Applicant Exhibit Four, Report	16

MR. STAMETS: We'll call Case 7085.

MR. PADILLA: Application of Harvey E. Yates Company for a designation of tight formation, Lea County, New Mexico.

MR. STAMETS: I'll ask for appearances in this case.

MR. STRAND: Mr. Examiner, Robert H. Strand, attorney from Roswell, appearing for the applicant, Harvey E. Yates Company; and I'll have two witnesses who need to be sworn.

MR. STAMETS: I'd like to have both stand and be sworn at this time, please.

(Witnesses sworn.)

MR. STRAND: Mr. Examiner, Harvey E. Yates Company is applicant in Case Number 7085 and is requesting the Division to recommend to the Federal Energy Regulatory Commission that the Atoka formation underlying approximately 37,760 acres in Township 12 South, 13 South, 14 South, all in Range 35 East, Township 12 South, Township 13 South, Township 14 South, in Range 36 East, as more particularly described in the application which has been filed in this matter, all in Lea County, New Mexico, be designated as a

1
2 tight formation, pursuant to Section 107 of the Natural Gas
3 Policy Act of 1978, and 18 CFR Section 271.701-705.
4

5
6 ANDREW LATTU

7 being called as a witness and being duly sworn upon his oath,
8 testified as follows, to-wit:
9

10 DIRECT EXAMINATION

11 BY MR. STRAND:

12 Q Will you please state your name for the
13 record?
14

15 A. Andrew Lattu.

16 Q Mr. Lattu, where do you reside and what
17 is your occupation?

18 A. I'm a geologist. I live in Midland,
19 Texas, and I work for Harvey E. Yates Company.

20 Q Mr. Lattu, have you testified before the
21 Division in the past and are your qualifications a matter of
22 record?

23 A. Yes, I have and they are.

24 MR. STRAND: Mr. Examiner, is Mr. Lattu
25 considered qualified as an expert geologist?
26

27 MR. STAMETS: Yes.

28 Q Mr. Lattu, are you familiar with the

1
2 application in Case Number 7085, which I have just described,
3 and have you prepared certain exhibits for presentation at
4 this hearing?

5
6 A. Yes, I have.

7 Q. Will you please briefly describe each of
8 these exhibits and how they relate to the application?

9 A. Yes, I will. Exhibit Number One is a
10 geologic structure map contoured on the top of the Devonian
11 in Lea County, New Mexico. The contour interval is 100 feet.
12 The map scale is one inch equals 8000 feet. This is from a
13 commercially prepared structure map by GeoMap Corporation.
14

15 There is also indicated on this map a
16 cross section A-A', which will be Exhibit Number Three.

17 This exhibit shows the, the Devonian
18 structure map shows the basic geologic structure within the
19 area of Lea County.

20 Q. Mr. Lattu, would you briefly describe
21 Exhibit Number Two?

22 A. Exhibit Number Two is a sand/shale ratio
23 map of the Atoka formation in the area of this application.
24 The Atoka section, the Atoka interval in this particular area
25 is essentially mostly shales and it has some thin bedded limes
26 and some sands within this interval, and the interval varies
27 from 700 to 900 feet in thickness.
28

1
2 And as these percent lines show, the
3 map scale here is contour interval of five percent and a hor-
4 izontal scale of one inch equals 4000 feet.

5 As you can see, the best developed sands
6 in this area are only 17 to 18 percent of the Atoka interval.

7 And this map shows more or less the depositional grain of
8 where these sands are expected to be encountered, the higher
9 percentage, of course, having more sands and therefor more
10 prospective.
11

12 This exhibit is most of the basis for
13 the outline of the area we have requested; that we feel with-
14 in this area is the area where we expect to find the Atoka
15 formation productive.
16

17 Q Mr. Lattu, for the record will you ex-
18 plain in a little more detail just exactly what a sand/shale
19 ratio map is?

20 A Well, you take the entire interval and
21 divide the net number of feet of sand by the net number of
22 feet of shale.

23 Q And the contour lines such as you have
24 on the map pictorially represent those ratios, is that correct?
25

26 A Yes, they do.

27 MR. STAMETS: What we're looking at,
28 then, when you -- on your 15 foot contour line --

1
2 A. It's 15 percent.

3 MR. STAMETS: 15 percent, so in 100 feet --

4 A. You'd have 15 feet of sand; of course,
5 if you had 1000 feet, 150 feet.

6 MR. STAMETS: What about your lime sec-
7 tions? Are those tossed out or is that included?

8 A. No, they're not included. Of course,
9 sometimes it's a little difficult to tell a sand from a lime
10 just from electric logs, but using all the data available, we
11 eliminated the limes and just used the sands and the shales.

12 Q. Mr. Lattu, would you please describe
13 Exhibit Number Three?

14 A. Yes. Exhibit Number Three is a cross
15 section, as indicated both on Exhibit Number One and Exhibit
16 Number Two as A-A'.

17 This cross section A-A' contains eighteen
18 wells, all of which are both near and within the boundaries
19 of our requested area for this hearing. Only one well has
20 been left out and that is down in Section 19 of 14, 36, which
21 is right on the eastern boundary of the requested area. Now
22 this well was still being drilled and hadn't been logged at
23 the time this exhibit was prepared. The Atoka sands were
24 found nonproductive in that well, both by drill stem test and
25 by log analysis, and we do have copies of that log available
26
27
28

1
2 if they're requested.

3 But other than that one exception, every
4 well within this area that penetrated the Atoka formation is
5 on this cross section.
6

7 Of all these wells only one has been
8 commercially productive at this time, and that is well number
9 twelve, the Harvey E. Yates No. 1 Betenbough in Section 32
10 of Township 13 South, Range 36 East.

11 Within this well we perforated five
12 separate sands in the Atoka formation for a net of 72 net
13 feet sand included in these perforations. Gross sand was
14 naturally much more than that. We were perforating the sands
15 that appeared productive by log analysis and drilling shows
16 and drill stem test.
17

18 Q Mr. Lattu, what is the gross thickness
19 of the Atoka formation which you have outlined on your cross
20 section, on the average?

21 A On the average, it varies from 700 to
22 nearly 900 feet. When you get up on top of very steep struc-
23 tures the Atoka formation thins, as in the case of this Union
24 of Texas, Petroleum Corporation, Shell State No. 1 in Section
25 6 of Township 13 South, Range 35 East, in which case it's ap-
26 proximately 440 feet thick.
27

28 Otherwise, it's about 700 to 900 feet.

1
2 The Atoka formation in this area, a little geologic history,
3 this is a fairly shallow, slowly subsiding basin. You had
4 essentially quiet waters. Sands and shales were periodically
5 washed out in this area from exposed rocks, both to the north
6 and to the west. And these sands were probably winnowed and
7 accumulated by along shore currents and possible tidal action
8 or wave action into a series of bars. And these bars occur
9 throughout the Atoka formation in this area.
10

11 The sands within these bars is fine
12 grained to medium grained sand; it's slightly calcareous; some
13 of them are very silty, and a few, of course, where you can
14 catch the center of one of these bars, are quite clean and
15 show good porosity.
16

17 Q Mr. Lattu, in this application we are
18 requesting that the entire Atoka formation as you've outlined
19 it on your cross section be designated a tight formation, is
20 that correct?

21 A Yes, it is.

22 Q But am I correct that what you're saying
23 is that within this gross interval of 700 to 900 feet, that
24 you have varying thicknesses of sands interspersed with
25 shale, as shown on your sand/shale ratio map?
26

27 A Yes. The -- the sands tend to be best
28 concentrated down, as the sand/shale ratio map shows, through

1
2 the center or the heart of the area requested; however, I
3 feel several -- because these sands are divided over such a
4 thick section, you could have an area with only, say, 8 per-
5 cent sand in the interval, but if you had 20 feet of sand, it
6 would still be productive.
7

8 But because of the nature of this and
9 this geology, or the history of this area, is fairly uniform
10 through this period of time, these bars are scattered verti-
11 cally up and down through the section in any one well.

12 Q Mr. Lattu, on the average what is the
13 depth from the surface to the top of the Atoka formation
14 underlying this area?
15

16 A Okay, within the area we're requesting
17 the tight reservoir designation for, it is approximately
18 12,200 feet.

19 Q Mr. Lattu, based on your analysis of
20 the -- of the geology of this formation, in your opinion does
21 it underly all of the area requested for tight formation?
22

23 A Yes, it does.

24 Q And to backtrack just a bit, on Exhibit
25 Number Two the outline of the requested area is set out in
26 a heavy crosshatched line.

27 A Yes. It's -- it's indicated by a heavy
28 line, with heavy lines and little dots.

Q. Is it further your opinion that the Atoka formation which you've described is at least potentially productive under the entire area?

A. Yes, I believe it is.

Q. Mr. Lattu, would you please describe the fresh water aquifers that underlie the area proposed for designation?

A. The fresh water aquifers are the Santa Rosa and the Ogalallah. The ~~Santa Rosa~~ ^{Ogalallah} is at a depth of from 300 to 400 feet and the ~~Ogalallah~~ ^{Santa Rosa} would be at a depth of 900 to 1200 feet.

Q. Do these fresh water aquifers occur quite uniformly under this area?

A. Fairly uniformly, yes.

Q. Are you familiar with the rules and policies of the Oil Conservation Division relating to casing and cementing programs for wells which would be drilled into the Atoka formation in this area?

A. Yes, I am.

Q. In your opinion would carrying out of such casing and cementing programs adequately protect these fresh water aquifers from contamination?

A. Yes, it will.

Q. Mr. Lattu, were Exhibits One through

1
2 Three prepared by you or under your supervision?

3 A. Yes, they were.

4 MR. STRAND: That's all I have for Mr.
5 Lattu.
6

7
8 CROSS EXAMINATION

9 BY MR. STAMETS:

10 Q. Mr. Lattu, I may have missed it, I be-
11 lieve you did say, or at least I interpreted, the dashed out-
12 line on Exhibit Number Two to be the area that has been re-
13 quested here.

14 A. Yes.

15 Q. Okay.

16 MR. STRAND: Mr. Examiner, the exact
17 legal description is set out in the application.
18

19 MR. STAMETS: All right, but for pur-
20 poses of cross examination; and whatnot, I want to be able
21 to relate that to what I saw on Exhibit Two.

22 Talking about lime zones awhile ago,
23 your analysis of the depositional environment would seem to
24 limit any lime zones to relatively thin stringers as opposed
25 to major reef buildup in this area.
26

27 A. Yes, it would. The Atoka formation
28 where these large carbonate and reef development occurs are

1

13

2

much further south; approximately down near the Texas-New
Mexico border.

3

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

26

27

28

Q

Would you approve a type log for this
area?

A

We should probably pick a well that's
producing and in that case it would be the Harvey E. Yates
No. 1 Betenbough in Section 32 of 13, 36.

Q

Okay. What -- do you have the top and
bottom of the Atoka there?

A

Let's see, I can read them off the
cross section. That is well number twelve on the cross section,
and the top of the Atoka appears to be about 12,230 and the
base of the Atoka formation will be 12,970.

MR. STAMETS: Are there any other ques-
tions of Mr. Lattu?

MR. PADILLA: I've got one or two.

CROSS EXAMINATION

BY MR. PADILLA:

Q

Mr. Lattu, did I understand you to say
that only the Betenbough No. 1 was producing from the Atoka
formation?

A

Yes, it is the only one that has been
producing.

1

14

2

Texas Crude-Sinclair Oil and Gas-Richardson 5 No.

3

1 attempted a completion that did not produce.

4

5

6

7

Q Has any other well in the subject area produced from the Atoka formation in the time that you've observed this?

8

A Not to my knowledge at all.

9

10

Q Do you know whether the Atoka formation has been tested specifically in the subject area?

11

12

13

A It's been tested, of course, by production from our No. 1 Betenbough and by drill stem tests on some recent wells we have drilled.

14

15

16

17

Q But historically, well, historically has the Atoka formation been considered a -- not a prospective formation in this area?

18

19

A Not in this -- not in this immediate area, no.

20

21

MR. PADILLA: I have no further questions.

22

23

MR. STAMETS: Any other questions of this witness? He may be excused.

24

25

MR. STAMETS: Mr. Examiner, we'll call Mr. Ralph Viney as our next witness.

26

27

28

RALPH VINEY

being called as a witness and being duly sworn upon his oath,
testified as follows, to-wit:

DIRECT EXAMINATION

BY MR. STRAND:

Q State your full name for the record.

A My name is Ralph Viney.

Q Mr. Viney, where do you reside and what
is your occupation?

A I'm an engineering consultant. I reside
in Midland.

Q Mr. Viney, have you been retained by
Harvey E. Yates Company to present testimony in Case Number
7085?

A Yes, sir.

Q Mr. Viney, have you testified before
the Division in the past and are your qualifications a matter
of record?

A Yes, sir.

MR. STRAND: Mr. Examiner, is Mr. Viney
considered qualified as a petroleum engineer?

MR. STAMETS: Yes.

Q Mr. Viney, are you familiar with the

1 application in Case Number 7085?

2 A. Yes, sir.

3 Q. And in that regard have you prepared
4 a set of exhibits relating to the engineering aspects of this
5 application, which we have designated as Exhibit Number Four?
6

7 A. Yes, sir.

8 Q. Referring to Exhibit Four-1, would you
9 please -- which is a summary of the basic data for each of
10 the wells set out thereon, will you please describe the perme-
11 ability calculations which you've arrived at, and the sup-
12 porting data?
13

14 A. Yes, sir, I will note that the two
15 wells are considered: A drill stem test, and a reservoir
16 build-up, and a drill stem test of a second well.

17 The permeability calculations are deter-
18 mined by a normal Horner build-up pressure -- reservoir pres-
19 sure build-up technique, and as you are aware, in the case
20 of drill stem tests the actual flow conditions are then related
21 to the actual pressure conditions during a shut-in period and
22 that pressure extrapolated to a dimensionless point and from
23 that the permeability and drainage radius calculations can
24 be made.
25

26 Q. Mr. Viney, would you describe the re-
27 sults of these calculations with respect to each of the wells
28 you have listed on the exhibit?

1
2 A. Yes, sir. In the case of the Betenbough
3 Well No. 1 drill stem test data, you will note that the flow
4 rate on this particular test was approximately 102 Mcf and
5 the calculated permeability by extrapolating the pressures and
6 using that data indicated a permeability of 0.025 millidarcy.
7

8 In the case of the reservoir build-up
9 test which was conducted after production from the Betenbough
10 Well, the test rate at the -- the flow rate prior to shutting
11 in and taking the reservoir build-up test was about 833 Mcf
12 per day, and this well was shut in for a considerable period
13 of time as you will notice in the data, and the permeability
14 calculated using this data was .0767.
15

16 It should be noted that the Betenbough
17 reservoir pressure build-up is after the well stimulation.
18 This well was acidized, produced, and the results then analyzed
19 and compared.

20 The third tabulation represents the
21 findings of a drill stem test on the Harvey E. Yates Superior
22 19 State No. 1 Well.
23

24 You will note that the flow rate in drill
25 stem test is 305 Mcf a day and the permeability was 0.01 of
26 a millidarcy.

27 Q. Mr. Viney, would you discuss the pay
28 section involved that these calculations were based on in

1
2 the Betenbough No. 1 Well?

3 A. Yes, sir. For the purposes of arriving
4 at a capacity or permeability footage value we used 72 feet
5 of pay section.
6

7 Q Does that 72 feet of pay section basi-
8 cally represent the perforated interval of the well?

9 A. Nearly, yes, sir.

10 Q And you heard Mr. Lattu's testimony
11 previously as to the characteristics of this Atoka formation
12 with various sands interspersed with shale. You did not con-
13 sider in your permeability calculation on this well these
14 other sands within this interval of 12,175 to 12,347?
15

16 A. No, sir, we only selected the high poro-
17 sity appearing sands.

18 Q Mr. Viney, considering Mr. Lattu's
19 geological testimony and your permeability analysis, is it
20 your opinion that the Atoka formation underlying the area
21 proposed for designation would be expected to have an estimated
22 average in situ gas permeability of less than 0.1 millidarcy
23 throughout the pay section?
24

25 A. Based on this evidence, yes, sir.

26 MR. STAMETS: Mr. Viney, considering
27 only the -- what you considered the higher permeability sands,
28 would that have a tendency to increase or decrease the perme-

1
2 ability figure that you arrive at?

3 A By using the lower thickness figure,
4 it would tend to give a maximum permeability that could be
5 expected.
6

7 MR. STAMETS: So if you considered the
8 entire interval, you would have even a lower number.

9 A It would probably be by a factor of 10
10 percent of this figure if you used the entire section, yes,
11 sir.

12 MR. STAMETS: Okay, thank you.

13 Q Mr. Viney, referring back to Exhibit
14 Four-1, would you please describe your analysis and calcula-
15 tions relating to production rates against atmospheric pres-
16 sure?
17

18 A Yes, sir. The flow rates, as shown on
19 the bottom of the exhibit, Four-1, are normal rates that you
20 would arrive at using a radial flow Darcy equation, which is
21 the standard equation used basically in all fluid flow measure-
22 ments. And you will note that with the radius of investiga-
23 tion during the test, why, none of the wells would exceed --
24 or none of the flow rates of any of these tests would exceed
25 more than 1215 Mcf per day.
26

27 Q Mr. Viney, have you also included as
28 Exhibit Four-2 a general statistical summary of production

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24
25
26
27
28

from the Betenbough No. 1 Well?

A. Yes, sir.

Q. And to what date does that summary contain information on production?

A. The summary in the exhibit is through November -- I mean, September 3rd.

Q. Have you also reviewed production figures from this well since that date and are they comparable?

A. Yes, sir, they are.

MR. STRAND: Mr. Examiner, we do have copies of those additional figures if you feel they're necessary.

MR. STAMETS: Okay.

Q. Mr. Viney, what is the status of the Superior 19 State No. 1 Well?

A. The Superior State No. 19-1 is temporarily abandoned and possibly can be re-entered at a later date.

Q. But there is no production history from that well?

A. No, sir, other than the drill stem test.

Q. Mr. Viney, based on your analysis of this data, is it your opinion that the stabilized production rate against atmospheric pressure of wells which might be com-

1
2 pleted for production in the Atoka formation we've been dis-
3 cussing without any type of stimulation would not be expected
4 to exceed 1238 Mcf per day?

5 A. Yes, sir, the probable rate would be
6 300 to 400 Mcf a day without stimulation.
7

8 Q And is it also your opinion that this
9 would be true generally throughout the area proposed for
10 designation?

11 A. Yes, sir, we would assume this would
12 hold.

13 Q Mr. Viney, referring to Exhibit Number
14 Four and the various types of information you have in there,
15 will you please describe the liquids produced from the forma-
16 tion and your conclusions as to their physical state in the
17 reservoir?
18

19 A. Yes, sir. The liquids as being pro-
20 duced are a light-colored, straw-colored liquid. The weather
21 (sic) gravity is approximately 46 degrees. We do not have
22 a recombination of the fluid samples at surface; however,
23 looking at the shape and performance of the build-up curves,
24 it would appear that we have a phase change at approximately
25 3560 pounds in the tubing liquids -- of the liquids in the
26 well, which would indicate with reason a dewpoint of appro-
27 ximately 3500 to 3600 pounds. Consequently, all liquids at
28

1
2 higher pressures would exist, all fluids would exist in a
3 single phase in the reservoir.

4 Q And what phase would that be?

5 A That would be a gas phase.

6 Q And that -- would that be the status of
7 the reservoir at the present time or at least at the time the
8 well was completed?

9 A Yes, sir.

10 Q What is the current pressure? Do you
11 have that information?

12 A Yes, sir, the current pressure as stated
13 on the build-ups, which will be Exhibit Four-1(b), is 4279
14 pounds. That is page five, Mr. Stamets.

15 Q Mr. Viney, is it then your opinion that
16 this liquids would be considered condensate as condensate is
17 normally defined as --

18 A Yes, sir.

19 Q -- opposed to crude oil?

20 A It would be a retrograde condensate in
21 all probability.

22 Q Would it also then be your opinion that
23 there would not be any crude oil produced from the proposed
24 tight formation?

25 A There is no crude in the reservoir so
26
27
28

1
2 none can be produced; it would all be condensate.

3 Q Mr. Viney, referring to Exhibit Four-3,
4 does this exhibit set out, together with other information,
5 the casing and cementing program utilized in the Betenbough
6 No. 1 Well?
7

8 A Yes, sir.

9 Q In your opinion would this type of pro-
10 gram adequately protect the fresh water aquifers described by
11 Mr. Lattu?

12 A Yes, sir. You will note that the sur-
13 face casing is set through 369 and cemented and the inter-
14 mediate string of 9-5/8ths is set through 4600, adequately
15 protecting both the 900 to 1200 and the 300 to 400 water zones.
16

17 Q To your knowledge, Mr. Viney, does this
18 casing and cementing program conform with the regulations and
19 policies of the Oil Conservation Division relating to this
20 field?

21 A As I understand it, yes, sir.

22 Q And in your opinion would compliance
23 generally with rules -- with their rules for this type of well
24 protect the fresh water aquifers?
25

26 A Yes, sir.

27 Q Mr. Viney, with regard to various types
28 of treatment programs which might be employed for the wells b

1
2 be completed in the Atoka formation, in your opinion would
3 they have any adverse affect on the fresh water aquifers?

4 A. They should not if the casing is properly
5 cemented, no, sir.
6

7 Q Was Exhibit Number Four prepared by you
8 or under your supervision?

9 A. Yes, sir.

10 MR. STRAND: Mr. Examiner, I move the
11 admission of Exhibits One through Four.

12 MR. STAMETS: Exhibit Number -- all the
13 exhibits are accepted.
14

15 MR. STRAND: And that's all I have of
16 Mr. Viney on direct.

17 MR. STAMETS: Are there questions of
18 Mr. Viney? Mr. Padilla.
19

20 CROSS EXAMINATION

21 BY MR. PADILLA:

22 Q I'm not sure whether Mr. Viney can an-
23 swer this question. It's of a general nature. Even you, Mr.
24 Strand!
25

26 Is any area, or the subject area being
27 currently developed by infill drilling as defined in the
28 rules and regulations?

1
2 MR. STRAND: No, not to my knowledge.

3 A. Not to our knowledge, no, sir.

4 Q Mr. Viney, what type of stimulation
5 techniques would be required in addition to acidizing for the
6 Atoka formation? Would any other type of technique be re-
7 quired?
8

9 A. Since none have been done, Mr. Padilla,
10 a fracture treatment would appear very suitable for this type
11 of formation, but since we don't know what it would -- how
12 it would react, I cannot say, but if we take engineering tech-
13 nique, yes, a fracture treatment could possibly increase the
14 productivity of these wells.
15

16 Q Do you estimate that stimulation will be
17 required in all the wells drilled to the Atoka?

18 A. I would say that you'd at least have to
19 have acid cleanup work, or some acid work, to clean up your --
20 some possible mud filtrate around the wellbore, yes, sir.

21 Q What I'm trying to get at is would you
22 necessarily require massive stimulation for the Atoka formation
23 in the subject area?
24

25 A. I'm not going to say you would require
26 it. It may be desireable, yes, sir.

27 MR. STRAND: Mr. Viney, isn't the treat-
28 ment programs that you would employ on these types of wells

1
2 something that would have to be determined from each indivi-
3 dual well, logs and tests, and so forth?

4 A. Well, on the flow rates you'd want to
5 look at your initial flow rate prior to stimulation, and your
6 flow rate after a massive clean-up, and then from that point
7 I think, Mr. Padilla, you could possibly generalize and say
8 I'd want to go to a larger treatment, whether it be acid, or
9 acid frac, or some type of propping fracture method.
10

11 MR. STRAND: Mr. Viney, can you conceive
12 of any type of fracturing program, be it however exotic, which
13 would cause any kind of problem with the fresh water aquifers?
14

15 A. No, sir, there should be no problem.
16 Again this will depend upon the cementing condition around
17 the producing zones, and if properly cemented should not
18 migrate 10 or 12,000 feet.

19 Q. Another general question. Where is the
20 subject located in relation to -- to the closest towns in Lea
21 County?

22 A. Tatum, I guess, would be --

23 MR. STRAND: Yeah, well, approximately --
24

25 A. McDonald and Tatum, I guess.

26 MR. STRAND: Approximately 10 miles
27 south of Tatum. So really the area proposed for designation,
28 the northern boundary would be approximately 2-1/2 to 3 miles

1
2 southwest of Tatum.

3 MR. PADILLA: I have nothing else.
4

5 CROSS EXAMINATION
6

7 BY MR. STAMETS:

8 Q Mr. Viney, the two sets of calculations
9 that you run through to show in situ permeability --

10 A Yes, sir.

11 Q -- are both located on the eastern edge
12 of the area --

13 A Yes, sir.

14 Q -- and fairly close together. Why do
15 you feel that we should expect to see this same permeability
16 apply to this somewhat larger area?
17

18 A Based on the geological information
19 developed, Mr. Stamets, and the conditions that appear through-
20 out the sections of the logs, the conditions of the deposition
21 appear almost identical.
22

23 I can't answer that it will occur be-
24 cause I don't know, but based on the interpretation of the
25 sands and the -- in other wells and in the wells that we
26 tested, they appear very identical or very similar.

27 MR. STRAND: Would that same permeability
28 factor be expected to occur?

1
2 A. Based on what we have seen, the condi-
3 tions and the sands appear the same, you would have to make
4 that conclusion based on the evidence at hand.

5 MR. STAMETS: Any other questions of
6 the witness? He may be excused.

7
8 Anything further in this case?

9 MR. STRAND: Nothing further, Mr. Exa-
10 miner.

11 MR. STAMETS: If there is nothing fur-
12 ther, the case will be taken under advisement.

STATE OF NEW MEXICO
ENERGY AND MINERALS DEPARTMENT
OIL CONSERVATION DIVISION

IN THE MATTER OF THE HEARING
CALLED BY THE OIL CONSERVATION
DIVISION FOR THE PURPOSE OF
CONSIDERING:

CASE NO. 7085
Order No. R-6537

APPLICATION OF HARVEY E. YATES
COMPANY FOR DESIGNATION OF A
TIGHT FORMATION, LEA COUNTY,
NEW MEXICO.

ORDER OF THE DIVISION

BY THE DIVISION:

This cause came on for hearing at 9 a.m. on November 12, 1980, at Santa Fe, New Mexico, before Examiner Richard L. Stamets.

NOW, on this 17th day of December, 1980, the Division Director, having considered the testimony, the record, and the recommendations of the Examiner, and being fully advised in the premises,

FINDS:

(1) That due public notice having been given as required by law, the Division has jurisdiction of this cause and the subject matter thereof.

(2) That the applicant, Harvey E. Yates Company, requests that the Division in accordance with Section 107 of the Natural Gas Policy Act, and 18 C.F.R. §271.703 recommend to the Federal Energy Regulatory Commission that the Atoka formation underlying the following lands situated in Lea County, New Mexico, hereinafter referred to as the Atoka formation, be designated as a tight formation in said Federal Energy Regulatory Commission's regulations:

TOWNSHIP 12 SOUTH, RANGE 35 EAST, NMPM
Sections 33 through 36: All

TOWNSHIP 12 SOUTH, RANGE 36 EAST, NMPM
Section 31: All

TOWNSHIP 13 SOUTH, RANGE 35 EAST, NMPM

Sections 1 through 4: All
Sections 9 through 16: All
Sections 21 through 28: All
Sections 33 through 36: All

TOWNSHIP 13 SOUTH, RANGE 36 EAST, NMPM

Sections 6 and 7: All
Sections 18 through 20: All
Sections 29 through 32: All

TOWNSHIP 14 SOUTH, RANGE 35 EAST, NMPM

Sections 1 through 4: All
Sections 9 through 16: All
Sections 21 through 24: All

TOWNSHIP 14 SOUTH, RANGE 36 EAST, NMPM

Sections 5 through 7: All
Sections 18 and 19: All

Containing a total of 37,760 acres, more or less.

(3) That the Atoka formation underlies all of the above described lands; that the formation consists of shales interspersed with thin lime and sand sections; that the top of such formation is found at an average depth of 12,200 feet below the surface of the area set out in Finding No. (2) above; and that the thickness of such formation is from 700 to 900 feet within said area.

(4) That the type section for the Atoka formation for the proposed tight formation designation is found at a depth of from approximately 12,230 feet to 12,970 feet on the Gamma Ray-Neutron log dated May 18, 1980, from the Harvey E. Yates Company Betenbough No. 1 Well located in Unit C of Section 32, Township 13 South, Range 36 East, Lea County, New Mexico.

(5) That the following described well produces natural gas from the Atoka formation within the proposed area:

Harvey E. Yates Company
Betenbough #1

660 feet from North line and 1980 feet from West line of Section 32, Township 13 South, Range 36 East, N.M.P.M., Lea County, New Mexico.

(6) That the Atoka formation underlying the above described lands has been penetrated by several other wells, none of which produced natural gas in commercial quantities from the Atoka formation.

(7) That the evidence presented in this case demonstrated that no well formerly or currently completed in the Atoka formation within the proposed area exhibited permeability, gas productivity, or crude oil productivity in excess of the following parameters:

- (a) average in situ gas permeability throughout the pay section of 0.1 millidarcy; and
- (b) stabilized production rates, without stimulation, against atmospheric pressure, as found in the table set out in 18 C.F.R. §271.703(c)(2)(B) of the regulations; and
- (c) production of more than five barrels of crude oil per day.

(8) That based on analysis of available data from existing wells within the proposed area and utilizing generally and customarily accepted petroleum engineering techniques and measurements:

- (a) The estimated average in situ gas permeability throughout the pay section of the Atoka formation is expected to be 0.1 millidarcy or less; and
- (b) The stabilized production rate, against atmospheric pressure, of wells completed for production in the Atoka formation, without stimulation, is not expected to exceed production levels determined by reference to well depth, as found in the table set out in 18 C.F.R. §271.703 (c)(2)(B) of the regulations; and
- (c) No well drilled into the formation is expected to produce, without stimulation, more than five barrels of crude oil per day.

(9) That within the proposed area there are two recognized aquifers being the Ogallala, found at depths of from 300 feet to 400 feet, and the Santa Rosa, found at depths of from 900 feet to 1200 feet or approximately 11,000 feet above the Atoka formation.

(10) That existing State of New Mexico and Federal Regulations relating to casing and cementing of wells will assure that development of the Atoka formation will not adversely affect said aquifers.

(11) That the Atoka formation, or any portion thereof, as described herein, is not currently being developed by infill drilling as defined in 18 C.F.R. §271.703(b)(6) of the regulations.

(12) That the Atoka formation within the proposed area should be recommended to the Federal Energy Regulatory Commission for designation as a tight formation.

IT IS THEREFORE ORDERED:

(1) That it be and hereby is recommended to the Federal Energy Regulatory Commission pursuant to Section 107 of the Natural Gas Policy Act of 1978, and 18 C.F.R. §271.703 of the regulations that the Atoka formation underlying the following described lands in Lea County, New Mexico, be designated as a tight formation:

TOWNSHIP 12 SOUTH, RANGE 35 EAST, NMPM
Sections 33 through 36: All

TOWNSHIP 12 SOUTH, RANGE 36 EAST, NMPM
Section 31: All

TOWNSHIP 13 SOUTH, RANGE 35 EAST, NMPM
Sections 1 through 4: All
Sections 9 through 16: All
Sections 21 through 28: All
Sections 33 through 36: All

TOWNSHIP 13 SOUTH, RANGE 36 EAST, NMPM
Sections 6 and 7: All
Sections 18 through 20: All
Sections 29 through 32: All

TOWNSHIP 14 SOUTH, RANGE 35 EAST, NMPM
Sections 1 through 4: All
Sections 9 through 16: All
Sections 21 through 24: All

TOWNSHIP 14 SOUTH, RANGE 36 EAST, NMPM
Sections 5 through 7: All
Sections 18 and 19: All

-5-
Case No. 7085
Order No. R-6537

Containing a total of 37,760 acres, more or less.

(2) That jurisdiction of this cause is hereby retained for the entry of such further orders as the Division may deem necessary.

DONE at Santa Fe, New Mexico, on the day and year hereinabove designated.

Formation Designation
Lea County, New Mexico

Gentlemen:

Enclosed are the following relating to the above referenced hearing:

1. Two copies of the transcript.
2. Two copies of a proposed order.
3. Envelope with postage addressed to the Federal Energy Regulatory Commission.

We have reviewed the transcript and would request that lines 10-13 on page 11 be corrected on the file transcript as indicated. Also, as we discussed after the hearing, you have sufficient copies of the Exhibits so that a set can be included in the packet to be sent to the Federal Energy Regulatory Commission.

If you need anything further, please let me know.

Sincerely yours,

NGPA SECTION 107 TIGHT
FORMATION RECOMMENDATION

STATE OF NEW MEXICO OIL
CONSERVATION DIVISION OF
THE ENERGY AND MINERALS
DEPARTMENT

Docket No.

RECOMMENDATION FOR TIGHT
FORMATION DESIGNATION UNDER
SECTION 107 OF THE NGPA.

Harvey E. Yates Company, pursuant to Section 107 of the Natural Gas Policy Act, 18 CFR §271.703 of the FERC regulations, and the Special Rules and Procedures for Tight Formation Designations under Section 107 of the Natural Gas Policy Act of 1978 of the Oil Conservation Division, petitioned the Oil Conservation Division for tight formation designation of a portion of the Atoka formation in Lea County, New Mexico.

After notice and hearing on the application of Harvey E. Yates Company, the Oil Conservation Division hereby recommends that that portion of the Atoka formation which is described in Exhibit A (being Oil Conservation Division Order No. R-6537) attached hereto and incorporated by reference, be designated a tight formation. Additionally, the Oil Conservation Division, submits herewith Exhibits B and C, attached hereto and incorporated herein by reference, which are supporting data required under 18 CFR §271.703(c)(3) of the FERC regulations and United States Geological Survey ratification of this recommendation, respectively.

Respectfully submitted,

IN THE MATTER OF THE APPLICATION :
OF HARVEY E. YATES COMPANY FOR :
DESIGNATION OF A TIGHT FORMATION :
LEA COUNTY, NEW MEXICO :

Case No. 7085

APPLICATION

COMES NOW HARVEY E. YATES COMPANY by its attorney and respectfully states;

1. Applicant is the owner of an interest in the Atoka formation underlying the following described lands situated in Lea County, New Mexico:

Township 12 South, Range 35 East, N.M.P.M.
Sections 33, 34, 35, 36

Township 13 South, Range 35 East, N.M.P.M.
Sections 1, 2, 3, 4, 9, 10, 11, 12, 13,
14, 15, 16, 21, 22, 23, 24, 25,
26, 27, 28, 33, 34, 35, 36

Township 14 South, Range 35 East, N.M.P.M.
Sections 1, 2, 3, 4, 9, 10, 11, 12, 13,
14, 15, 16, 21, 22, 23, 24

Township 12 South, Range 36 East, N.M.P.M.
Section 31

Township 13 South, Range 36 East, N.M.P.M.
Sections 6, 7, 18, 19, 20, 29, 30, 31, 32

Township 14 South, Range 36 East, N.M.P.M.
Sections 5, 6, 7, 18, 19

Containing a total of 37,760 acres more or less.

2. The Atoka formation underlying the above described lands is expected to have an estimated average in situ gas permeability throughout the pay section of less than 0.1 millidarcy.

3. The stabilized production rate, against atmospheric pressure of wells completed for production in said formation, without stimulation, is not expected to exceed the production levels set out in 18 C.F.R. §271.703 (c)(2)(B).

4. No well drilled into said formation is expected to produce, without stimulation, more than five barrels of crude oil per day.

WHEREFORE, applicant prays:

A. That this application be set for hearing before an examiner, and that notice of said hearing be given as required by law.

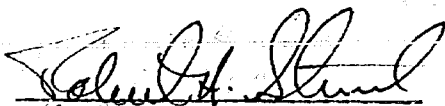

B. That upon such hearing, the Division enter its order recommending to the Federal Energy Regulatory Commission that pursuant to 18 CFR, Section 271.701-705, the Atoka formation underlying the above described lands be designated a tight formation.

C. For such further relief as the Division deems just and proper.

DATED this 21st day of October, 1980.

Sections 6, 7, 18, 19, 20, 29, 30, 31, 32

Township 14 South, Range 36 East, N.M.P.M.
Sections 5, 6, 7, 18, 19

Containing a total of 37,760 acres more or less.

2. The Atoka formation underlying the above described lands is expected to have an estimated average in situ gas permeability throughout the pay section of less than 0.1 millidarcy.

3. The stabilized production rate, against atmospheric pressure of wells completed for production in said formation, without stimulation, is not expected to exceed the production levels set out in 18 C.F.R. §271.703 (c)(2)(B).

4. No well drilled into said formation is expected to produce, without stimulation, more than five barrels of crude oil per day.

WHEREFORE, applicant prays:

A. That this application be set for hearing before an examiner, and that notice of said hearing be given as required by law.

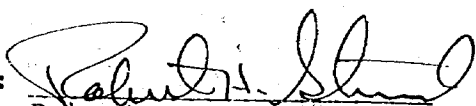

B. That upon such hearing, the Division enter its order recommending to the Federal Energy Regulatory Commission that pursuant to 18 CFR, Section 271.701-705, the Atoka formation underlying the above described lands be designated a tight formation.

C. For such further relief as the Division deems just and proper.

DATED this 21st day of October, 1980.

Gentlemen:

RE: Docket No. RM79-76 (New Mexico-2)
NOTICE OF PROPOSED RULEMAKING
BY DIRECTOR, OPR

Husky Oil Company ("Husky") is active in exploration and production in the Rocky Mountain Region. Husky currently has oil and gas production in portions of New Mexico.

Husky wishes to support the recommendation of the State of New Mexico Oil Conservation Division that the Atoka Formation be designated a tight formation under the Commission's final regulation, Section 271.703. Husky believes that such a designation will offer the needed economic stimulus for further natural gas exploration in this area. Husky further believes that the technology required to protect the environment is currently available.

Thank you for the opportunity to comment.

Sincerely,

R. M. Davidson
Vice President

OIL CONSERVATION DIVISION

IN THE MATTER OF THE HEARING
CALLED BY THE OIL CONSERVATION
DIVISION FOR THE PURPOSE OF
CONSIDERING:

CASE NO. 7085
Order No. R-6537

APPLICATION OF HARVEY E. YATES
COMPANY FOR DESIGNATION OF A
TIGHT FORMATION, LEA COUNTY,
NEW MEXICO.

ORDER OF THE DIVISION

BY THE DIVISION:

This cause came on for hearing at 9 a.m. on November 12, 1980, at Santa Fe, New Mexico, before Examiner Richard L. Stamets.

NOW, on this 17th day of December, 1980, the Division Director, having considered the testimony, the record, and the recommendations of the Examiner, and being fully advised in the premises,

FINDS:

(1) That due public notice having been given as required by law, the Division has jurisdiction of this cause and the subject matter thereof.

(2) That the applicant, Harvey E. Yates Company, requests that the Division in accordance with Section 107 of the Natural Gas Policy Act, and 18 C.F.R. §271.703 recommend to the Federal Energy Regulatory Commission that the Atoka formation underlying the following lands situated in Lea County, New Mexico, herein-after referred to as the Atoka formation, be designated as a tight formation in said Federal Energy Regulatory Commission's regulations:

TOWNSHIP 12 SOUTH, RANGE 35 EAST, NMPM
Sections 33 through 36: All

TOWNSHIP 12 SOUTH, RANGE 36 EAST, NMPM
Section 31: All

-2-

Case No. 7085

Order No. R-6537

TOWNSHIP 13 SOUTH, RANGE 35 EAST, NMPM

Sections 1 through 4: All
Sections 9 through 16: All
Sections 21 through 28: All
Sections 33 through 36: All

TOWNSHIP 13 SOUTH, RANGE 36 EAST, NMPM

Sections 6 and 7: All
Sections 18 through 20: All
Sections 29 through 32: All

TOWNSHIP 14 SOUTH, RANGE 35 EAST, NMPM

Sections 1 through 4: All
Sections 9 through 16: All
Sections 21 through 24: All

TOWNSHIP 14 SOUTH, RANGE 36 EAST, NMPM

Sections 5 through 7: All
Sections 18 and 19: All

Containing a total of 37,760 acres, more or less.

(3) That the Atoka formation underlies all of the above described lands; that the formation consists of shales interspersed with thin lime and sand sections; that the top of such formation is found at an average depth of 12,200 feet below the surface of the area set out in Finding No. (2) above; and that the thickness of such formation is from 700 to 900 feet within said area.

(4) That the type section for the Atoka formation for the proposed tight formation designation is found at a depth of from approximately 12,230 feet to 12,970 feet on the Gamma Ray-Neutron log dated May 18, 1980, from the Harvey E. Yates Company Betenbough No. 1 Well located in Unit C of Section 32, Township 13 South, Range 36 East, Lea County, New Mexico.

(5) That the following described well produces natural gas from the Atoka formation within the proposed area:

Harvey E. Yates Company
Betenbough #1

660 feet from North line and 1980 feet from West line of Section 32, Township 13 South, Range 36 East, N.M.P.M., Lea County, New Mexico.

(6) That the Atoka formation underlying the above described lands has been penetrated by several other wells, none of which produced natural gas in commercial quantities from the Atoka formation.

(7) That the evidence presented in this case demonstrated that no well formerly or currently completed in the Atoka formation within the proposed area exhibited permeability, gas productivity, or crude oil productivity in excess of the following parameters:

- (a) average in situ gas permeability throughout the pay section of 0.1 millidarcy; and
- (b) stabilized production rates, without stimulation, against atmospheric pressure, as found in the table set out in 18 C.F.R. §271.703(c)(2)(B) of the regulations; and
- (c) production of more than five barrels of crude oil per day.

(8) That based on analysis of available data from existing wells within the proposed area and utilizing generally and customarily accepted petroleum engineering techniques and measurements:

- (a) The estimated average in situ gas permeability throughout the pay section of the Atoka formation is expected to be 0.1 millidarcy or less; and
- (b) The stabilized production rate, against atmospheric pressure, of wells completed for production in the Atoka formation, without stimulation, is not expected to exceed production levels determined by reference to well depth, as found in the table set out in 18 C.F.R. §271.703 (c)(2)(B) of the regulations; and
- (c) No well drilled into the formation is expected to produce, without stimulation, more than five barrels of crude oil per day.

(9) That within the proposed area there are two recognized aquifers being the Ogallala, found at depths of from 300 feet to 400 feet, and the Santa Rosa, found at depths of from 900 feet to 1200 feet or approximately 11,000 feet above the Atoka formation.

-4-

Case No. 7085
Order No. R-6537

(10) That existing State of New Mexico and Federal Regulations relating to casing and cementing of wells will assure that development of the Atoka formation will not adversely affect said aquifers.

(11) That the Atoka formation, or any portion thereof, as described herein, is not currently being developed by infill drilling as defined in 18 C.F.R. §271.703(b)(6) of the regulations.

(12) That the Atoka formation within the proposed area should be recommended to the Federal Energy Regulatory Commission for designation as a tight formation.

IT IS THEREFORE ORDERED:

(1) That it be and hereby is recommended to the Federal Energy Regulatory Commission pursuant to Section 107 of the Natural Gas Policy Act of 1978, and 18 C.F.R. §271.703 of the regulations that the Atoka formation underlying the following described lands in Lea County, New Mexico, be designated as a tight formation:

TOWNSHIP 12 SOUTH, RANGE 35 EAST, NMPM
Sections 33 through 36: All

TOWNSHIP 12 SOUTH, RANGE 36 EAST, NMPM
Section 31: All

TOWNSHIP 13 SOUTH, RANGE 35 EAST, NMPM
Sections 1 through 4: All
Sections 9 through 16: All
Sections 21 through 28: All
Sections 33 through 36: All

TOWNSHIP 13 SOUTH, RANGE 36 EAST, NMPM
Sections 6 and 7: All
Sections 18 through 20: All
Sections 29 through 32: All

TOWNSHIP 14 SOUTH, RANGE 35 EAST, NMPM
Sections 1 through 4: All
Sections 9 through 16: All
Sections 21 through 24: All

TOWNSHIP 14 SOUTH, RANGE 36 EAST, NMPM
Sections 5 through 7: All
Sections 18 and 19: All

-5-

Case No. 7005
Order No. R-6537

Containing a total of 37,760 acres, more or less.

(2) That jurisdiction of this cause is hereby retained for the entry of such further orders as the Division may deem necessary.

DONE at Santa Fe, New Mexico, on the day and year hereinabove designated.

CASE 7083: Application of Bass Enterprises Production Co. for compulsory pooling, Lea County, New Mexico. Applicant, in the above-styled cause, seeks an order pooling all mineral interests in the Wolfcamp, Cisco, Canyon and Strawn formations underlying the S/2 NE/4 of Section 13, Township 16 South, Range 36 East, Northeast Lovington Field, to be dedicated to a well to be drilled at a standard location thereon. Also to be considered will be the cost of drilling and completing said well and the allocation of the cost thereof as well as actual operating costs and charges for supervision, designation of applicant as operator of the well, and a charge for risk involved in drilling said well.

CASE 7005: (Continued from October 29, 1980, Examiner Hearing)

Application of Sol West III for an NCPA determination, Eddy County, New Mexico. Applicant, in the above-styled cause, seeks a new onshore reservoir determination in the Morrow formation for his Turkey Track-Morrow Sand Well No. 1 in Unit 1 of Section 26, Township 18 South, Range 28 East.

CASE 7038: (Continued from October 29, 1980, Examiner Hearing)

Application of Natura Energy Corporation for compulsory pooling, Lea County, New Mexico. Applicant, in the above-styled cause, seeks an order pooling all mineral interests in the San Andres formation underlying the NE/4 NE/4 of Section 6, Township 19 South, Range 39 East, to be dedicated to a well to be drilled at a standard location thereon. Also to be considered will be the cost of drilling and completing said well and the allocation of the cost thereof as well as actual operating costs and charges for supervision, designation of applicant as operator of the well, and a charge for risk involved in drilling said well.

CASE 7073: (Readvertised)

Application of Enserch Exploration, Inc. for pool creation, temporary special pool rules, and assignment of a discovery allowable, Chaves County, New Mexico. Applicant, in the above-styled cause, seeks the creation of a new Fusselman oil pool for its J. G. O'Brien Well No. 1 located 1980 feet from the North line and 660 feet from the West line of Section 31, Township 7 South, Range 29 East, with special rules therefor, including provisions for 80-acre spacing, a limiting gas-oil ratio of 3000 to one and special well location requirements providing for the drilling of wells within 150 feet of the center of a quarter-quarter section. Applicant further seeks approval of a 74.24-acre proration and spacing unit and a discovery allowable for said J. G. O'Brien Well No. 1.

CASE 7084: Application of Harvey E. Yates Company for a unit agreement, Lea County, New Mexico. Applicant, in the above-styled cause, seeks approval for the Duncan Unit Area, comprising 7679 acres, more or less, of State, Federal, and fee lands in Townships 13 and 14 South, Range 35 East.

CASE 7085: Application of Harvey E. Yates Company for designation of a tight formation, Lea County, New Mexico. Applicant, in the above-styled cause, seeks the designation of the Atoka formation underlying portions of Townships 12, 13, and 14 South, Ranges 35 and 36 East, containing 37,760 acres, more or less, as a tight formation pursuant to Section 107 of the Natural Gas Policy Act and 18 CFR Section 271.701-705.

CASE 7086: Application of Blackwood & Nichols Company, Ltd. for designation of a tight formation, San Juan and Rio Arriba Counties, New Mexico. Applicant, in the above-styled cause, seeks the designation of the Pictured Cliffs formation underlying portions of Townships 30 and 31 North, Ranges 6, 7, and 8 West, containing 33,500 acres, more or less, as a tight formation pursuant to Section 107 of the Natural Gas Policy Act and 18 CFR Section 271.701-705.

CASE 7087: Application of Blackwood & Nichols Company, Ltd. for designation of a tight formation, San Juan and Rio Arriba Counties, New Mexico. Applicant, in the above-styled cause, seeks the designation of the Fruitland formation underlying portions of Townships 30 and 31 North, Ranges 6, 7, and 8 West, containing 33,500 acres, more or less, as a tight formation pursuant to Section 107 of the Natural Gas Policy Act and 18 CFR Section 271.701-705.

Called in by Bob Strand

Application of Harvey E. Yates Company for designation of
a tight formation, Lea County, New Mexico.

Applicant seeks designation of the Atoka formation as a
tight formation underlying the following-described lands:

Township 12 South, Range 35 East: Sections 33, 34, 35, and 36;

Township 13 South, Range 35 East: Sections 1, 2, 3, 4, 9, 10,
11, 12, 13, 14, 15, 16, 21,
22, 23, 24, 25, 26, 27, 28,
33, 34, 35, and 36

Township 14 South, Range 35 East: Sections 1, 2, 3, 4, 9, 10,
11, 12, 13, 14, 15, 16, 21,
22, 23, 24

Township 12 South, Range 36 East: Section 31

Township 13 South, Range 36 East: Sections 6, 7, 18, 19, 20,
29, 30, 31, and 32

Township 14 South, Range 36 East: Sections 5, 6, 7, 18, and 19

Total of 37,760 acres

OIL CONSERVATION DIVISION

IN THE MATTER OF THE HEARING
CALLED BY THE OIL CONSERVATION
DIVISION FOR THE PURPOSE OF
CONSIDERING:

CASE NO. 7085

Order No.

R-6537

APPLICATION OF HARVEY E. YATES
COMPANY FOR DESIGNATION OF A
TIGHT FORMATION, LEA COUNTY,
NEW MEXICO.

ORDER OF THE DIVISION

BY THE DIVISION:

This cause came on for hearing at 9 a.m. on November 12, 1980, at Santa Fe, New Mexico, before Examiner Richard L. Stamets.

NOW, on this _____ day of December, 1980, the Division Director, having considered the testimony, the record, and the recommendations of the Examiner, and being fully advised in the premises,

FINDS:

(1) That due public notice having been given as required by law, the Division has jurisdiction of this cause and the subject matter thereof.

(2) That the applicant, Harvey E. Yates Company, requests that the Division in accordance with Section 107 of the Natural Gas Policy Act, and 18 C.F.R. §271.703 recommend to the Federal Energy Regulatory Commission that the Atoka formation underlying the following lands situated in Lea County, New Mexico, hereinafter referred to as the Atoka formation, be designated as a tight formation in said Federal Energy Regulatory Commission's regulations:

Township 12 South, Range 35 East, N.M.P.M.

Sections 33 through 36 : All

Township 12 South, Range 36 East, N.M.P.M.

Section 31 : All

Township 13 South, Range 35 East, N.M.P.M.

Sections 1 through 4 : All

Sections 9 through 16 : All

Sections 21 through 28 : All

Sections 33 through 36 : All

Township 13 South, Range 36 East, N.M.P.M.

Sections 6 and 7 : All

Sections 18 through 20 : All

Sections 29 through 32 : All

Township 14 South, Range 35 East, N.M.P.M.

Sections 1 Through 4: A 11

Sections 9 Through 16: A 11

Sections 21 Through 24: A 11

~~Sections~~

Township 14 South, Range 36 East, N.M.P.M.

Sections 5 Through 7: A 11

Sections 18 and 19: A 11

Township 12 South, Range 36 East, N.M.P.M.
Section 31

Township 13 South, Range 36 East, N.M.P.M.
Sections 6, 7, 18, 19, 20, 29, 30, 31, 32

Township 14 South, Range 36 East, N.M.P.M.
Sections 5, 6, 7, 18, 19

Containing a total of 37,760 acres, more or less.

(3) That the Atoka formation underlies all of the above described lands; that the formation consists of shales interspersed with thin lime and sand sections; that the top of such formation is found at an average depth of 12,200 feet below the surface of the area set out in Finding No. (2) above; and that the thickness of such formation is from 700 to 900 feet within said area.

(4) That the type section for the Atoka formation for the proposed tight formation designation is found at a depth of from approximately 12,230 feet to 12,970 feet on the Gamma Ray-Neutron log dated May 18, 1980, from the Harvey E. Yates Company Betenbough No. 1 Well located in Unit C of Section 32, Township 13 South, Range 36 East, Lea County, New Mexico.

(5) That the following ^{described} well produces ~~or have produced~~ natural gas from the ~~Austin-Mississippian~~ ^{Atoka} formation within the proposed area:

Harvey E. Yates Company
Betenbough #1

660 feet from North line and
1980 feet from West line of
Section 32, Township 13 South,
Range 36 East, N.M.P.M., Lea
County, New Mexico

(6) That the Atoka formation underlying the above described lands has been penetrated by several other wells, none of which produced natural gas in commercial quantities from the Atoka formation.

(7) That the evidence presented in this case demonstrated that no well formerly or currently completed in the Atoka formation within the proposed area exhibited permeability, gas productivity, or crude oil productivity in excess of the following parameters:

- (a) average in situ gas permeability throughout the pay section of 0.1 millidarcy; and
- (b) stabilized production rates, without stimulation, against atmospheric pressure, as found in the table set out in 18 C.F.R. §271.703(c)(2)(B) of the regulations; and

- (c) production of more than five barrels of crude oil per day.

(8) That based on analysis of available data from existing wells within the proposed area and utilizing generally and customarily accepted petroleum engineering techniques and measurements:

- (a) The estimated average in situ gas permeability throughout the pay section of the Atoka formation is expected to be 0.1 millidarcy or less; and

- (b) The stabilized production rate, against atmospheric pressure, of wells completed for production in the Atoka formation, without stimulation, is not expected to exceed production levels determined by reference to well depth, as found in the table set out in 18 C.F.R. §271.703 (c)(2)(B) of the regulations; and

- (c) No well drilled into the formation is expected to produce, without stimulation, more than five barrels of crude oil per day.

(9) That within the proposed area there are two recognized ~~water~~ aquifers being the Ogallala, found at depths of from 300 feet to 400 feet, and the Santa Rosa, found at depths of from 900 feet to 1200 feet ~~on approximately 11,000 feet~~ above the Atoka formation.

(10) That existing State of New Mexico and Federal Regulations relating to casing and cementing of wells will assure that development of the Atoka formation will not adversely affect said ~~water zones~~ *aquifers*.

(11) That the Atoka formation, or any portion thereof, as described herein, is not currently being developed by infill drilling as defined in 18 C.F.R. §271.703(b)(6) of the regulations.

(12) That the Atoka formation within the proposed area should be recommended to the Federal Energy Regulatory Commission for designation as a tight formation.

IT IS THEREFORE ORDERED:

(1) That it be and hereby is recommended to the Federal Energy Regulatory Commission pursuant to Section 107 of the Natural Gas Policy Act of 1978, and 18 C.F.R. §271.703 of the regulations that the Atoka formation underlying the following described lands in Lea County, New Mexico, be designated as a tight formation:

Sections 33 through 36 : A11

Township 12 South, Range 36 East, N.M.P.M.

Section 31 : A11

Township 13 South, Range 35 East, N.M.P.M.

Sections 1 through 4 : A11

Sections 9 through 16 : A11

Sections 21 through 28 : A11

Sections 33 through 36 : A11

Township 13 South, Range 36 East, N.M.P.M.

Sections 6 and 7 : A11

Sections 18 through 20 : A11

Sections 29 through 32 : A11

Township 14 South, Range 35 East, N.M.P.M.

Sections 1 through 4 : A11

Sections 9 through 16 : A11

Sections 21 through 24 : A11

~~Sections~~

Township 14 South, Range 36 East, N.M.P.M.

Sections 5 through 7 : A11

Sections 18 and 19 : A11

Containing a total of 37,760 acres, more or less.

(2) That jurisdiction of this cause is hereby retained for the entry of such further orders as the Division may deem necessary.

DONE at Santa Fe, New Mexico, on the day and year hereinabove described.

IN THE MATTER OF THE APPLICATION :
OF HARVEY E. YATES COMPANY FOR :
DESIGNATION OF A TIGHT FORMATION :
LEA COUNTY, NEW MEXICO :

Case No. 7085

APPLICATION

COMES NOW HARVEY E. YATES COMPANY by its attorney and respectfully states;

1. Applicant is the owner of an interest in the Atoka formation underlying the following described lands situated in Lea County, New Mexico:

Township 12 South, Range 35 East, N.M.P.M.
Sections 33, 34, 35, 36

Township 13 South, Range 35 East, N.M.P.M.
Sections 1, 2, 3, 4, 9, 10, 11, 12, 13,
14, 15, 16, 21, 22, 23, 24, 25,
26, 27, 28, 33, 34, 35, 36

Township 14 South, Range 35 East, N.M.P.M.
Sections 1, 2, 3, 4, 9, 10, 11, 12, 13,
14, 15, 16, 21, 22, 23, 24

Township 12 South, Range 36 East, N.M.P.M.
Section 31

Township 13 South, Range 36 East, N.M.P.M.
Sections 6, 7, 18, 19, 20, 29, 30, 31, 32

Township 14 South, Range 36 East, N.M.P.M.
Sections 5, 6, 7, 18, 19

Containing a total of 37,760 acres more or less.

2. The Atoka formation underlying the above described lands is expected to have an estimated average in situ gas permeability throughout the pay section of less than 0.1 millidarcy.

3. The stabilized production rate, against atmospheric pressure of wells completed for production in said formation, without stimulation, is not expected to exceed the production levels set out in 18 C.F.R. §271.703 (c)(2)(B).

4. No well drilled into said formation is expected to produce, without stimulation, more than five barrels of crude oil per day.

WHEREFORE, applicant prays:

A. That this application be set for hearing before an examiner, and that notice of said hearing be given as required by law.

B. That upon such hearing, the Division enter its order recommending to the Federal Energy Regulatory Commission that pursuant to 18 CFR, Section 271.701-705, the Atoka formation underlying the above described lands be designated a tight formation.

C. For such further relief as the Division deems just and proper.

DATED this 21st day of October, 1980.

Applicant Exhibit Four, Report	16

1
2 MR. STAMETS: We'll call Case 7085.

3 MR. PADILLA: Application of Harvey E.
4 Yates Company for a designation of tight formation, Lea
5 County, New Mexico.
6

7 MR. STAMETS: I'll ask for appearances
8 in this case.

9 MR. STRAND: Mr. Examiner, Robert H.
10 Strand, attorney from Roswell, appearing for the applicant,
11 Harvey E. Yates Company; and I'll have two witnesses who need
12 to be sworn.
13

14 MR. STAMETS: I'd like to have both
15 stand and be sworn at this time, please.

16 (Witnesses sworn.)
17

18
19 MR. STRAND: Mr. Examiner, Harvey E.
20 Yates Company is applicant in Case Number 7085 and is re-
21 questing the Division to recommend to the Federal Energy Regu-
22 latory Commission that the Atoka formation underlying appro-
23 ximately 37,760 acres in Township 12 South, 13 South, 14 South,
24 all in Range 35 East, Township 12 South, Township 13 South,
25 Township 14 South, in Range 36 East, as more particularly
26 described in the application which has been filed in this
27 matter, all in Lea County, New Mexico, be designated as a
28

1
2 tight formation, pursuant to Section 107 of the Natural Gas
3 Policy Act of 1978, and 18 CFR Section 271.701-705.
4

5
6 ANDREW LATTU

7 being called as a witness and being duly sworn upon his oath,
8 testified as follows, to-wit:
9

10 DIRECT EXAMINATION

11 BY MR. STRAND:

12 Q Will you please state your name for the
13 record?
14

15 A Andrew Lattu.

16 Q Mr. Lattu, where do you reside and what
17 is your occupation?

18 A I'm a geologist. I live in Midland,
19 Texas, and I work for Harvey E. Yates Company.

20 Q Mr. Lattu, have you testified before the
21 Division in the past and are your qualifications a matter of
22 record?
23

24 A Yes, I have and they are.

25 MR. STRAND: Mr. Examiner, is Mr. Lattu
26 considered qualified as an expert geologist?

27 MR. STAMETS: Yes.

28 Q Mr. Lattu, are you familiar with the

1
2 application in Case Number 7065, which I have just described,
3 and have you prepared certain exhibits for presentation at
4 this hearing?

5
6 A Yes, I have.

7 Q Will you please briefly describe each of
8 these exhibits and how they relate to the application?

9 A Yes, I will. Exhibit Number One is a
10 geologic structure map contoured on the top of the Devonian
11 in Lea County, New Mexico. The contour interval is 100 feet.
12 The map scale is one inch equals 8000 feet. This is from a
13 commercially prepared structure map by GeoMap Corporation.
14

15 There is also indicated on this map a
16 cross section A-A', which will be Exhibit Number Three.

17 This exhibit shows the, the Devonian
18 structure map shows the basic geologic structure within the
19 area of Lea County.

20 Q Mr. Lattu, would you briefly describe
21 Exhibit Number Two?

22 A Exhibit Number Two is a sand/shale ratio
23 map of the Atoka formation in the area of this application.
24 The Atoka section, the Atoka interval in this particular area
25 is essentially mostly shales and it has some thin bedded limes
26 and some sands within this interval, and the interval varies
27 from 700 to 900 feet in thickness.
28

1
2 And as these percent lines show, the
3 map scale here is contour interval of five percent and a hor-
4 izontal scale of one inch equals 4000 feet.

5
6 As you can see, the best developed sands
7 in this area are only 17 to 18 percent of the Atoka interval.
8 And this map shows more or less the depositional grain of
9 where these sands are expected to be encountered, the higher
10 percentage, of course, having more sands and therefor more
11 prospective.

12 This exhibit is most of the basis for
13 the outline of the area we have requested; that we feel with-
14 in this area is the area where we expect to find the Atoka
15 formation productive.

16
17 Q Mr. Lattu, for the record will you ex-
18 plain in a little more detail just exactly what a sand/shale
19 ratio map is?

20 A Well, you take the entire interval and
21 divide the net number of feet of sand by the net number of
22 feet of shale.

23 Q And the contour lines such as you have
24 on the map pictorially represent these ratios, is that correct?
25

26 A Yes, they do.

27 MR. STAMETS: What we're looking at,
28 then, when you -- on your 15 foot contour line --

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20
21
22
23
24
25
26
27
28

A It's 15 percent.

MR. STAMETS: 15 percent, so in 100 feet --

A You'd have 15 feet of sand; of course, if you had 1000 feet, 150 feet.

MR. STAMETS: What about your line sections? Are those tossed out or is that included?

A No, they're not included. Of course, sometimes it's a little difficult to tell a sand from a lime just from electric logs, but using all the data available, we eliminated the limes and just used the sands and the shales.

Q Mr. Lattu, would you please describe Exhibit Number Three?

A Yes. Exhibit Number Three is a cross section, as indicated both on Exhibit Number One and Exhibit Number Two as A-A'.

This cross section A-A' contains eighteen wells, all of which are both near and within the boundaries of our requested area for this hearing. Only one well has been left out and that is down in Section 19 of 14, 36, which is right on the eastern boundary of the requested area. Now this well was still being drilled and hadn't been logged at the time this exhibit was prepared. The Atoka sands were found nonproductive in that well, both by drill stem test and by log analysis, and we do have copies of that log available

1
2 if they're requested.

3 But other than that one exception, every
4 well within this area that penetrated the Atoka formation is
5 on this cross section.
6

7 Of all these wells only one has been
8 commercially productive at this time, and that is well number
9 twelve, the Harvey E. Yates No. 1 Detonbough in Section 32
10 of Township 13 South, Range 36 East.

11 Within this well we perforated five
12 separate sands in the Atoka formation for a net of 72 net
13 feet sand included in these perforations. Gross sand was
14 naturally much more than that. We were perforating the sands
15 that appeared productive by log analysis and drilling shows
16 and drill stem test.
17

18 Q Mr. Lattu, what is the gross thickness
19 of the Atoka formation which you have outlined on your cross
20 section, on the average?

21 A On the average, it varies from 700 to
22 nearly 900 feet. When you get up on top of very steep struc-
23 tures the Atoka formation thins, as in the case of this Union
24 of Texas, Petroleum Corporation, Shell State No. 1 in Section
25 6 of Township 13 South, Range 35 East, in which case it's ap-
26 proximately 440 feet thick.
27

28 Otherwise, it's about 700 to 900 feet.

1
2 The Atoka formation in this area, a little geologic history,
3 this is a fairly shallow, slowly subsiding basin. You had
4 essentially quiet waters. Sands and shales were periodically
5 washed out in this area from exposed rocks, both to the north
6 and to the west. And these sands were probably winnowed and
7 accumulated by along shore currents and possible tidal action
8 or wave action into a series of bars. And these bars occur
9 throughout the Atoka formation in this area.
10

11 The sands within these bars is fine
12 grained to medium grained sand; it's slightly calcareous; some
13 of them are very silty, and a few, of course, where you can
14 catch the center of one of these bars, are quite clean and
15 show good porosity.
16

17 Q Mr. Lattu, in this application we are
18 requesting that the entire Atoka formation as you've outlined
19 it on your cross section be designated a tight formation, is
20 that correct?

21 A Yes, it is.

22 Q But am I correct that what you're saying
23 is that within this gross interval of 700 to 900 feet, that
24 you have varying thicknesses of sands interspersed with
25 shale, as shown on your sand/shale ratio map?
26

27 A Yes. The -- the sands tend to be best
28 concentrated down, as the sand/shale ratio map shows, through

1
2 the center or the heart of the area requested, however, I
3 feel several -- because these sands are divided over such a
4 thick section, you could have an area with only, say, 8 per-
5 cent sand in the interval, but if you had 20 feet of sand, it
6 would still be productive.
7

8 But because of the nature of this and
9 this geology, or the history of this area, is fairly uniform
10 through this period of time, these bars are scattered verti-
11 cally up and down through the section in any one well.

12 Q Mr. Lattu, on the average what is the
13 depth from the surface to the top of the Atoka formation
14 underlying this area?
15

16 A Okay, within the area we're requesting
17 the tight reservoir designation for, it is approximately
18 12,200 feet.

19 Q Mr. Lattu, based on your analysis of
20 the -- of the geology of this formation, in your opinion does
21 it underly all of the area requested for tight formation?
22

23 A Yes, it does.

24 Q And to backtrack just a bit, on Exhibit
25 Number Two the outline of the requested area is set out in
26 a heavy crosshatched line.

27 A Yes. It's -- it's indicated by a heavy
28 line, with heavy lines and little dots.

1
2 Q Is it further your opinion that the
3 Atoka formation which you've described is at least potentially
4 productive under the entire area?

5 A Yes, I believe it is.

6 Q Mr. Lattu, would you please describe
7 the fresh water aquifers that underlie the area proposed for
8 designation?
9

10 A The fresh water aquifers are the Santa
11 Rosa and the Ogalallah. ^{Ogalallah} The ~~Santa Rosa~~ is at a depth of from
12 300 to 400 feet and the ^{Santa Rosa} Ogalallah would be at a depth of 900
13 to 1200 feet.

14 Q Do these fresh water aquifers occur
15 quite uniformly under this area?
16

17 A Fairly uniformly, yes.

18 Q Are you familiar with the rules and
19 policies of the Oil Conservation Division relating to casing
20 and cementing programs for wells which would be drilled into
21 the Atoka formation in this area?

22 A Yes, I am.

23 Q In your opinion would carrying out of
24 such casing and cementing programs adequately protect these
25 fresh water aquifers from contamination?
26

27 A Yes, it will.

28 Q Mr. Lattu, were Exhibits One through

1
2 Three prepared by you or under your supervision?

3 A Yes, they were.

4 MR. STRAND: That's all I have for Mr.
5 Lattu.
6

7
8 CROSS EXAMINATION

9 BY MR. STAMETS:

10 Q Mr. Lattu, I may have missed it, I be-
11 lieve you did say, or at least I interpreted, the dashed out-
12 line on Exhibit Number Two to be the area that has been re-
13 quested here.

14 A Yes.

15 Q Okay.
16

17 MR. STRAND: Mr. Examiner, the exact
18 legal description is set out in the application.

19 MR. STAMETS: All right, but for pur-
20 poses of cross examination, and whatnot, I want to be able
21 to relate that to what I saw on Exhibit Two.

22 Talking about lime zones awhile ago,
23 your analysis of the depositional environment would seem to
24 limit any lime zones to relatively thin stringers as opposed
25 to major reef buildup in this area.
26

27 A Yes, it would. The Atoka formation
28 where these large carbonate and reef development occurs are

1
2 much further south; approximately down near the Texas-New
3 Mexico border.

4 Q Would you approve a type log for this
5 area?
6

7 A We should probably pick a well that's
8 producing and in that case it would be the Harvey E. Yates
9 No. 1 Betenbough in Section 32 of 13, 36.

10 Q Okay. What -- do you have the top and
11 bottom of the Atoka there?

12 A Let's see, I can read them off the
13 cross section. That is well number twelve on the cross section,
14 and the top of the Atoka appears to be about 12,230 and the
15 base of the Atoka formation will be 12,970.
16

17 MR. STAMETS: Are there any other ques-
18 tions of Mr. Lattu?

19 MR. PADILLA: I've got one or two.
20

21 CROSS EXAMINATION

22 BY MR. PADILLA:

23 Q Mr. Lattu, did I understand you to say
24 that only the Betenbough No. 1 was producing from the Atoka
25 formation?
26

27 A Yes, it is the only one that has been
28 producing.

1
2 Texas Crude-Sinclair Oil and Gas-Richardson 5 No.
3 1 attempted a completion that did not produce.

4 Q Has any other well in the subject area
5 produced from the Atoka formation in the time that you've
6 observed this?
7

8 A Not to my knowledge at all.

9 Q Do you know whether the Atoka formation
10 has been tested specifically in the subject area?

11 A It's been tested, of course, by pro-
12 duction from our No. 1 Betenbough and by drill stem tests on
13 some recent wells we have drilled.
14

15 Q But historically, well, historically
16 has the Atoka formation been considered a -- not a prospective
17 formation in this area?

18 A Not in this -- not in this immediate
19 area, no.

20 MR. PADILLA: I have no further questions.

21 MR. STANETS: Any other questions of
22 this witness? He may be excused.

23 MR. STANETS: Mr. Examiner, we'll call
24 Mr. Ralph Viney as our next witness.
25
26
27
28

RALPH VINEY

being called as a witness and being duly sworn upon his oath,
testified as follows, to-wit:

DIRECT EXAMINATION

BY MR. STRAND:

Q State your full name for the record.

A My name is Ralph Viney.

Q Mr. Viney, where do you reside and what
is your occupation?

A I'm an engineering consultant. I reside
in Midland.

Q Mr. Viney, have you been retained by
Harvey E. Yates Company to present testimony in Case Number
70857

A Yes, sir.

Q Mr. Viney, have you testified before
the Division in the past and are your qualifications a matter
of record?

A Yes, sir.

MR. STRAND: Mr. Examiner, is Mr. Viney
considered qualified as a petroleum engineer?

MR. STAMETS: Yes.

Q Mr. Viney, are you familiar with the

1 application in Case Number 7035?

2 A Yes, sir.

3 Q And in that regard have you prepared
4 a set of exhibits relating to the engineering aspects of this
5 application, which we have designated as Exhibit Number Four?
6

7 A Yes, sir.

8 Q Referring to Exhibit Four-1, would you
9 please -- which is a summary of the basic data for each of
10 the wells set out thereon, will you please describe the perme-
11 ability calculations which you've arrived at, and the sup-
12 porting data?
13

14 A Yes, sir, I will note that the two
15 wells are considered: A drill stem test, and a reservoir
16 build-up, and a drill stem test of a second well.

17 The permeability calculations are deter-
18 mined by a normal Horner build-up pressure -- reservoir pres-
19 sure build-up technique, and as you are aware, in the case
20 of drill stem tests the actual flow conditions are then related
21 to the actual pressure conditions during a shut-in period and
22 that pressure extrapolated to a dimensionless point and from
23 that the permeability and drainage radius calculations can
24 be made.
25

26 Q Mr. Viney, would you describe the re-
27 sults of these calculations with respect to each of the wells
28 you have listed on the exhibit?

1
2 A Yes, sir. In the case of the Betenbough
3 Well No. 1 drill stem test data, you will note that the flow
4 rate on this particular test was approximately 102 Mcf and
5 the calculated permeability by extrapolating the pressures and
6 using that data indicated a permeability of 0.025 millidarcy.
7

8 In the case of the reservoir build-up
9 test which was conducted after production from the Betenbough
10 Well, the test rate at the -- the flow rate prior to shutting
11 in and taking the reservoir build-up test was about 833 Mcf
12 per day, and this well was shut in for a considerable period
13 of time as you will notice in the data, and the permeability
14 calculated using this data was .0767.
15

16 It should be noted that the Betenbough
17 reservoir pressure build-up is after the well stimulation.
18 This well was acidized, produced, and the results then analyzed
19 and compared.

20 The third tabulation represents the
21 findings of a drill stem test on the Harvey E. Yates Superior
22 19 State No. 1 Well.
23

24 You will note that the flow rate in drill
25 stem test is 305 Mcf a day and the permeability was 0.01 of
26 a millidarcy.

27 Q Mr. Viney, would you discuss the pay
28 section involved that these calculations were based on in

1
2 the Batenbough No. 1 Well?

3 A Yes, sir. For the purposes of arriving
4 at a capacity or permeability footage value we used 72 feet
5 of pay section.
6

7 Q Does that 72 feet of pay section basi-
8 cally represent the perforated interval of the well?

9 A Nearly, yes, sir.

10 Q And you heard Mr. Lattu's testimony
11 previously as to the characteristics of this Atoka formation
12 with various sands interspersed with shale. You did not con-
13 sider in your permeability calculation on this well these
14 other sands within this interval of 12,175 to 12,347?
15

16 A No, sir, we only selected the high poro-
17 sity appearing sands.

18 Q Mr. Viney, considering Mr. Lattu's
19 geological testimony and your permeability analysis, is it
20 your opinion that the Atoka formation underlying the area
21 proposed for designation would be expected to have an estimated
22 average in situ gas permeability of less than 0.1 millidarcy
23 throughout the pay section?
24

25 A Based on this evidence, yes, sir.

26 MR. STAMETS: Mr. Viney, considering
27 only the -- what you considered the higher permeability sands,
28 would that have a tendency to increase or decrease the perme-

1
2 ability figure that you arrive at?

3 A By using the lower thickness figure,
4 it would tend to give a maximum permeability that could be
5 expected.
6

7 MR. STAMETS: So if you considered the
8 entire interval, you would have even a lower number.

9 A It would probably be by a factor of 10
10 percent of this figure if you used the entire section, yes,
11 sir.

12 MR. STAMETS: Okay, thank you.

13 Q Mr. Viney, referring back to Exhibit
14 Four-1, would you please describe your analysis and calcula-
15 tions relating to production rates against atmospheric pres-
16 sure?
17

18 A Yes, sir. The flow rates, as shown on
19 the bottom of the exhibit, Four-1, are normal rates that you
20 would arrive at using a radial flow Darcy equation, which is
21 the standard equation used basically in all fluid flow measure-
22 ments. And you will note that with the radius of investiga-
23 tion during the test, why, none of the wells would exceed --
24 or none of the flow rates of any of these tests would exceed
25 more than 1215 Mcf per day.
26

27 Q Mr. Viney, have you also included as
28 Exhibit Four-2 a general statistical summary of production

1
2 from the Betenbough No. 1 Well?

3
4 A. Yes, sir.

5 Q And to what date does that summary con-
6 tain information on production?

7 A The summary in the exhibit is through
8 November -- I mean, September 3rd.

9 Q Have you also reviewed production figures
10 from this well since that date and are they comparable?

11 A Yes, sir, they are.

12 MR. STRAND: Mr. Examiner, we do have
13 copies of those additional figures if you feel they're ne-
14 cessary.
15

16 MR. STAMETS: Okay.

17 Q Mr. Viney, what is the status of the
18 Superior 19 State No. 1 Well?

19 A The Superior State No. 19-1 is tempo-
20 rarily abandoned and possibly can be re-entered at a later
21 date.
22

23 Q But there is no production history from
24 that well?

25 A No, sir, other than the drill stem test.

26 Q Mr. Viney, based on your analysis of
27 this data, is it your opinion that the stabilized production
28 rate against atmospheric pressure of wells which might be com-

1
2 pleted for production in the Atoka formation we've been dis-
3 cussing without any type of stimulation would not be expected
4 to exceed 1238 Mcf per day?

5 A Yes, sir, the probable rate would be
6 300 to 400 Mcf a day without stimulation.
7

8 Q And is it also your opinion that this
9 would be true generally throughout the area proposed for
10 designation?

11 A Yes, sir, we would assume this would
12 hold.
13

14 Q Mr. Viney, referring to Exhibit Number
15 Four and the various types of information you have in there,
16 will you please describe the liquids produced from the forma-
17 tion and your conclusions as to their physical state in the
18 reservoir?

19 A Yes, sir. The liquids as being pro-
20 duced are a light-colored, straw-colored liquid. The weather
21 (sic) gravity is approximately 46 degrees. We do not have
22 a recombination of the fluid samples at surface; however,
23 looking at the shape and performance of the build-up curves,
24 it would appear that we have a phase change at approximately
25 3560 pounds in the tubing liquids -- of the liquids in the
26 tubing, which would indicate with reason a dewpoint of appro-
27 ximately 3500 to 3600 pounds. Consequently, all liquids at
28

1
2 higher pressures would exist, all fluids would exist in a
3 single phase in the reservoir.
4

5 Q And what phase would that be?

6 A That would be a gas phase.

7 Q And that -- would that be the status of
8 the reservoir at the present time or at least at the time the
9 well was completed?

10 A Yes, sir.

11 Q What is the current pressure? Do you
12 have that information?

13 A Yes, sir, the current pressure as stated
14 on the build-ups, which will be Exhibit Four-1(b), is 4279
15 pounds. That is page five, Mr. Stamets.
16

17 Q Mr. Viney, is it then your opinion that
18 this liquids would be considered condensate as condensate is
19 normally defined as --

20 A Yes, sir.

21 Q -- opposed to crude oil?

22 A It would be a retrograde condensate in
23 all probability.
24

25 Q Would it also then be your opinion that
26 there would not be any crude oil produced from the proposed
27 tight formation?

28 A There is no crude in the reservoir so

1
2 none can be produced; it would all be condensate.

3 Q Mr. Viney, referring to Exhibit Four-3,
4 does this exhibit set out, together with other information,
5 the casing and cementing program utilized in the Betenbough
6 No. 1 Well?
7

8 A Yes, sir.

9 Q In your opinion would this type of pro-
10 gram adequately protect the fresh water aquifers described by
11 Mr. Lattu?
12

13 A Yes, sir. You will note that the sur-
14 face casing is set through 369 and cemented and the inter-
15 mediate string of 9-5/8ths is set through 4600, adequately
16 protecting both the 900 to 1200 and the 300 to 400 water zones.

17 Q To your knowledge, Mr. Viney, does this
18 casing and cementing program conform with the regulations and
19 policies of the Oil Conservation Division relating to this
20 field?
21

22 A As I understand it, yes, sir.

23 Q And in your opinion would compliance
24 generally with rules -- with their rules for this type of well
25 protect the fresh water aquifers?
26

27 A Yes, sir.

28 Q Mr. Viney, with regard to various types
of treatment programs which might be employed for the wells to

1
2 be completed in the Atoka formation, in your opinion would
3 they have any adverse affect on the fresh water aquifers?

4 A. They should not if the casing is properly
5 cemented, no, sir.
6

7 Q Was Exhibit Number Four prepared by you
8 or under your supervision?

9 A Yes, sir.

10 MR. STRAND: Mr. Examiner, I move the
11 admission of Exhibits One through Four.

12 MR. STAMETS: Exhibit Number -- all the
13 exhibits are accepted.
14

15 MR. STRAND: And that's all I have of
16 Mr. Viney on direct.

17 MR. STAMETS: Are there questions of
18 Mr. Viney? Mr. Padilla.
19

20 CROSS EXAMINATION

21 BY MR. PADILLA:

22 Q I'm not sure whether Mr. Viney can an-
23 swer this question. It's of a general nature. Even you, Mr.
24 Strand.
25

26 Is any area, or the subject area being
27 currently developed by infill drilling as defined in the
28 rules and regulations?

1
2 MR. STRAND: No, not to my knowledge.

3 A Not to our knowledge, no, sir.

4 Q Mr. Viney, what type of stimulation
5 techniques would be required in addition to acidizing for the
6 Atoka formation? Would any other type of technique be re-
7 quired?
8

9 A Since none have been done, Mr. Padilla,
10 a fracture treatment would appear very suitable for this type
11 of formation, but since we don't know what it would -- how
12 it would react, I cannot say, but if we take engineering tech-
13 nique, yes, a fracture treatment could possibly increase the
14 productivity of these wells.
15

16 Q Do you estimate that stimulation will be
17 required in all the wells drilled to the Atoka?

18 A I would say that you'd at least have to
19 have acid cleanup work, or some acid work, to clean up your --
20 some possible mud filtrate around the wellbore, yes, sir.

21 Q What I'm trying to get at is would you
22 necessarily require massive stimulation for the Atoka formation
23 in the subject area?
24

25 A I'm not going to say you would require
26 it. It may be desireable, yes, sir.

27 MR. STRAND: Mr. Viney, isn't the treat-
28 ment programs that you would employ on these types of wells

1
2 something that would have to be determined from each indivi-
3 dual well, logs and tests, and so forth?

4 A Well, on the flow rates you'd want to
5 look at your initial flow rate prior to stimulation, and your
6 flow rate after a massive clean-up, and then from that point
7 I think, Mr. Padilla, you could possibly generalize and say
8 I'd want to go to a larger treatment, whether it be acid, or
9 acid frac, or some type of propping fracture method.
10

11 MR. STRAND: Mr. Viney, can you conceive
12 of any type of fracturing program, be it however exotic, which
13 would cause any kind of problem with the fresh water aquifers?
14

15 A No, sir, there should be no problem.
16 Again this will depend upon the cementing condition around
17 the producing zones, and if properly cemented should not
18 migrate 10 or 12,000 feet.

19 Q Another general question. Where is the
20 subject located in relation to --- to the closest towns in Lea
21 County?
22

23 A Tatum, I guess, would be ---

24 MR. STRAND: Yeah, well, approximately ---

25 A McDonald and Tatum, I guess.

26 MR. STRAND: Approximately 10 miles
27 south of Tatum. So really the area proposed for designation,
28 the northern boundary would be approximately 2-1/2 to 3 miles

1 southwest of Tatum.

2
3 MR. PADILLA: I have nothing else.

4
5 CROSS EXAMINATION

6
7 BY MR. STAMETS:

8 Q Mr. Viney, the two sets of calculations
9 that you run through to show in situ permeability --

10 A Yes, sir.

11 Q -- are both located on the eastern edge
12 of the area --

13 A Yes, sir.

14 Q -- and fairly close together. Why do
15 you feel that we should expect to see this same permeability
16 apply to this somewhat larger area?

17
18 A Based on the geological information
19 developed, Mr. Stamets, and the conditions that appear through-
20 out the sections of the logs, the conditions of the deposition
21 appear almost identical.

22 I can't answer that it will occur be-
23 cause I don't know, but based on the interpretation of the
24 sands and the -- in other wells and in the wells that we
25 tested, they appear very identical or very similar.

26
27 MR. STRAND: Would that same permeability
28 factor be expected to occur?

1
2 A. Based on what we have seen, the condi-
3 tions and the sands appear the same, you would have to make
4 that conclusion based on the evidence at hand.
5

6 MR. STAMETS: Any other questions of
7 the witness? He may be excused.

8 Anything further in this case?

9 MR. STRAND: Nothing further, Mr. Exa-
10 miner.

11 MR. STAMETS: If there is nothing fur-
12 ther, the case will be taken under advisement.

C E R T I F I C A T E

I, SALLY W. BOYD, C.S.R., DO HEREBY CERTIFY that
the foregoing Transcript of Hearing before the Oil Conserva-
tion Division was reported by me; that the said transcript
is a full, true, and correct record of the hearing, prepared
by me to the best of my ability.

I do hereby certify that the foregoing is
a complete record of the proceedings in
the Examiner hearing of Case No. _____
heard by me on _____ 19____.

_____, Examiner
Oil Conservation Division

Applicant Exhibit Four, Report	16

1
2 MR. STAMETS: We'll call Case 7085.

3 MR. PADILLA: Application of Harvey E.
4 Yates Company for a designation of tight formation, Lea
5 County, New Mexico.
6

7 MR. STAMETS: I'll ask for appearances
8 in this case.

9 MR. STRAND: Mr. Examiner, Robert H.
10 Strand, attorney from Roswell, appearing for the applicant,
11 Harvey E. Yates Company; and I'll have two witnesses who need
12 to be sworn.

13 MR. STAMETS: I'd like to have both
14 stand and be sworn at this time, please.

15
16
17 (Witnesses sworn.)
18

19 MR. STRAND: Mr. Examiner, Harvey E.
20 Yates Company is applicant in Case Number 7085 and is re-
21 questing the Division to recommend to the Federal Energy Regu-
22 latory Commission that the Atoka formation underlying approx-
23 imately 37,760 acres in Township 12 South, 13 South, 14 South,
24 all in Range 35 East, Township 12 South, Township 13 South,
25 Township 14 South, in Range 36 East, as more particularly
26 described in the application which has been filed in this
27 matter, all in Lea County, New Mexico, be designated as a
28

1
2 tight formation, pursuant to Section 107 of the Natural Gas
3 Policy Act of 1978, and 18 CFR Section 271.701-705.
4

5
6 ANDREW LATTU

7 being called as a witness and being duly sworn upon his oath,
8 testified as follows, to-wit:

9
10 DIRECT EXAMINATION

11 BY MR. STRAND:

12 Q Will you please state your name for the
13 record?
14

15 A Andrew Lattu.

16 Q Mr. Lattu, where do you reside and what
17 is your occupation?

18 A I'm a geologist. I live in Midland,
19 Texas, and I work for Harvey E. Yates Company.

20 Q Mr. Lattu, have you testified before the
21 Division in the past and are your qualifications a matter of
22 record?
23

24 A Yes, I have and they are.

25 MR. STRAND: Mr. Examiner, is Mr. Lattu
26 considered qualified as an expert geologist?

27 MR. STAMETS: Yes.

28 Q Mr. Lattu, are you familiar with the

1
2 application in Case Number 7085, which I have just described,
3 and have you prepared certain exhibits for presentation at
4 this hearing?

5
6 A. Yes, I have.

7 Q. Will you please briefly describe each of
8 these exhibits and how they relate to the application?

9 A. Yes, I will. Exhibit Number One is a
10 geologic structure map contoured on the top of the Devonian
11 in Lea County, New Mexico. The contour interval is 100 feet.
12 The map scale is one inch equals 8000 feet. This is from a
13 commercially prepared structure map by GeoMap Corporation.
14

15 There is also indicated on this map a
16 cross section A-A', which will be Exhibit Number Three.

17 This exhibit shows the, the Devonian
18 structure map shows the basic geologic structure within the
19 area of Lea County.

20 Q. Mr. Iattu, would you briefly describe
21 Exhibit Number Two?

22 A. Exhibit Number Two is a sand/shale ratio
23 map of the Atoka formation in the area of this application.
24 The Atoka section, the Atoka interval in this particular area
25 is essentially mostly shales and it has some thin bedded limes
26 and some sands within this interval, and the interval varies
27 from 700 to 900 feet in thickness.
28

1
2 And as these percent lines show, the
3 map scale here is contour interval of five percent and a hor-
4 izontal scale of one inch equals 4000 feet.

5
6 As you can see, the best developed sands
7 in this area are only 17 to 18 percent of the Atoka interval.
8 And this map shows more or less the depositional grain of
9 where these sands are expected to be encountered, the higher
10 percentage, of course, having more sands and therefor more
11 prospective.

12
13 This exhibit is most of the basis for
14 the outline of the area we have requested; that we feel with-
15 in this area is the area where we expect to find the Atoka
16 formation productive.

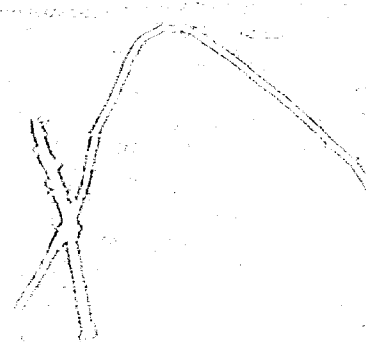

17 Q Mr. Lattu, for the record will you ex-
18 plain in a little more detail just exactly what a sand/shale
19 ratio map is?

20 A Well, you take the entire interval and
21 divide the net number of feet of sand by the net number of
22 feet of shale.

23 Q And the contour lines such as you have
24 on the map pictorially represent those ratios, is that correct?
25

26 A Yes, they do.

27 MR. STAMETS: What we're looking at,
28 then, when you -- on your 15 foot contour line --

24
25
26
27
28

A. It's 15 percent.

MR. STAMETS: 15 percent, so in 100 feet --

A. You'd have 15 feet of sand; of course, if you had 1000 feet, 150 feet.

MR. STAMETS: What about your lime sections? Are those tossed out or is that included?

A. No, they're not included. Of course, sometimes it's a little difficult to tell a sand from a lime just from electric logs, but using all the data available, we eliminated the limes and just used the sands and the shales.

Q. Mr. Lattu, would you please describe Exhibit Number Three?

A. Yes. Exhibit Number Three is a cross section, as indicated both on Exhibit Number One and Exhibit Number Two as A-A'.

This cross section A-A' contains eighteen wells, all of which are both near and within the boundaries of our requested area for this hearing. Only one well has been left out and that is down in Section 19 of 14, 36, which is right on the eastern boundary of the requested area. Now this well was still being drilled and hadn't been logged at the time this exhibit was prepared. The Atoka sands were found nonproductive in that well, both by drill stem test and by log analysis, and we do have copies of that log available

1
2 if they're requested.

3 But other than that one exception, every
4 well within this area that penetrated the Atoka formation is
5 on this cross section.
6

7 Of all these wells only one has been
8 commercially productive at this time, and that is well number
9 twelve, the Harvey E. Yates No. 1 Detenbough in Section 32
10 of Township 13 South, Range 36 East.

11 Within this well we perforated five
12 separate sands in the Atoka formation for a net of 72 net
13 feet sand included in these perforations. Gross sand was
14 naturally much more than that. We were perforating the sands
15 that appeared productive by log analysis and drilling shows
16 and drill stem test.
17

18 Q Mr. Lattu, what is the gross thickness
19 of the Atoka formation which you have outlined on your cross
20 section, on the average?

21 A On the average, it varies from 700 to
22 nearly 900 feet. When you get up on top of very steep struc-
23 tures the Atoka formation thins, as in the case of this Union
24 of Texas, Petroleum Corporation, Shell State No. 1 in Section
25 6 of Township 13 South, Range 35 East, in which case it's ap-
26 proximately 440 feet thick.
27

28 Otherwise, it's about 700 to 900 feet.

1
2 The Atoka formation in this area, a little geologic history,
3 this is a fairly shallow, slowly subsiding basin. You had
4 essentially quiet waters. Sands and shales were periodically
5 washed out in this area from exposed rocks, both to the north
6 and to the west. And these sands were probably winnowed and
7 accumulated by along shore currents and possible tidal action
8 or wave action into a series of bars. And these bars occur
9 throughout the Atoka formation in this area.
10

11 The sands within these bars is fine
12 grained to medium grained sand; it's slightly calcareous; some
13 of them are very silty, and a few, of course, where you can
14 catch the center of one of these bars, are quite clean and
15 show good porosity.
16

17 Q Mr. Lattu, in this application we are
18 requesting that the entire Atoka formation as you've outlined
19 it on your cross section be designated a tight formation, is
20 that correct?

21 A Yes, it is.

22 Q But am I correct that what you're saying
23 is that within this gross interval of 700 to 900 feet, that
24 you have varying thicknesses of sands interspersed with
25 shale, as shown on your sand/shale ratio map?
26

27 A Yes. The -- the sands tend to be best
28 concentrated down, as the sand/shale ratio map shows, through

1
2 the center or the heart of the area requested; however, I
3 feel several -- because these sands are divided over such a
4 thick section, you could have an area with only, say, 2 per-
5 cent sand in the interval, but if you had 20 feet of sand, it
6 would still be productive.
7

8 But because of the nature of this and
9 this geology, or the history of this area, is fairly uniform
10 through this period of time, these bars are scattered verti-
11 cally up and down through the section in any one well.

12 Q Mr. Lattu, on the average what is the
13 depth from the surface to the top of the Atoka formation
14 underlying this area?
15

16 A Okay, within the area we're requesting
17 the tight reservoir designation for, it is approximately
18 12,200 feet.

19 Q Mr. Lattu, based on your analysis of
20 the -- of the geology of this formation, in your opinion does
21 it underly all of the area requested for tight formation?
22

23 A Yes, it does.

24 Q And to backtrack just a bit, on Exhibit
25 Number Two the outline of the requested area is set out in
26 a heavy crosshatched line.

27 A Yes. It's -- it's indicated by a heavy
28 line, with heavy lines and little dots.

1
2 Q Is it further your opinion that the
3 Atoka formation which you've described is at least potentially
4 productive under the entire area?

5 A Yes, I believe it is.

6 Q Mr. Lattu, would you please describe
7 the fresh water aquifers that underlie the area proposed for
8 designation?
9

10 A The fresh water aquifers are the Santa
11 Rosa and the Ogallallah. The Santa Rosa is at a depth of from
12 300 to 400 feet and the Ogallallah would be at a depth of 900
13 to 1200 feet.

14 Q Do these fresh water aquifers occur
15 quite uniformly under this area?

16 A Fairly uniformly, yes.

17 Q Are you familiar with the rules and
18 policies of the Oil Conservation Division relating to casing
19 and cementing programs for wells which would be drilled into
20 the Atoka formation in this area?
21

22 A Yes, I am.

23 Q In your opinion would carrying out of
24 such casing and cementing programs adequately protect these
25 fresh water aquifers from contamination?
26

27 A Yes, it will.

28 Q Mr. Lattu, were Exhibits One through

1
2 Three prepared by you or under your supervision?

3 A Yes, they were.

4 MR. STRAND: That's all I have for Mr.
5 Lattu.
6

7
8 CROSS EXAMINATION

9 BY MR. STAMETS:

10 Q Mr. Lattu, I may have missed it, I be-
11 lieve you did say, or at least I interpreted, the dashed out-
12 line on Exhibit Number Two to be the area that has been re-
13 quested here.

14 A Yes.

15 Q Okay.

16
17 MR. STRAND: Mr. Examiner, the exact
18 legal description is set out in the application.

19 MR. STAMETS: All right, but for pur-
20 poses of cross examination, and whatnot, I want to be able
21 to relate that to what I saw on Exhibit Two.

22 Talking about lime zones awhile ago,
23 your analysis of the depositional environment would seem to
24 limit any lime zones to relatively thin stringers as opposed
25 to major reef buildup in this area.
26

27 A Yes, it would. The Atoka formation
28 where these large carbonate and reef development occurs are

1
2 much further south; approximately down near the Texas-New
3 Mexico border.

4 Q Would you approve a type log for this
5 area?
6

7 A We should probably pick a well that's
8 producing and in that case it would be the Harvey E. Yates
9 No. 1 Betenbough in Section 32 of 13, 36.

10 Q Okay. What -- do you have the top and
11 bottom of the Atoka there?

12 A Let's see, I can read them off the
13 cross section. That is well number twelve on the cross section
14 and the top of the Atoka appears to be about 12,230 and the
15 base of the Atoka formation will be 12,970.
16

17 MR. STAMETS: Are there any other ques-
18 tions of Mr. Lattu?

19 MR. PADILLA: I've got one or two.
20

21 CROSS EXAMINATION

22 BY MR. PADILLA:

23 Q Mr. Lattu, did I understand you to say
24 that only the Betenbough No. 1 was producing from the Atoka
25 formation?
26

27 A Yes, it is the only one that has been
28 producing.

1
2 Texas Crude-Sinclair Oil and Gas-Richardson 5 No.
3 1 attempted a completion that did not produce.

4 Q Has any other well in the subject area
5 produced from the Atoka formation in the time that you've
6 observed this?
7

8 A Not to my knowledge at all.

9 Q Do you know whether the Atoka formation
10 has been tested specifically in the subject area?

11 A It's been tested, of course, by pro-
12 duction from our No. 1 Betenbough and by drill stem tests on
13 some recent wells we have drilled.
14

15 Q But historically, well, historically
16 has the Atoka formation been considered a -- not a prospective
17 formation in this area?

18 A Not in this -- not in this immediate
19 area, no.

20 MR. PADILLA: I have no further questions.

21 MR. STAMETS: Any other questions of
22 this witness? He may be excused.

23 MR. STAMETS: Mr. Examiner, we'll call
24 Mr. Ralph Viney as our next witness.
25
26
27
28

RALPH VINEY

being called as a witness and being duly sworn upon his oath,
testified as follows, to-wit:

DIRECT EXAMINATION

BY MR. STRAND:

Q State your full name for the record.

A My name is Ralph Viney.

Q Mr. Viney, where do you reside and what
is your occupation?

A I'm an engineering consultant. I reside
in Midland.

Q Mr. Viney, have you been retained by
Harvey E. Yates Company to present testimony in Case Number
7085?

A Yes, sir.

Q Mr. Viney, have you testified before
the Division in the past and are your qualifications a matter
of record?

A Yes, sir.

MR. STRAND: Mr. Examiner, is Mr. Viney
considered qualified as a petroleum engineer?

MR. STAMETS: Yes.

Q Mr. Viney, are you familiar with the

1 application in Case Number 7085?

2 A Yes, sir.

3 Q And in that regard have you prepared
4 a set of exhibits relating to the engineering aspects of this
5 application, which we have designated as Exhibit Number Four?
6

7 A Yes, sir.

8 Q Referring to Exhibit Four-1, would you
9 please -- which is a summary of the basic data for each of
10 the wells set out thereon, will you please describe the perme-
11 ability calculations which you've arrived at, and the sup-
12 porting data?
13

14 A Yes, sir, I will note that the two
15 wells are considered: A drill stem test, and a reservoir
16 build-up, and a drill stem test of a second well.

17 The permeability calculations are deter-
18 mined by a normal Horner build-up pressure -- reservoir pres-
19 sure build-up technique, and as you are aware, in the case
20 of drill stem tests the actual flow conditions are then related
21 to the actual pressure conditions during a shut-in period and
22 that pressure extrapolated to a dimensionless point and from
23 that the permeability and drainage radius calculations can
24 be made.
25

26 Q Mr. Viney, would you describe the re-
27 sults of these calculations with respect to each of the wells
28 you have listed on the exhibit?

1
2 P. Yes, sir. In the case of the Betenbough
3 Well No. 1 drill stem test data, you will note that the flow
4 rate on this particular test was approximately 102 Mcf and
5 the calculated permeability by extrapolating the pressures and
6 using that data indicated a permeability of 0.025 millidarcy.
7

8 In the case of the reservoir build-up
9 test which was conducted after production from the Betenbough
10 Well, the test rate at the -- the flow rate prior to shutting
11 in and taking the reservoir build-up test was about 833 Mcf
12 per day, and this well was shut in for a considerable period
13 of time as you will notice in the data, and the permeability
14 calculated using this data was .0767.
15

16 It should be noted that the Betenbough
17 reservoir pressure build-up is after the well stimulation.
18 This well was acidized, produced, and the results then analyzed
19 and compared.
20

21 The third tabulation represents the
22 findings of a drill stem test on the Harvey E. Yates Superior
23 19 State No. 1 Well.
24

25 You will note that the flow rate in drill
26 stem test is 305 Mcf a day and the permeability was 0.01 of
27 a millidarcy.
28

Q Mr. Viney, would you discuss the pay
section involved that these calculations were based on in

1
2 the Betenbough No. 1 Well?

3 A Yes, sir. For the purposes of arriving
4 at a capacity or permeability footage value we used 72 feet
5 of pay section.
6

7 Q Does that 72 feet of pay section basi-
8 cally represent the perforated interval of the well?

9 A Nearly, yes, sir.

10 Q And you heard Mr. Lattu's testimony
11 previously as to the characteristics of this Atoka formation
12 with various sands interspersed with shale. You did not con-
13 sider in your permeability calculation on this well these
14 other sands within this interval of 12,175 to 12,347?
15

16 A No, sir, we only selected the high poro-
17 sity appearing sands.

18 Q Mr. Viney, considering Mr. Lattu's
19 geological testimony and your permeability analysis, is it
20 your opinion that the Atoka formation underlying the area
21 proposed for designation would be expected to have an estimated
22 average in situ gas permeability of less than 0.1 millidarcy
23 throughout the pay section?
24

25 A Based on this evidence, yes, sir.

26 MR. STAMETS: Mr. Viney, considering
27 only the -- what you considered the higher permeability sands,
28 would that have a tendency to increase or decrease the perme-

1
2 ability figure that you arrive at?

3 A By using the lower thickness figure,
4 it would tend to give a maximum permeability that could be
5 expected.
6

7 MR. STAMETS: So if you considered the
8 entire interval, you would have even a lower number.

9 A It would probably be by a factor of 10
10 percent of this figure if you used the entire section, yes,
11 sir.

12 MR. STAMETS: Okay, thank you.

13 Q Mr. Viney, referring back to Exhibit
14 Four-1, would you please describe your analysis and calcula-
15 tions relating to production rates against atmospheric pres-
16 sure?
17

18 A Yes, sir. The flow rates, as shown on
19 the bottom of the exhibit, Four-1, are normal rates that you
20 would arrive at using a radial flow Darcy equation, which is
21 the standard equation used basically in all fluid flow measure-
22 ments. And you will note that with the radius of investiga-
23 tion during the test, why, none of the wells would exceed --
24 or none of the flow rates of any of these tests would exceed
25 more than 1215 Mcf per day.
26

27 Q Mr. Viney, have you also included as
28 Exhibit Four-2 a general statistical summary of production

1
2 from the Betenbough No. 1 Well?

3
4 A. Yes, sir.

5 Q. And to what date does that summary con-
6 tain information on production?

7 A. The summary in the exhibit is through
8 November -- I mean, September 3rd.

9 Q. Have you also reviewed production figures
10 from this well since that date and are they comparable?

11 A. Yes, sir, they are.

12 MR. STRAND: Mr. Examiner, we do have
13 copies of those additional figures if you feel they're ne-
14 cessary.
15

16 MR. STAMETS: Okay.

17 Q. Mr. Viney, what is the status of the
18 Superior 19 State No. 1 Well?

19 A. The Superior State No. 19-1 is tempo-
20 rarily abandoned and possibly can be re-entered at a later
21 date.
22

23 Q. But there is no production history from
24 that well?

25 A. No, sir, other than the drill stem test.

26 Q. Mr. Viney, based on your analysis of
27 this data, is it your opinion that the stabilized production
28 rate against atmospheric pressure of wells which might be com-

1
2 plotted for production in the Atoka formation we've been dis-
3 cussing without any type of stimulation would not be expected
4 to exceed 1238 Mcf per day?

5 A Yes, sir, the probable rate would be
6 300 to 400 Mcf a day without stimulation.

7 Q And is it also your opinion that this
8 would be true generally throughout the area proposed for
9 designation?
10

11 A Yes, sir, we would assume this would
12 hold.

13 Q Mr. Viney, referring to Exhibit Number
14 Four and the various types of information you have in there,
15 will you please describe the liquids produced from the forma-
16 tion and your conclusions as to their physical state in the
17 reservoir?
18

19 A Yes, sir. The liquids as being pro-
20 duced are a light-colored, straw-colored liquid. The weather
21 (sic) gravity is approximately 46 degrees. We do not have
22 a recombination of the fluid samples at surface; however,
23 looking at the shape and performance of the build-up curves,
24 it would appear that we have a phase change at approximately
25 3560 pounds in the tubing liquids -- of the liquids in the
26 tubing, which would indicate with reason a dewpoint of appro-
27 ximately 3500 to 3600 pounds. Consequently, all liquids at

higher pressures would exist, all fluids would exist in a single phase in the reservoir.

Q And what phase would that be?

A That would be a gas phase.

Q And that -- would that be the status of the reservoir at the present time or at least at the time the well was completed?

A Yes, sir.

Q What is the current pressure? Do you have that information?

A Yes, sir, the current pressure as stated on the build-ups, which will be Exhibit Four-1(b), is 4279 pounds. That is page five, Mr. Stamets.

Q Mr. Viney, is it then your opinion that this liquids would be considered condensate as condensate is normally defined as --

A Yes, sir.

Q -- opposed to crude oil?

A It would be a retrograde condensate in all probability.

Q Would it also then be your opinion that there would not be any crude oil produced from the proposed tight formation?

A There is no crude in the reservoir so

1 none can be produced; it would all be condensate.

2
3 Q Mr. Viney, referring to Exhibit Four-3,
4 does this exhibit set out, together with other information,
5 the casing and cementing program utilized in the Batembough
6 No. 1 Well?

7
8 A Yes, sir.

9 Q In your opinion would this type of pro-
10 gram adequately protect the fresh water aquifers described by
11 Mr. Lattu?

12 A Yes, sir. You will note that the sur-
13 face casing is set through 369 and cemented and the inter-
14 mediate string of 9-5/8ths is set through 4600, adequately
15 protecting both the 900 to 1200 and the 300 to 400 water zones.

16 Q To your knowledge, Mr. Viney, does this
17 casing and cementing program conform with the regulations and
18 policies of the Oil Conservation Division relating to this
19 field?
20

21 A As I understand it, yes, sir.

22 Q And in your opinion would compliance
23 generally with rules -- with their rules for this type of well
24 protect the fresh water aquifers?
25

26 A Yes, sir.

27 Q Mr. Viney, with regard to various types
28 of treatment programs which might be employed for the wells to

1
2 be completed in the Atoka formation, in your opinion would
3 they have any adverse affect on the fresh water aquifers?

4 A They should not if the casing is properly
5 cemented, no, sir.
6

7 Q Was Exhibit Number Four prepared by you
8 or under your supervision?

9 A Yes, sir.

10 MR. STRAND: Mr. Examiner, I move the
11 admission of Exhibits One through Four.

12 MR. STAMETS: Exhibit Number -- all the
13 exhibits are accepted.
14

15 MR. STRAND: And that's all I have of
16 Mr. Viney on direct.

17 MR. STAMETS: Are there questions of
18 Mr. Viney? Mr. Padilla.
19

20 CROSS EXAMINATION

21 BY MR. PADILLA:

22 Q I'm not sure whether Mr. Viney can an-
23 swer this question. It's of a general nature. Even you, Mr.
24 Strand.
25

26 Is any area, or the subject area being
27 currently developed by infill drilling as defined in the
28 rules and regulations?

1
2 MR. STRAND: No, not to my knowledge.

3 A Not to our knowledge, no, sir.

4 Q Mr. Viney, what type of stimulation
5 techniques would be required in addition to acidizing for the
6 Atoka formation? Would any other type of technique be re-
7 quired?
8

9 A Since none have been done, Mr. Padilla,
10 a fracture treatment would appear very suitable for this type
11 of formation, but since we don't know what it would -- how
12 it would react, I cannot say, but if we take engineering tech-
13 nique, yes, a fracture treatment could possibly increase the
14 productivity of these wells.
15

16 Q Do you estimate that stimulation will be
17 required in all the wells drilled to the Atoka?

18 A I would say that you'd at least have to
19 have acid cleanup work, or some acid work, to clean up your --
20 some possible mud filtrate around the wellbore, yes, sir.

21 Q What I'm trying to get at is would you
22 necessarily require massive stimulation for the Atoka formation
23 in the subject area?
24

25 A I'm not going to say you would require
26 it. It may be desirable, yes, sir.

27 MR. STRAND: Mr. Viney, isn't the treat-
28 ment programs that you would employ on these types of wells

1
2 something that would have to be determined from each indivi-
3 dual well, logs and tests, and so forth?

4 A Well, on the flow rates you'd want to
5 look at your initial flow rate prior to stimulation, and your
6 flow rate after a massive clean-up, and then from that point
7 I think, Mr. Padilla, you could possibly generalize and say
8 I'd want to go to a larger treatment, whether it be acid, or
9 acid frac, or some type of propping fracture method.
10

11 MR. STRAND: Mr. Viney, can you conceive
12 of any type of fracturing program, be it however exotic, which
13 would cause any kind of problem with the fresh water aquifers?
14

15 A No, sir, there should be no problem.
16 Again this will depend upon the cementing condition around
17 the producing zones, and if properly cemented should not
18 migrate 10 or 12,000 feet.

19 Q Another general question. Where is the
20 subject located in relation to -- to the closest towns in Lea
21 County?
22

23 A Tatum, I guess, would be --

24 MR. STRAND: Yeah, well, approximately --

25 A McDonald and Tatum, I guess.

26 MR. STRAND: Approximately 10 miles
27 south of Tatum. So really the area proposed for designation,
28 the northern boundary would be approximately 2-1/2 to 3 miles

1
2 southwest of Tatum.

3 MR. PADILLA: I have nothing else.

4
5 CROSS EXAMINATION

6 BY MR. STAMETS:

7 Q Mr. Viney, the two sets of calculations
8 that you run through to show in situ permeability --

9 A Yes, sir.

10 Q -- are both located on the eastern edge
11 of the area --

12 A Yes, sir.

13 Q -- and fairly close together. Why do
14 you feel that we should expect to see this same permeability
15 apply to this somewhat larger area?

16 A Based on the geological information
17 developed, Mr. Stamets, and the conditions that appear through-
18 out the sections of the logs, the conditions of the deposition
19 appear almost identical.

20 I can't answer that it will occur be-
21 cause I don't know, but based on the interpretation of the
22 sands and the -- in other wells and in the wells that we
23 tested, they appear very identical or very similar.

24 MR. STRAND: Would that same permeability
25 factor be expected to occur?
26
27
28

1
2 A. Based on what we have seen, the condi-
3 tions and the sands appear the same, you would have to make
4 that conclusion based on the evidence at hand.
5

6 MR. STAMETS: Any other questions of
7 the witness? He may be excused.

8 Anything further in this case?

9 MR. STRAND: Nothing further, Mr. Exa-
10 miner.

11 MR. STAMETS: If there is nothing fur-
12 ther, the case will be taken under advisement.
13

C E R T I F I C A T E

I, SALLY W. BOYD, C.S.R., DO HEREBY CERTIFY that
the foregoing Transcript of Hearing before the Oil Conserva-
tion Division was reported by me; that the said transcript
is a full, true, and correct record of the hearing, prepared
by me to the best of my ability.
