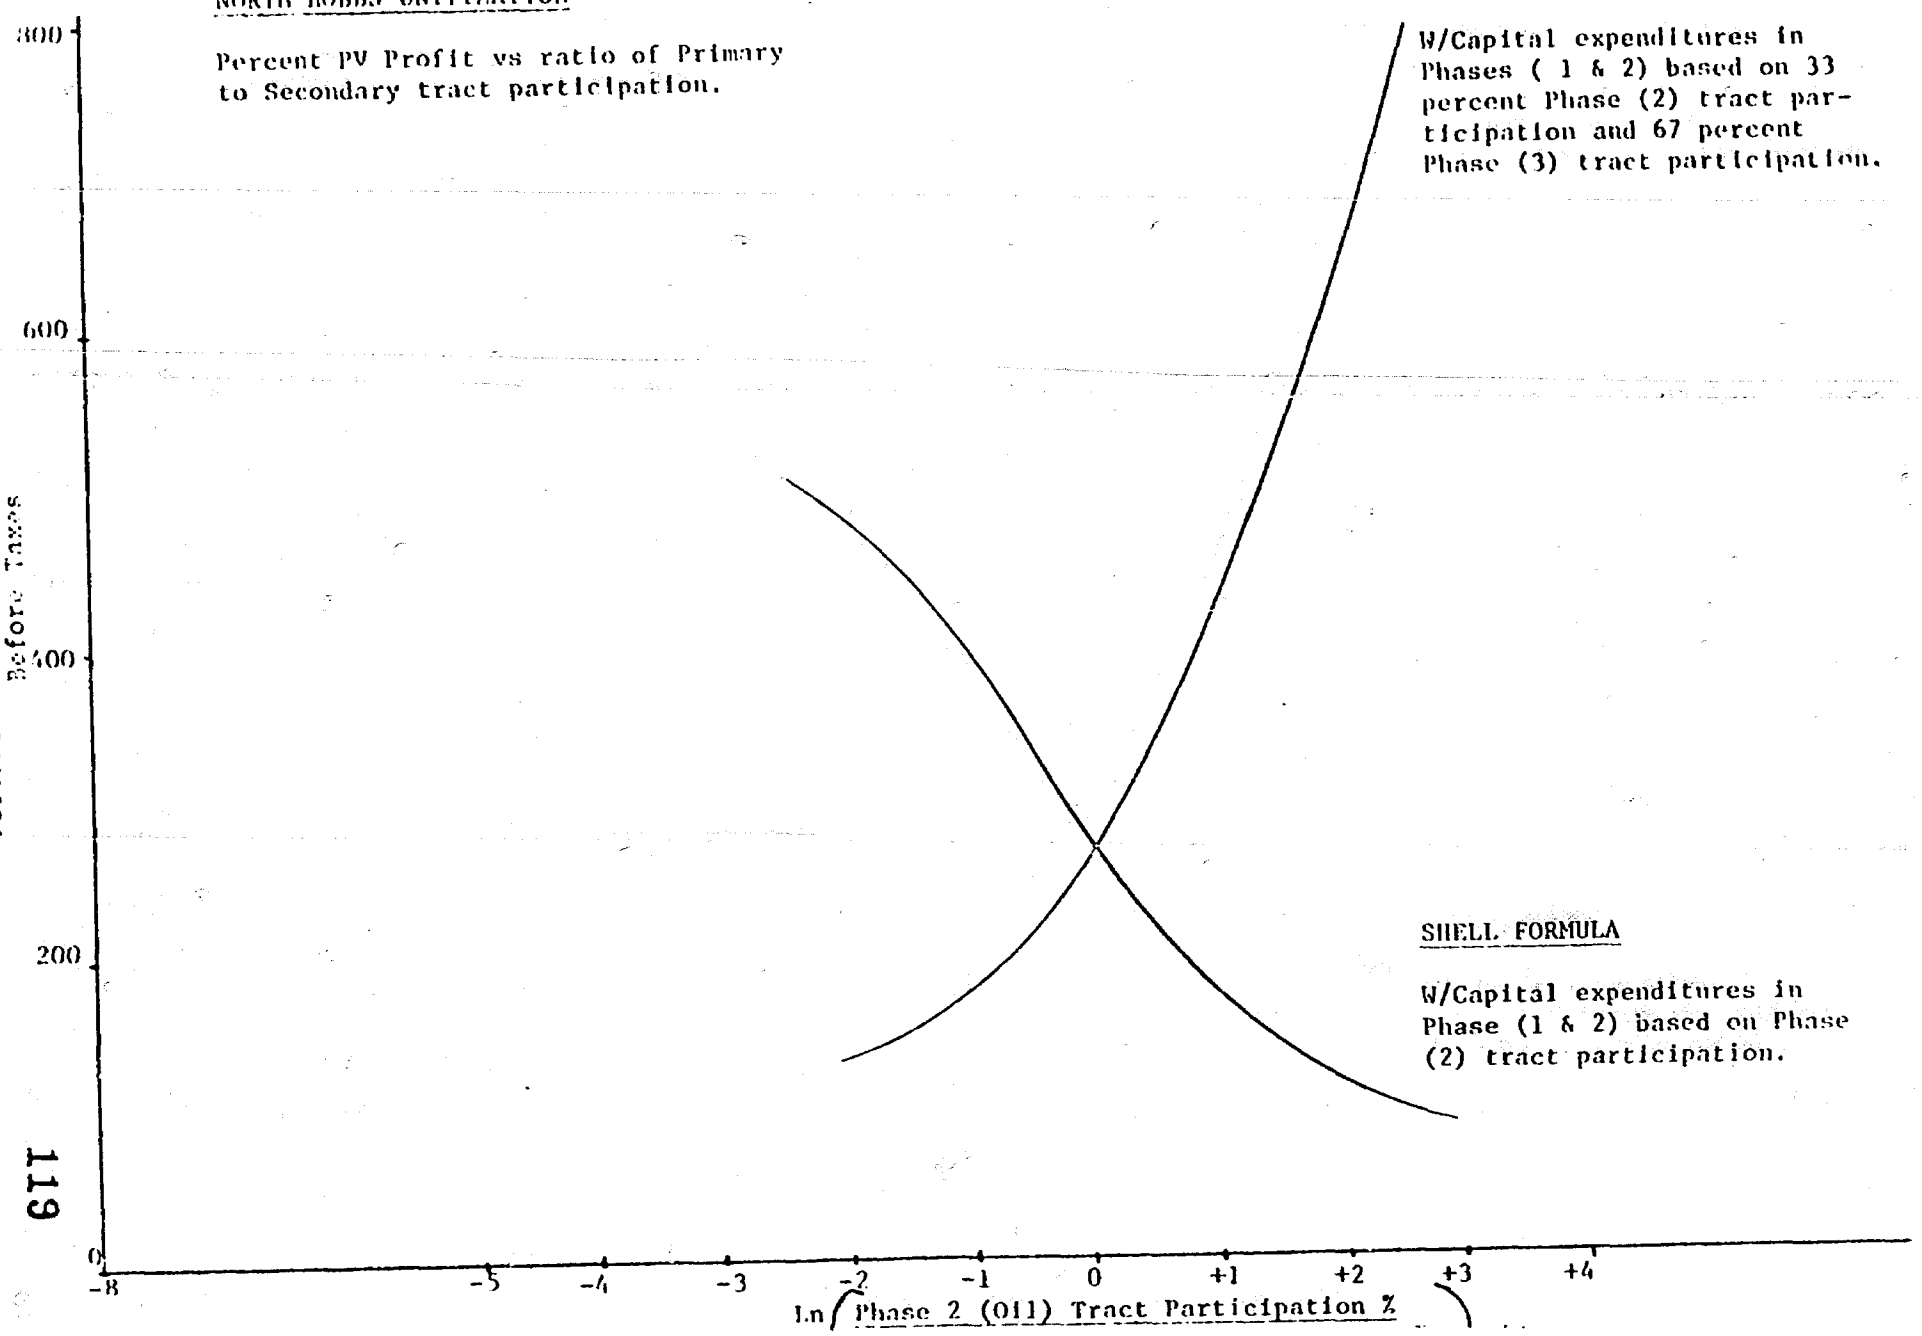
The attached graph shows the results of Shell's review. The percent incremental present value profit (incremental present value profit divided by present value capital for each tract) was plotted against the ratio of each tract's primary participation percentage to its secondary participation. To facilitate computer plotting, the natural logarithm of the ratio was used. The results indicate that by using the Samedan formula, the tracts having a high ratio (high primary and relatively low secondary participation) would yield a very favorable return on the capital investment; whereas, the tracts with a low ratio (low primary and relatively high secondary) would yield a low return on investment. With the Shell formula, the reverse is true. Tracts with a high ratio would yield a low

return on investment and tracts with a relatively low ratio would enjoy a high return on investment.

It is recognized that the method of evaluation does not result in absolute values for each tract. However, it is felt that the method offers a realistic means of comparing the trends of the cost allocation formulas and that such trends should be considered in developing an acceptable formula.

Based on the above comparisons, it is Shell's feeling that further consideration should be given to negotiating a cost allocation formula which would provide for a unitized operation that would yield acceptable investment opportunities to all parties. It is, therefore, asked that all Working Interest Owners attend the meeting of February 2, 1978, prepared to render a decision regarding a method of allocating unit costs.

Yours very truly,



For: R. L. Howard

February 8, 1978

Subject: Minutes - Working Interest Owners' Meeting
Proposed North Hobbs (Grayburg-San Andres) Un
Lea County, New New Mexico

TO: WORKING INTEREST OWNERS (Mailing List Attached)

A meeting of the Working Interest Owners of the proposed North Hobbs (Grayburg-San Andres) Unit was held February 2, 1978 in Midland, Texas. Representatives attending the meeting are shown on the attached attendance list.

Mr. Buck opened the meeting by stating that at the meeting of September 23, 1977, general agreement was reached on an oil and gas allocation formula. Mr. Buck stated that it was also agreed at such meeting for Shell to submit ballots on the oil and gas allocation formula and a cost allocation formula. In addition, Shell was to develop drafts of Unit and Unit Operating Agreements and to submitt such drafts to the Working Interest Owners for review. Mr. Buck advised that the draft agreements had been completed and were submitted with the call to meeting.

Mr. Buck then advised that the results of the ballots on the oil and gas allocation formula were as follows:

	Working Interest Owners' % (Oil Only)	
	Approved	Disapproved
Phase I	92.04485	1.46358
Phase II	92.62039	1.30069
Phase III	89.76789	1.27189

Response to date on the cost allocation formula is as follows:

	Working Interest Owners' % (Oil Only)	
	Approved	Disapproved
Phase I	82.82611	15.0828
Phase II	82.73358	15.37030
Phase III	92.80451	5.77039

Mr. Buck then stated that Samedan Oil Corporation submitted a cost allocation formula in writing to all Working Interest Owners and requested a ballot vote. The ballot response to such formula was as follows:

Working Interest Owners' % (Oil Only)

	Approved*	Disapproved
Phase I	13.86912	36.47405
Phase II	14.30357	35.82007
Phase III	4.55875	38.79959

*Includes Texas Pacific approval stated at meeting.

Mr. Buck went on to advise that the program of unitization and water injection has been submitted to the Commissioner of Public Land, State of New Mexico and to the United States Department of Interior, Geological Survey. Although neither agency has given any written response, Mr. Buck felt from the discussions at the presentations that the program was favorably received by both.

Mr. Buck advised that a review of the division of interests received to date indicated a diversity of working interests above and below 4500 feet in a number of leases. In view of this, it is believed that the base of the unitized formation (Section 2 (h), Unit Agreement) should be defined as the depth of 4500 feet beneath the surface. The depth of 4500 feet is approximately 200 feet below the established water level in the San Andres formation.

Mr. Buck pointed out that some parties advised in writing of their objections to the cost allocation formula and that they would object to an effort to form a unit on such basis under the New Mexico Unitization Statute. In view of this, Mr. Buck felt the Working Interest Owners should decide whether to proceed with unitization efforts based on the cost allocation formula which has an indicated acceptance by more than 75 percent of the Working Interests or to attempt to develop another formula that would receive greater acceptance. It was noted that the Working Interests approving both the participation formula and the Shell cost allocation formula, and which could, therefore, be anticipated to ratify a unit agreement, total 78 percent for each Phase I and Phase II and 85 percent for Phase III. The meeting was then opened for discussion.

Mr. Joe Thorton, Sun Production Company, advised that Sun would oppose an effort to form the unit under the New Mexico Unitization Statute. Mr. Thornton stated that such opposition was not on a matter of equity but as a matter of principle. Sun did not feel the New Mexico Oil Conservation Commission had the authority to act in this particular instance.

Mr. Boyce Perry, Samedan, stated they would oppose unitization if based on present cost allocation formula and that they felt the formula proposed by Samedan was more in keeping with the benefits to be derived from the project. Mr. John Cusack, Cusack interests, advised that he would not accept the formula as presented and favored the one submitted by Samedan. After more discussion in which some parties indicated a preference to proceed with the formula which has received in excess of 75% approval, Mr. Boyce Perry, Samedan, moved that an effort be made to negotiate a cost allocation which would be acceptable to a greater number of the Working Interest Owners. The motion was seconded by Mr. Cusack, Cusack Interests. Voting results were as follows:

	Working Interest Owners' % (Oil Only)		
	For	Against	Pass
Phase I	75.23913	21.67889	0.22719
Phase II	76.07912	21.12195	0.19658
Phase III	62.00388	34.33593	0.43429
	97.14531	97.39765	96.77410

The motion was considered passed and the meeting was opened for suggested cost allocation formulas.

Mr. Boyce Perry, Samedan, requested that the formula submitted in writing be again submitted for vote. The formula was as follows:

I. Operating Expenses

1. Operating, Maintenance and Overhead expenses incurred in the production, handling and treating of oil and gas shall be charged on the basis of the phase-in-effect oil participation.

2. Operating, Maintenance and Overhead expenses pertaining to the supply of make-up water, injection of water and all injection facilities, including the injection wells, shall be charged on the basis of 33% Phase II Oil Participation plus 67% Phase III Oil Participation during the Phase I and Phase II periods.

   All the above charges shall be made on the basis of Phase III Oil Participation during the Phase III period.

II. Inventoried Value of personal Property - Capital Expenditures

1. The inventoried value of personal property shall be made on the basis of 33% Phase II Oil Participation plus 67% Phase III Oil Participation with such value, corrected for retirements, to be adjusted on the basis of Phase III Oil Participation within a reasonable time following the effective date of the Phase III period.

2. All expenditures of a capital nature shall be made on the basis of 33% Phase II Oil Participation plus 67% Phase III Oil Participation during the Phase I and Phase II periods.

3. All the above expenditures, corrected for retirements, shall be adjusted on the basis of Phase III Oil Participation within a reasonable time after the effective date of the Phase III period.

4. All expenditures of a capital nature made during the Phase III period shall be charged to the joint account on the basis of Phase III Oil Participation.

Details of the voting are shown on Attachment No. I and the summary results were as follows:

	Working Interest Owners' % (Oil Only)		
	For	Against	Pass
Phase I	18.42891	78.48903	
Phase II	18.99331	78.17770	
Phase III	8.11158	88.18190	
.33 Phase II + .67 Phase III	11.70255	83.82857	

Mr. R. W. Mullins, Amerada-Hess Corporation, proposed that the Samedan formula be used, only that no adjustment in the investment account be made at the termination of Phase II (Oil). Details of the voting are shown on Attachment No. 2 and summary results were as follows:

	Working Interest Owners' % (Oil Only)		
	For	Against	Pass
Phase I	6.56696	79.03633	11.54184
Phase II	6.56261	78.89605	11.96893
Phase III	8.60241	73.91749	14.81957
.33 Phase II + .67 Phase III			

Mr. O. V. Stuckey, Getty Oil Company, proposed that all capital expenditures during Phase I and Phase II be allocated on 2/3 Phase II Interest (Oil) plus 1/3 Phase III Interest (Oil) and adjusted to Phase III at termination of Phase II (Oil). Operating expenses were to be based on phase-in-effect. Details of the voting are shown on Attachment No. 3, and the summary results were as follows:

	Working Interest Owners' % (Oil Only)		
	For	Against	Pass
Phase I	59.97659	36.94135	
Phase II	60.40459	36.76642	
Phase III	56.81526	39.47822	
2/3 Phase II + 1/3 Phase III	59.20220	37.66659	

Mr. Boyce Perry, proposed that all capital expenditures be allocated on 1/3 Phase II (oil) + 2/3 Phase III (oil) during Phase I and II and adjusted to Phase III interests at termination of Phase II (Oil). Operating costs to be based on phase-in-effect. Details of the vote are shown on Attachment No. 4 and the summary results were as follows:

	Working Interest Owners' % (Oil)		
	For	Against	Pass
Phase I	18.42891	78.48903	
Phase II	18.99331	78.17770	
Phase III	8.11158	88.18190	
1/3 Phase II + 2/3 Phase III	11.73764	84.83270	

Mr. Thane Aikens, Arco, proposed that all capital expenditures during Phase I (Oil) and Phase II (Oil) be allocated on .50 Phase II (Oil) plus .50 Phase III (Oil) interest and adjusted to Phase III (Oil) at termination of Phase II. All operating expenses to be allocated on phase-in-effect. Details of the vote are shown on Attachment No. 5 and summary results were as follows:

	Working Interest Owners' % (Oil)		
	For	Against	Pass
Phase I	78.27269	18.64525	
Phase II	78.88410	18.28691	
Phase III	68.56783	27.72595	
.5 Phase II + .5 Phase III	73.72588	23.00645	

Mr. Buck, Shell, proposed a compromise of two previous proposals, (Getty and Arco). Such proposal was that all capital expenditures during Phase I (Oil) and Phase II (Oil) be allocated on 58 percent Phase II (Oil) interest and 42 percent Phase III (Oil) interest and adjusted to Phase III (Oil) at termination of Phase II (Oil). Operating expenses to be allocated on basis of phase-in-effect. Details of the vote are shown on Attachment No. 6 and summary results are as follows:

	Working Interest Owners' % (Oil Only)		
	For	Against	Pass
Phase I	82.01563	10.87691	2.63643
Phase II	82.36473	10.72944	2.71879
Phase III	76.86992	13.50522	4.03993
.58 Phase II + .42 Phase III	80.05693	11.89528	2.27367

In view of the favorable response to the last cost formula submitted by Shell, it was agreed to submit the formula for ballot vote. It was understood that all votes were cast subject to management approval.

Time did not permit review of the Unit and Unit Operating Agreements and Mr. Buck advised that a meeting would be called at a later date for such purpose. Comments regarding the agreements have been received from two parties. Based on the comments, Shell proposed certain changes or additions. A list of the changes were given to the Working Interest Owners present and a copy is attached to the minutes.

Mr. Shepherd, Exxon, asked for an explanation of the limiting quantity of 23,000,000 barrels of oil stated in Article 16 (c) of the Unit Agreement. Mr. Buck advised that based on the projected primary performance of the Unit, it was estimated that, without water injection, the unit production would average 10 barrels of oil per day per well after the production of 23,000,000 barrels from January 1, 1979. As all production would qualify as stripper for FEA pricing purposes at such time and under such conditions, it was suggested that this amount be used as the limiting quantity of oil.

All parties who had not done so, were ask to submit as soon as possible the division of interests for their properties in order that the necessary exhibits for the agreements could be completed.

There being no further business, the meeting was adjourned.

Yours very truly,

W. E. Buck
Chairman, Working Interest Owners Committee

PROPOSED CHANGES IN UNIT AGREEMENT
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT

Page 3: In subsection (h), delete "and 5347 feet" and add at the end "and the depth of 4500 feet beneath the surface".

Page 9: In the third paragraph of Section 12, delete "owner" and insert "party or parties entitled thereto".

Page 10: At the end of the next to last paragraph in Section 13 add:

"Unit Operator shall notify the Supervisor and the Land Commissioner as to the date each phase change occurs".

Page 19: At the end of the first paragraph in Section 24 add:

"Unit Operator shall not file this Agreement or notice thereof for record, and hence this Agreement shall not become effective, unless such filing is approved by Working Interest Owners owning a combined Phase III Unit Participation of at least eighty percent (80%) as to all Tracts then committed to this Agreement".

Page 24: In the fifth line of the first paragraph of Section 39 after "become parties to this Agreement" insert "or have approved this Agreement in writing".

Page 25: At the end of the first paragraph in the revised Section 24 add:

"Unit Operator shall not file this Agreement or notice thereof for record, and hence this Agreement shall not become effective, unless within ninety (90) days after the date all other prerequisites for effectiveness of this Agreement have been satisfied, such filing is approved by Working Interest Owners owning a combined Phase III Unit Participation of at least sixty-five percent (65%) as to all Tracts within the Unit Area.

Subject: Proposed Cost Allocation Formula
North Hobbs (Grayburg - San Andres) Unit
Lea County, New Mexico

TO: ALL WORKING INTEREST OWNERS

At the Working Interest Owners Meeting of the proposed North Hobbs (Grayburg - San Andres) Unit of February 2, 1978, it was agreed to submit for ballot vote a method of allocating unit costs as proposed by Shell Oil Company. Accordingly, a ballot is hereby submitted for such method of allocating unit costs. Please indicate your decision on this matter in the space provided and return one copy to Shell Oil Company, Box 991, Houston, Texas 77001, Attention W. E. Buck.

Enclosed for your convenience is a self-addressed, stamped envelope.

Yours very truly,

W E Buck

W. E. Buck
Chairman, Working Interest Owners Comm

NORTH HOBBS (GRAYBURG - SAN ANDRES) UNIT
COST ALLOCATION FORMULA - PROPOSED BY SHELL AT
MEETING OF FEBRUARY 2, 1978

I. Operating Expenses

Operating, maintenance, and overhead expenses to be allocated on phase-in-effect unit participation (oil).

II. Capital Expenditures and Inventoried Value of Personal Property

1. The inventoried value of personal property and all expenditures of a capital nature (including injection well conversion costs) made during Phase I (oil) and Phase II (oil) will be allocated on the basis of .58 Phase II (oil) participation plus .42 Phase III (oil) participation.

2. At the termination of Phase II (oil), the inventoried value of personal property and the capital investment account (both adjusted for retirements and including conversion costs) shall be adjusted to Phase III (oil) participation.

3. All expenditures of a capital nature made during Phase III will be allocated on the basis of Phase III (oil) participation.

The undersigned votes as noted below in regard to the above stated cost allocation formula.

Approved _____ Company _____

Disapproved _____ Representative _____

SHELL OIL COMPANY

P.O. BOX 991
HOUSTON, TEXAS 77001

May 3, 1978

Subject: North Hobbs (Grayburg - San Andres) Unit
Lea County, New Mexico

TO: Working Interest Owners
(Mailing List Attached)

A meeting of the working interest owners of the proposed North Hobbs (Grayburg-San Andres) Unit is called for 10:00 A.M., May 18, 1978, in the Reddy Room, Texas Electric Service Company, Midland, Texas.

The agenda for the meeting will be as follows:

1. Review drafts of Unit and Unit Operating Agreements with view to preparing agreements in final form and submitting to working and royalty interests for ratification.

2. Develop further course of action for unitization matters.

3. Any other business

The indicated response to date on the ballot submitted February 9, 1978, is as follows:

Investment Participation

	Working Interest Owners' Participation %	
	Approved	Disapproved
Phase I Oil (Unit Participation)	85.33638	10.18781
Phase II Oil (Unit Participation)	85.79607	9.70702
Phase III Oil (Unit Participation)	83.62214	14.55282
Investment Participation	84.88304	11.74226

(Detailed response is shown on attached tabulation)

The response shown includes, as approved, the indicated acceptance of Samedan Oil Corporation. Samedan has advised that they will accept the formula with the added provision that the investment account be re-adjusted to Phase III Oil Unit Participation at the termination of Phase II (production of 38,071,683 bbls oil after 1/1/77) or at January 1, 1991, which ever occurs first. The date,

January 1, 1991, is the first day of the year following the approximate date that oil production from the unit area after January 1, 1977, totals 38,071,683 barrels as determined from the unit production performance estimated by the Technical Committee. As this is in keeping with the intent and purpose of the proposed formula for investment expenditures, the draft of the Unit Operating Agreement has been revised to include such stipulation.

All working interests owners, who have now indicated acceptance of the cost allocation formula, have previously indicated acceptance also of the gas and oil participation formulas. Shell considers this response sufficient to proceed with finalization of the Unit and Unit Operating Agreements and to submit such agreements for ratification at the earliest possible date.

Drafts of the Unit and Unit Operating agreements were submitted with the call to meeting of December 14, 1977. Due to further negotiation of the cost allocation formula, the drafts were not reviewed at the meeting of February 2, 1978. In the interim, written comments have been received from a number of the working interest owners. The comments have been reviewed and the revisions suggested by Shell are attached. All comments will be discussed at the meeting and representatives are asked to attend the meeting prepared to render decisions concerning the agreements.

A current listing of all working interest owners has been made and, as there have been changes in ownership, a new tabulation showing unit participation (oil and gas) and investment participation (based on .58 -.42 formula) is being prepared. Such tabulation will be mailed to you as soon as completed.

Yours very truly,

W E Buck

W. E. Buck
Chairman, Working Interest Owners
Committee

PROPOSED CHANGES IN UNIT AGREEMENT
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT

Page 3: In subsection (h), delete "and 5347 feet" and add at the end "and the depth of 4500 feet beneath the surface".

Page 9: In the 5th line of the 1st paragraph in Section 12, after "water" insert "injection plants", and in the next line after "injection" insert "plants".

Page 9: In the 3rd paragraph in Section 12, delete "owner" and insert "party or parties entitled thereto".

Page 10: At the end of the next to last paragraph in Section 13 add:

"Unit Operator shall notify the Supervisor and the Land Commissioner as to the date each phase change occurs".

Page 15: At the end of the 3rd sentence in the last paragraph in Section 16, change the period to a semicolon and add "thereafter all oil produced, saved and sold from the unit shall, as to each and every category into which such production may then or thereafter be classified for pricing or other purposes, be allocated to all qualified Tracts in proportion to Tract Participation in accordance with the provisions of Section 15".

Page 16: At the beginning of Section 18, delete "The State of New Mexico and United States of America and" and insert "Any and".

Page 19: In the 10th and 14th lines in Section 23, change "instrument or transfer" to "instrument of transfer" and delete the comma in the 14th line.

Page 19: At the end of the 1st paragraph in Section 24 add:

"Unit Operator shall not file this Agreement or notice thereof for record, and hence this Agreement shall not become effective, unless such filing is approved by Working Interest Owners owning a combined Phase III Unit Participation of at least eighty percent (80%) as to all Tracts then qualified under the provisions of Section 14".

Page 21: At the beginning of Section 27 insert "Unless a different representative is designated by Working Interest Owners,".

Page 22: In the 8th line in Section 32 change "interested subject thereto" to "interest subject hereto".

PROPOSED CHANGES IN UNIT AGREEMENT
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT

Page 24: In the 5th line of the 1st paragraph in Section 39 after "become parties to this Agreement" insert "or have approved this Agreement in writing".

Page 25: At the end of the 1st paragraph in the revised Section 24 add:

"Unit Operator shall not file this Agreement or notice thereof for record, and hence this Agreement shall not become effective, unless within ninety (90) days after the date all other prerequisites for effectiveness of this Agreement have been satisfied, such filing is approved by Working Interest Owners owning a combined Phase III Unit Participation of at least sixty-five percent (65%) as to all Tracts within the Unit Area.

PROPOSED CHANGES IN UNIT OPERATING AGREEMENT
NORTH HOBBS (GRAYBURG-SAN ANDRES) UNIT

Page 1: Add a section in Article I as follows:

"1.2 Additional Definitions. For the purposes of this agreement, the following terms and expressions as used herein shall mean:

(a) "Investment Participation" shall mean the sum of .58 Phase II Unit Participation and .42 Phase III Unit Participation.

(b) "Investment Readjustment Date" shall mean the date of termination of Phase II or January 1, 1991, whichever is the earlier date."

Page 1: Change the first sentence in Section 2.1.2 to read "Exhibit E, attached hereto, is a schedule showing the Tract Participation, the Unit Participation, and the Investment Participation of each Working Interest Owner."

Page 6: After the 1st sentence in Section 7.9 insert "Unit Operator shall furnish to a Working Interest Owner, upon written request, a copy of each authority for expenditure prepared by Unit Operator for its own use."

Page 8: In the 7th line of Section 10.3.1 change "Phase II Unit Participation" to "Investment Participation".

Page 9: Make the following changes in Section 10.3.2:

Beginning in the 1st line in the 1st paragraph, change "as of the end of Phase II" to "as of the Investment Adjustment Date".

Beginning in the 8th line in the 1st paragraph change "during Phase I and Phase II Unit Operations" to "prior to the Investment Readjustment Date".

Beginning in the 2nd line in paragraph (b) change "during Phase I and Phase II Unit Operations" to "prior to the Investment Readjustment Date".

Beginning in the 2nd line in paragraph (c) change "prior to the effective date of Phase III Unit Operations" to "prior to the Investment Readjustment Date".

Page 9: Delete the last sentence in Section 10.4.

PROPOSED CHANGES IN UNIT OPERATING AGREEMENT
NORTH HOBBS (GRAYBURG-SAN ANDRES UNIT)

Page 10: Make the following changes in Section 10.5:

In the 5th line change "Phase II Unit Participation" to "Investment Participation."

Beginning in the 5th line change "as and while Phase I and Phase II may be effective" to "during the time prior to the Investment Readjustment Date".

In the 7th line change "from and after the time Phase III may hereafter become effective" to "from and after the Investment Readjustment Date."

Page 10: Change Section 11.1.2 to read as follows:

"11.1.2. Investment Cost. The cost of investment items (as described in Section 10.3.2 (b) above) incurred prior to the Investment Readjustment Date shall be shared and borne by Working Interest Owners in proportion to Investment Participation. The cost of such investment iters incurred after the Investment Readjustment Date shall be shared and borne by Working Interest Owners in proportion to Phase III Unit Participation."

Page 12: In the 4th line from the top of the page after "collected from" insert "or otherwise received for the account of".

Page 16: In the 10th line of Section 18.1, after "Working Interest Owners" insert "without regard to plugging and abandonment costs".

Page 17: In the 4th line of Section 20.1.2, after "Working Interest Owners" insert "without regard to plugging and abandonment costs".

Subject: Participation and Cost Allocation Tabulations
North Hobbs (Grayburg-San Andres) Unit
Lea County, New Mexico

To: Working Interest Owners - North Hobbs
(Grayburg - San Andres) Unit
(Mailing List Attached)

The call to meeting of May 3, 1978, advised that up-dated tabulations of all working interest owners and their respective unit and investment participation would be furnished as soon as completed. Attached are the following listed tabulations:

1. Tract participation and Investment Participation.

2. Tract Participation and Investment Participation - by tract and working interest in each tract.

3. Unit Participation and Investment Participation - by working interest owner and by tract.

4. Summary of Unit and Investment Participation.

The data shown will be used in preparing the exhibits to the unit and unit operating agreements. It is, therefore, requested that if any errors are noted, Shell be so advised as soon as possible.

Since the call to meeting was issued, Cities Service has indicated acceptance of the cost allocation formula. The current response concerning the investment allocation, including the acceptance of Cities Service, is as follows:

Investment Participation

	Working Interest Owners' Participation %	
	Approved	Disapproved
Phase I Oil (Unit Participation)	88.58519	6.93900
Phase II Oil (Unit Participation)	88.99853	6.50456

Investment Participation

	Working Interest Owners' Participation %	
	Approved	Disapproved
Phase III Oil (Unit Participation)	89.16650	9.00846
Investment Participation	89.06910	7.5562

Yours very truly,

W. E. Buck
Chairman, Working Interest Owners Committee

SHELL OIL COMPANY

P.O. BOX 991
HOUSTON, TEXAS 77001
JUN - 2 1978

Subject: Minutes - Working Interest Owners' Meeting
of May 18, 1978
Proposed North Hobbs (Grayburg - San Andres)Unit
Lea County, New Mexico

TO: WORKING INTEREST OWNERS
(Mailing List Attached)

A meeting of the Working interest Owners of the proposed North Hobbs (Grayburg-San Andres) Unit was held May 18, 1978 in Midland, Texas. The representatives attending the meeting are shown on the attached attendance list.

Mr. Buck, chairman, opened the meeting by stating that the cost allocation formula submitted for ballot consideration by letter of February 9, 1978, had been accepted by Working Interest Owners totaling approximately 89 percent based on the oil unit participation. He further advised that all parties indicating acceptance of the cost allocation formula had also previously indicated acceptance of the unit participation (oil & gas) formula. He stated that Shell, as Unit Expeditor, believed the affirmative response was sufficient to proceed with the development and the submittal for execution of the unit and unit operating agreements.

Mr. Buck pointed out that drafts of the unit and unit operating agreements had been submitted to the Working Interest Owners with the notice of the meeting of February 2, 1978. Comments from a number of Working Interest Owners have been received and reviewed by Shell. Revisions, suggested by Shell and resulting from the comments received, were attached to the notice of this meeting.

As the first agenda item, the unit and unit operating agreements were reviewed. The unit agreement was reviewed first, page at a time. Comments of the Working Interest Owners were discussed and agreement reached on various revisions or deletions.

The unit operating agreement was then reviewed in the same manner. The major items of discussion were as follows:

Article 4.2	Agreement was reached to revise the provision to include the requirement that any request for monetary approval at a meeting must appear as an agenda item.
Article 7.9	Agreement was reached to include a provision requiring the unit operator to furnish informational AFE's to Working Interest Owners for any single capital expenditures in excess of $5000.

Article 10.2 Agreement was reached to provide for the inventory and pricing of items considered non-controllable as determined by the Working Interest Owners.

Article 10.3.2 In answer to questions, Mr. Buck explained that it was Shell's understanding that if any items of personal property and facilities were replaced by new items, the Investment Account would be reduced by the inventory value or actual installation cost of the item replaced and increased by the actual cost, including installation, of the new item. When given a specific example, Mr. Buck replied that if a treating or separation vessel, included in the original inventory, was replaced by a new vessel, the Investment Account would be reduced by the original inventory value of the replaced vessel and increased by the actual cost, including installation, of the new vessel. When asked about costs to deepen wells, Mr. Buck replied that it was Shell's understanding that such costs, being a part of the development program, would be charged on the basis of the investment participation and included in the adjustment of the Investment Account.

Article 18.1
Article 20.1.2 It was agreed that wells no longer needed for unit operations could be taken over by the Working Interest Owner by payment of net salvage value as estimated by Working Interest Owners.

Exhibit F (Accounting Procedure)

Because of the comments concerning the deletion of the word "direct" (Section I (1)) and the addition of the phrase "and related expenses"(Section II 2, A(1)), Mr. Buck offered the following explanation prior to review.

The revisions do not represent a change in Shell's accounting procedures or in the method of handling joint venture properties. The changes in the form are brought about by the use of the 1974-COPAS form.

Shell refers to their field operating Unit as a Production Unit. The employees and/or contract labor engaged in operating and maintaining the properties included in a Production Unit are supervised by a Production Foreman who is assisted by one or more Maintenance Foremen. The Production Unit is the First Level of Supervision. The salaries and related expenses of Production Unit Supervisors are considered as direct charges, since they were excluded from the calculation of overhead rates. All expenses of supervisory employees assigned to offices above a Production Unit, starting with the Division Production Superintendent, are included in Shell's overhead charges.

The COPAS-1974 Accounting Procedure defines First Level Supervisors as employees whose primary function is the direct supervision of other employees and/or contract labor. Previous COPAS Accounting Procedures did not include such a definition. Bulletin No. 8, associated with COPAS-1968 Accounting Procedure, defines First Level Supervisors as employees and their assistants who supervise other employees and/or contract labor. The COPAS-1968 form was acceptable to Shell. As supervision of Production Unit operating employees and/or contract labor by the Production Foreman may not always be direct, it was felt that the definition of the 1974-COPAS form could not be applied to Shell's organization. To avoid an interpretation that the Maintenance Foreman rather than the Production Unit is the First Level of Supervision, Shell felt it essential to delete the word "direct" when using the COPAS-1974 Accounting Procedure.

Related expenses are the expenses necessary for proper performance of the foreman's function. This would include such expenses as office rent, utilities, communication, answering service, and other miscellaneous expenses directly related to the Production Unit.

Although no formal vote was taken, it appeared that the unit and unit operating agreements, revised as discussed, were generally acceptable to the Working Interest Owners present and that it would not be necessary to submit revised drafts of the agreements. Mr. Buck advised that the agreements would be prepared in final form and submitted to the United States Department of Interior, Geological Survey and to the New Mexico State Land Office for review. If no revisions of substance are required by the governmental agencies, the agreements will be submitted to the working and royalty interests for ratification without further review. Depending on the time required for review by the governmental agencies, Mr. Buck estimated that the agreements would be submitted for ratification at some time between July 15, and August 1, 1978.

It was pointed out that ownership and lease data had been furnished to all Working Interest Owners by Shell's Land Department with the request that Shell be notified of any errors. As there are approximately 1500 royalty interests and 74 working interests, considerable time and effort would be required to correct data after the first printing of the agreements. Therefore, all parties are urged to review the data submitted as soon as possible and to advise Shell of any changes or corrections.

Mr. Buck noted that a unit of this size would require considerable preliminary planning and design work in order that injection operations could be commenced as early as possible after the effective date of unitization. As part of this preliminary work, Shell is proceeding to negotiate a water purchase agreement with the City of Hobbs, to purchase key rights-of-way and plant sites, and to design long delivery equipment and facilities. Shell will advise the Working Interest Owners from time to time of the progress of this work and the status of sign-up of working and royalty interests.

There being no further business, the meeting was adjourned.

Yours very truly

W. E. Buck
Chairman, Working Interests Owners' Committee
