2020 Annual Class III Well Report Llano Disposal, LLC BW-37 API – 30-25-26370

Submitted by: Laura Angell, 10/11/22

TABLE OF CONTENTSPage

3.	Summary
4.	Monthly fluid Injection and Brine Production
5.	Annual Monitor Well Analytical Data
5.	Injection Pressure Data
5.	Pipeline Hydrostatic Test Results
6.	Quarterly Chemical Analysis
8.	Mechanical Integrity Test Including the Type of Test, i.e., Duration, Guage Pressure, etc.
8.	Deviations From normal Operations
8.	Corrective Action
9.	Area of Review (AOR) Update Summary
12.	Summary MITs, Surface Subsidence Surveys, Cavern Size & Shape, Cavern Volume and Geometry Measurements with Conclusion(s) and Recommendation(s)
13.	Ratio of the Monthly Volume of Injected Fluids to Volume of Produced Brine
13.	Major Facility Activities or Events with any Conclusions and Recommendations
13.	Surface Subsidence Monitoring Plan Data Results
13.	Solution Cavern Characterization Data Results
14.	APPENDIX A – MITs
17.	APPENDIX B – Annual Solution Cavern Characterization
20.	APPENDIX C – Subsidence Survey Results
34.	APPENDIX D – Sundries
36.	APPENDIX E – Well Diagrams
38.	APPENDIX F – Chemical Analysis
48.	APPENDIX G – Certification

Summary of Class III Well Operations

BW37 (State 4 # 1) was put into service in the last quarter 2018 after a successful re-entry and recompletion. After re-entry was accomplished, a production string was run into the Salado. Fresh water was then circulated to test brine quality. Brine quality from this well has been excellent at 10.00 and + lbs per gallon. The amount of fresh water injected to brine recovered has been within expected ratio. Injection pressure required to raise brine to surface has also been found to be very close to anticipated (calculated) values. All numbers concerning fresh water injected to bbls brine recovered can be found on page 4 of this document. There has not been a great demand for brine water in the Tatum area. However, this well has serviced the northern Lea County very well for the demand that does exist. At this time, this well is the only brine producer located north of Lovington NM. Occasional sales have also gone into Texas.

Changes to well construction: Since the production equipment was initially ran into this well, the well has not required servicing. Therefore, no changes have been made.

Changes to tankage/loading facility: No changes have been made to the physical plant since the well was first put into operation. Loading is on a thick concrete pad as planned. The pad is curbed and has a sump for catching any water that might be incidentally spilled by the handling of hoses, etc.

Because this well has not required servicing, very few C-103 reports have needed to be filed since operation began. Those are viewable in the C-103 Summary Report.

A MIT was run on this well per regulation requirements. The chart, along with a description of the successful test (no leak off) is also found in the C-103 Summary report.

A chronological list of C103 forms that Llano Disposal has filed on subject well can be found in **APPENDIX D** at the end of this report.

Annual Monitor Well Analytical Data Results

Please see page 8 of this report for deviations.

Injection Pressure Data

Injection pressure at the well (tubing) averages 275/PSI. The brine well casing pressure (brine to battery), averages about 22 PSI. The field operator checks the pressures daily and records them on the daily log.

Pipeline Hydrostatic Test Results

Service piping both to and from BW37 is 3" SDR11 high density poly. These 2 lines are tested accordingly to 160 psi. The feeder line (fresh water) runs due north from the freshwater pump and facility. The distance is approximately 125'. Testing is accomplished by closing a steel ball valve on the well head, then allowing the freshwater pump to bring pressure up to 160 psi. The line is then isolated by valving installed at each end of the line. Pressure is held static on the line for 1 hour, during which time the line is visually inspected. The 3" SDR11 HD poly line leading from BW37 to the tankage facility, is tested in the same manner. A valve in the line is closed at the tankage facility. Then the freshwater line at the wellhead is allowed to pressure to 160 psi. A jumper line between the freshwater line and the brine line has been installed at BW37 well head to accomplish this. After brine line pressure has risen to 160 psi, the entire system is shut down, then the brine line is isolated by closing valving in place at each end of the line. Pressure is held for 1 hour, during which time the line is visually inspected. The brine line between BW37 and tankage is approximately 200' long. The freshwater line and the brine line run across land that is under the same ownership as Llano Disposal, LLC. Therefore, observing these lines for inspection during testing, and during normal operations, is frequent and at will. The lines between the storage tanks and the truck loading valves, are all 6" SDR11 high density poly. These lines carry normal head pressure of 0 psi (emptied tanks) to 17 psi (full tankage) but are virtually always under positive pressure. These lines are under continual live camera observation and viewed daily, both by truckers and by Llano field personnel. All tanks are 30' fiberglass and are manifolded together with said 6" SDR11 HD poly line. Valving is installed on the outlet of each tank so that any one, or all the tanks can be closed off if needed. All valving and connections are plastic coated steel, stainless steel, poly, or fiberglass.

Pipeline Visual Inspections for leaks are done at minimum every other day, monitoring lines, joints, tanks, and recording volumes and pressure.

Mechanical Integrity Test

A MIT was performed on 1/4/19: Llano scheduled, then ran a MIT on BW37 using a calibrated chart recorder. Subsequent pressure test was successful to 320 psi. See the chart in **APPENDIX A**.

Deviations from normal Operations

1. Surface Subsidence Monitoring Plan Data Results

There was no data for this period and the pandemic had everything chaotic. Normal operations with vendors, etc. were interrupted.

2. Quarterly Chemical Analysis

Analysis was not done in 2020 and the pandemic had everything chaotic. Normal operations with vendors, etc. were interrupted

3. Surface Subsidence Monitoring Plan Data Results

Other than the initial survey and plan creation, there was no other survey done. The pandemic had everything chaotic. Normal operations with vendors, etc. were interrupted.

Leaks and Spills Corrective Action Reports

There were no leaks, spills, or corrective action during this period.

Area of Review Update Summary

Please see below, the original AOR document that was submitted as part of the original application for BW-37. A current, location-by-location review of this brine permit has been completed, and it was found that there has been no oil or gas well development in the area since the original AOR document was created and submitted to NMOCD as part of the original brine permit.

Summary MITs, Surface Subsidence Surveys, Cavern Size & Shape, Cavern Volume and Geometry Measurements with Conclusion(s) and Recommendation(s)

A MIT was performed on 1/4/19: Llano scheduled, then ran a MIT on BW37 using a calibrated chart recorder. Subsequent pressure test was successful to 320 psi. See the chart in **APPENDIX A**.

Please find the Subsidence Plan and Report in **APPENDIX C** at the end of this report, that was prepared for us by Pettigrew and Associates out of their Hobbs, NM office. The importance and purpose of the report is to closely monitor any geological shifting, either vertically or horizontally, in the earth surrounding the brine well. All parameters of Pettigrew's investigation are included in the report, along with a review of the monitoring points as installed and archived during the initial development of the well. The full report/plan is included in **APPENDIX C**.

A description of the Cavern Size & Shape, Cavern Volume and Geometry Measurements, are in **APPENDIX B** at the end of this report.

In conclusion, the operational history of BW37 could be described as "good", meaning that the well has performed very well in producing 10# brine. There are no recommendations at this time.

Injected Fluids to Brine Ratio

Total Brine for the year	16,725
Total Fresh for the year	18,418
Ratio of Fresh to Brine	1.10

Summary of Major Facility Activities

There were no major activities during this period.

Surface Subsidence Monitoring Plan Data Results

The initial plan and survey were done and are included in **Appendix C** at the end of this report.

Solution Cavern Characterization Data Results

Please see **APPENDIX B** at the end of this report for a full description.

APPENDIX B

Cavern Characterization

Cavern Characterization

By the end of 2020, 93,596 bbls of fresh water have been injected into salt strata for the purpose of brine generation (3,931,032 gallons). Well production history has shown that the well reliably produces 10.0 + pound quality brine water. It therefore follows that each gallon of fresh water (testing 8.34 pounds per gallon) has dissolved 1.66 pounds of halite. By simple calculation, 6,525,513 pounds of halite have gone into solution this year. Halite has a SG of 2.17 (compared to fresh water), so is calculated and known to weigh 137.47 pounds per cubic foot. It follows then, that 47,468 cubic feet of halite has gone into solution this year. The amount of fresh water injected (93,596 bbls) as compared to the amount of brine produced (85,023 bbls) shows that water is being used to fill the cavity as the cavity increases in volume:

$85,023 \text{ bbls} / 93,596 \text{ bbls} = 90.8\%$ of water is being recovered as brine, 9.2% is being used to fill the brine cavity.

Since it is impossible to know the exact dimensions of the cavity, some assumptions are reasonably made. OCD regulations require that fresh water be injected down a tubing string so that brine may be produced up the tubing/casing annulus. Therefore, brine generation begins at total tubing depth, and by the time water so circulated reaches that annulus, it has become saturated brine (or "10# brine"). It is logical then, that dissolution will be rapid at first, then tapers off as saturation is achieved. Such action would imply a cone shaped (inverted cone) cavity.

The formula to calculate the volume of a truncated cone is :

$$\text{Volume} = (1/3) \times \pi (R^2 + (R \times r) + r^2) H$$

Where :

- 1) r equals the radius of the small end cone diameter in feet
- 2) R equals the radius of the large end cone diameter in feet
- 3) R^2 is "R squared". r^2 is "r squared".
- 4) H is depth in feet from tubing depth to top of salt (casing shoe).

Fresh water used at BW37 for the purpose of brine generation is known to weigh 8.4 lbs. per gallon. Therefore 1.6 lbs. of salt must be taken up by each gallon of fresh water so injected to result in 10 ppg brine water, which is the known industry standard. It follows then that each barrel of brine water (one API barrel = 42 gallons) contains 42×1.6 lbs. of salt, or 67.2 lbs. of salt. One cubic foot of salt weighs 137.47 lbs. Continuing, the cubic feet of salt consumed in one year is equal to the total amount of salt that is calculated to have gone into solution divided by 137.47 lbs.

The illustration on the following page, with dimensions shown, satisfies the number of cubic feet of halite in solution since operations began, hence the size of cavern.

Cavern Size, Shape, & Volume Estimate

State 4 # 1 (BW-37)
EOY 2019 Brine Cavity Characterization

Estimated height (H) to Casing Shoe is 2434'

Estimated cavern floor diameter (D) is 9.41'

Estimated * Cavern Collapse Ratio is **.003** where $9.41/2434 = .003$

Inserted formula values: $.3330 \times 3.1415(88.36 + 9.41 + 1) 461$ or 47,448 cu ft of halite solution mined (by rounding to the third decimal).

* Per the OCD, the Cavern Collapse Ratio is D/H

RE: Survey Report
Llano Disposal LLC'S State 4 BSW #1 (BW037) Project
2018.1328

SUBSIDENCE MONUMENT SURVEY

On December 27, 2018 a field survey was conducted to set and observe positions of three new subsidence monuments for the State 4 BSW #1 (BW-37) Llano Wellhead located at: N33°13'21.03893", W103°18'55.69480". The well location and associated subsidence monuments can be accessed from NM 206, just south of Tatum, NM in Lea County.

The Google Earth image and the sketch below illustrate locations of the monuments:

The discussion was to set at least three monuments at varying distances from the well head. The three monuments were set at differing distances in three separate directions.

This survey was conducted using Trimble R10 GNSS Receivers and a Trimble DiNi digital level. The GNSS Receivers were used to establish the locations of the monuments and the well head through Differential GNSS observations. In an effort to tie into an existing published control point, the National Geodetic Survey website was reference to find the nearest published benchmark. Vertical Control point DQ0312 is located approximately 23,322.68 feet or 4.42 miles northwest of the well site. Once the monument was recovered, a GNSS base was setup over the point and static data was observed for nearly two hours. The data was then submitted to an online positioning service to firmly establish the horizontal coordinates: Latitude: N33°17'11.66161", Longitude: W103°19'02.82827". The published elevation of 4025.20 feet was held.

While, the published/accepted elevation for the point was used. The Trimble DiNi was then used to accurately establish the elevation of the monuments and the wellhead in relation to the NGS control point featured above in the Google Maps screenshot. The DiNi reads a barcode off of a special rod in order to determine difference in elevation from a known control point. The accuracy of this level helps to eliminate human reading errors. The data is

stored onboard and may be transferred directly into the computer software at the office for analysis of results, ensuring greater accuracy.

SUBSIDENCE MONITORING PLAN

The NGS Control Point DQ0312, with an elevation of 4025.20 feet above mean sea level (MSL), will be used as the Reference Control Point for determining the elevations of the newly placed Subsidence Monuments. The elevations of these monuments will be observed semi-annually by a level loop run with the DiNi level to ensure accuracy and precision.

Future observations made on all available points and tabulated to compare the elevations to the base elevations were established on December 27, 2018. The results will be graphically represented by trend lines representing measurements made on each monument. The continual change will be monitored by P.A. and presented to you semi-annually.

MONUMENT DESCRIPTIONS

Each of the monuments set and observed are shown below with a description and images of the point.

X95 – DQ0312

NGS Control Point DQ0312 is a brass U.S. Coast & Geodetic Survey Benchmark set in concrete. It is stamped with an X and with the year it was set as shown below, followed by the NGS datasheet:

Llano Disposal LLC'S State 4 BSW #1 (BW037)

The existing wellhead was measured on the top screw of a brass clamp; leaving the wellhead on a horizontal plane.

**Subsidence Monument 1**

A Berntsen three quarter inch Aluminum Top Security Sleeve Monument was set. It consists of a rod driven till refusal into a pre drilled three-foot deep hole with a twelve inch diameter. The sleeved rod is encased in six-inch PVC filled with sand, then topped with a Datum Point and an Aluminum Floating Datum Cap. It is then capped with an Access Cover that must be removed with a flathead screw driver or similar tool. The Monument is pictured below:

**Subsidence Monument 2**

A Berntsen three quarter inch Aluminum Top Security Sleeve Monument was set. It consists of a rod driven till refusal into a pre drilled three-foot deep hole with a twelve inch diameter. The sleeved rod is encased in six-inch PVC filled with sand, then topped with a Datum Point and an Aluminum Floating Datum Cap. It is then capped with an Access Cover that must be removed with a flathead screw driver or similar tool. The Monument is pictured below:

**Subsidence Monument 3**

A Berntsen three quarter inch Aluminum Top Security Sleeve Monument was set. It consists of a rod driven till refusal into a pre drilled three-foot deep hole with a twelve inch diameter. The sleeved rod is encased in six-inch PVC filled with sand, then topped with a Datum Point and an Aluminum Floating Datum Cap. It is then capped with an Access Cover that must be removed with a flathead screw driver or similar tool. The Monument is pictured below

Top Security Sleeve Rod Monuments

Berntsen Sectional Rod Monument with Floating Sleeve

Berntsen's exclusive Top Security™ Sleeve 3-Dimensional Rod Monument System is specifically designed for high-precision geodetic and GPS surveys. Its patented design helps protect against excessive movements in the control monument. The Berntsen extendible rods, when driven to refusal, provide excellent vertical stability. The unique Y-shaped design of the Top Security Sleeve adds the second and third dimension to provide the most stable 3-D survey monument available.

Eliminate most common and unexpected shifts in stability by eliminating most of the direct transfer of shifts in movement from ground level or surface movement. Here's how: Rod markers (driven to refusal) have good vertical stability but can be disturbed by the natural phenomenon known as frost heave. Rod markers, installed with a greased-filled PVC pipe surrounding the upper three or four feet (900 or 1200 mm) (or more) of rod, are known to be effective in combating movement caused by frost heave but offer little protection against possible horizontal movement of surrounding earth (another major cause of differences in readings on rod markers). For the first time, Berntsen's Top Security Sleeve™ with the horizontal stability of the original Berntsen Top Security™ finned rod marker system, this is now available in a commercially available survey monument.

It's even extendible! 3' (914mm) lengths of Top Security Sleeves can also be connected together by Berntsen's exclusive End Cap

Alignment Bushings and a little PVC Cement. When used in combination(s), nearly any even-foot length over six feet long (1.83m) of support for the rod marker is possible. That's innovative and flexible design at work for you.

More good news! The Top Security Sleeves' greatest advantage at installation time is speed. Simply drive standard Berntsen round rods to refusal, slip on the grease-filled finned Top Security Sleeve (recommended sleeve length greater than maximum recorded local frost depth), back-fill around the fins with sand, tamp firmly. The color coded End Cap Alignment Bushings follow Berntsen's long established universal color codes for rod marker systems and tell other surveyor's at a glance what size rod is installed - 9/16" (14 mm) Yellow; 3/4" (19 mm) Blue. We recommend NO-TOX lubricating grease to fill the Top Security Sleeve. It is specially formulated to be non-toxic and environmentally safe. It is available in an easy to use cartridge that fits a standard "grease gun". One cartridge should be used for each 36" (915mm) long Top Security Sleeve.

RE: TATUM BRINE

Enclosed are the results of analyses for samples received by the laboratory on 11/08/17 14:45.

Cardinal Laboratories is accredited through Texas NELAP under certificate number T104704398-17-9. Accreditation applies to drinking water, non-potable water and solid and chemical materials. All accredited analytes are denoted by an asterisk (*). For a complete list of accredited analytes and matrices visit the TCEQ website at www.tceq.texas.gov/field/qa/lab_accred_certif.html.

Cardinal Laboratories is accredited through the State of Colorado Department of Public Health and Environment for:

Method EPA 552.2	Total Haloacetic Acids (HAA-5)
Method EPA 524.2	Total Trihalomethanes (TTHM)
Method EPA 524.4	Regulated VOCs (V1, V2, V3)

Cardinal Laboratories is accredited through the State of New Mexico Environment Department for:

Method SM 9223-B	Total Coliform and E. coli (Colilert MMO-MUG)
Method EPA 524.2	Regulated VOCs and Total Trihalomethanes (TTHM)
Method EPA 552.2	Total Haloacetic Acids (HAA-5)

Accreditation applies to public drinking water matrices for State of Colorado and New Mexico.

This report meets NELAP requirements and is made up of a cover page, analytical results, and a copy of the original chain-of-custody. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Celey D. Keene

Lab Director/Quality Manager

Cardinal Laboratories

* = Accredited Analyte

PLEASE NOTE: Liability and Damages. Cardinal's liability and client's exclusive remedy for any claim arising, whether based in contract or tort, shall be limited to the amount paid by client for analyses. All claims, including those for negligence or any other cause whatsoever shall be deemed waived unless made in writing and received by Cardinal within thirty (30) days after completion of the applicable service. In no event shall Cardinal be liable for incidental or consequential damage including, without limitation, business interruptions, loss of use, or loss of profits incurred by client, its subsidiaries, affiliates or successors arising out of or related to the performance of the services hereunder by Cardinal, regardless of whether such claim is based upon any of the above stated reasons or otherwise. Results relate only to the samples identified above. This report shall not be reproduced except in full with written approval of Cardinal Laboratories.
