RAIL CAR LOADING AREA RELEASE SOIL SAMPLING INVESTIGATION REPORT

DECEMBER 12, 2021

Executive Summary

Western Refining Southwest LLC, D/B/A Marathon Gallup Refinery (Refinery), is submitting this investigation report for sampling of soils at the rail car loading area to evaluate if hydrocarbon impacts exist in the area. The sampling was conducted to determine if additional investigation or soil excavation would be necessary following historical releases. The sampling took place during the weeks of August 9, 2021 and August 16, 2021. Sampling was conducted in accordance with an approved revised work plan submitted to the New Mexico Environment Department (NMED) on April 30, 2021 (MPC 2021) and approved by NMED on June 15, 2021 (NMED 2021).

On May 7, 2017, a hydrocarbon spill was discovered pooling underneath the pipe rack located along the west side of the rail car loading area (see Section 1.1, Figure 2). An estimated 8,900 gallons of recovered gasoline were placed in a slop tank. At that time, no soil confirmation samples were collected. The on-site laboratory analyzed one release sample, which verified that the released product was gasoline. In an effort to remove impacts, approximately 153 tons of impacted soils were excavated from beneath the pipe rack in November 2018 (MPC 2020).

On March 13, 2019, diesel was discovered leaking in the rail car loading area due to a connection failure on the diesel filter pot. Diesel leaked across the railroad tracks into a culvert carrying product into the stormwater ditch (see Section 2.1, Figure 2). An estimated 42 barrels was released; 40 barrels were recovered via vacuum truck and 2 barrels were not recovered.

The August 2021 investigation field work consisted of:

- Collection of surface soil samples within the gasoline release and diesel release areas
- Installation of soil borings to observe visual impacts, collection of photoionization detector (PID) readings, and collection of soil samples from the borings.
- Collection of equipment blanks and blind duplicates at a rate of 10 percent.

The soil surface samples were collected using a hand auger and hand trowels, and soil borings were completed with a Geoprobe direct push rig. All samples were analyzed for total petroleum hydrocarbons (TPH)– diesel range organics (DRO), TPH – gasoline range organics (GRO), TPH – oil range organics (ORO), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), total metals, and mercury. The results were compared with NMED Industrial Soil Screening Levels (SSLs) dated June 2019. There were no VOC or metal exceedances. Toxicity Characteristic Leaching Procedure was deemed not necessary, based on the total metals results. It should be noted that none of the SVOC exceedances were detected results. However, several sample locations had elevated reporting limits for SVOCs and those reporting limits exceeded their respective NMED Industrial SSLs for the constituents noted below:

- SVOCs:
  - Bis(2-chloroethyl)ether
  - 3,3’-Dicholorobenzidine

  - 2,4-Dinitrotoluene
  - 2,6-Dinitrotoluene
  - Hexachlorobenzene
  - Hexachlorobutadiene
  - Nitrobenzene
  - N-Nitrosodimethylamine
  - Pentachlorophenol
  - 1,2,4-Trichlorobenzene
- General chemistry analytes:
  - TPH-DRO
  - TPH-GRO
  - TPH-ORO

Based on the analytical data and field observations collected to date, the impacted area will be excavated. The excavation can be reliably guided by visual and olfactory observations and PID field screenings. Excavation depth will be determined by using a PID during the excavation. Excavation will continue vertically until the PID readings are below 100 parts per million or until refusal, whichever occurs first. Floor and wall confirmation samples will be collected and analyzed for TPH-DRO and TPH-GRO. Wall confirmation samples will be collected every 250 feet along the excavation perimeter and six floor samples will be collected. The sample results will be submitted to NMED in a subsequent report 120 days after the receipt of analytical data.

1.0 Introduction

Western Refining Southwest LLC (D/B/A Marathon Gallup Refinery [Refinery]) is submitting this investigation report for the sampling of soils at the rail car loading area for hydrocarbon impacts due to historical releases. The sampling was conducted to determine if additional investigation or soil excavation is necessary. The sampling took place during the weeks of August 9, 2021 and August 16, 2021. Sampling was conducted in accordance with the approved revised work plan submitted to the New Mexico Environment Department (NMED) on April 30, 2021 (MPC 2021) and approved by NMED on June 15, 2021 (NMED 2021).

1.1 Background

The Refinery is located approximately 17 miles east of Gallup, McKinley County, New Mexico along the north side of Interstate Highway I-40 (Figure 1). The physical address is I-40, Exit #39 Jamestown, New Mexico 87347. The Refinery property covers approximately 810 acres and is currently indefinitely idled.

As detailed in "Response Action Report, DGS 105 Additive Tank – Rail Car Loading Area – Gasoline Release" (MPC 2020), approximately 8,900 gallons of gasoline were released under the rail car loading rack on May 7, 2017. In November 2018, approximately 153 tons of petroleum-impacted soils beneath the pipe rack were excavated to a depth of 18 inches below ground surface (bgs) (MPC 2020). Based on the analytical data from the excavation, the release was not anticipated to extend further into the subsurface. However, soil confirmation samples were not collected, and this assumption was not confirmed. On March 13, 2019, an estimated 1,765 gallons of diesel were released in the same area. Of the 42 barrels (1,765 gallons) released, approximately 40 barrels (1,680 gallons) were recovered via vacuum truck.

1.2 Historic Sampling and Results

Prior sampling around the Rail Car Loading area was conducted during the 2019 Laser-induced Fluorescence (LIF)/Hydraulic Profiling (HP) Investigation. LIF borings EB-LIF-12, EB-LIF-13, EB-LIF-14 are located near the Rail Car Loading area. Boring EB-LIF-12 showed a response indicative of gasoline, EB-LIF-13 showed a response indicative of diesel, and EB-LIF-14 did not have a response indicative of a specific hydrocarbon product. More information on the LIF/HP Investigation can be found in the "Tank 570 and Additional Areas Laser-Induced Fluorescence/Hydraulic Profiling Investigation Report," submitted to NMED on October 28, 2021.

1.3 Sampling Activities Per the Approved Work Plan

A revised Work Plan (MPC 2021) was submitted and approved by the NMED in June 2021 (NMED 2021), and consisted of the following major elements:

- Collect soil samples within the gasoline release excavation area
- Install soil borings to observe impacts, collect photoionization detector (PID) readings for evidence of impacts, and collect soil samples from the borings at the surface and then at 2.5-foot (ft) intervals until 8 ft bgs.

- Analysis of samples using field screening with a PID, and submission of laboratory samples for analysis of total petroleum hydrocarbons (TPH) – diesel range organics (DRO) by Method 8015M/D, TPH - gasoline range organics (GRO) by Method 8015D, TPH – oil range organics (ORO) by Method 8015, volatile organic compounds (VOCs) by Method 8260B/1311, semivolatile organic compounds (SVOCs) by Method 8270/8270SIM, total metals by Method 6020, and mercury by Method 7471.
- Analysis of Toxicity Characteristic Leaching Procedure (TCLP) metals by Method 6010B, if deemed necessary based on total metals results.
- Duplicate samples and equipment blanks for the purpose of quality assurance.
- Analytical results comparison against NMED Residential and Industrial Soil Screening Levels (SSLs) (NMED 2019).

2.0 Field Investigation Results

Trihydro Corporation (Trihydro) conducted field activities and sampling during the weeks of August 9, and August 16, 2021. The samples were collected from 17 locations, including 6 soil borings and 11 surface soil sample locations. Boring sample depths ranged from surface to 8 ft bgs. The samples were generally collected in the locations presented in the Work Plan (MPC 2021) but deviated slightly based on the conditions observed in the rail car loading area during the sampling, as discussed in Section 2.3.

2.1 Summary of Field Sampling Activities

A total of 54 samples plus 7 duplicate samples, 7 equipment blanks, and 3 trip blanks were collected from the release area in August 2021. Both surface soil samples and soil samples from borings were collected. Additionally, PID readings were collected in the field from all soil borings. Sample locations are shown on Figure 2.

Surface soil samples were collected using a hand trowel or hand auger. Surface samples were taken at 11 different locations within the known diesel and gasoline release area. At each location, a sample was collected at 6 inches bgs and 1 ft bgs.

Soil borings were installed at six different locations surrounding the known diesel and gasoline release areas. A Geoprobe was used to complete the borings. Field samples were collected at 1 ft intervals starting at the surface through to the total boring depth. These samples were placed in a Ziploc® bag and allowed to warm to 70 degrees Fahrenheit. The headspace was measured for petroleum hydrocarbons with a PID and recorded on the boring logs. All PID readings collected are shown on Table 1. Similarly, analytical samples from the borings were collected first at the surface, and then at 2.5-ft intervals to the total boring depth of 8 ft bgs. An additional sample was collected if signs of contamination (i.e., the highest PID reading) was recorded outside the proposed sampling interval of every 2.5 ft. Total depth was achieved at five of the soil borings; one boring was completed at 3 ft bgs due to encountering a concrete pad.

All soils obtained for analysis were also visually inspected and classified in the field, in general accordance with American Society for Testing and Materials D2487 (Unified Soil Classification System) and D2488 (Description and Identification of Soils) by a field geologist. All observations were recorded in boring logs (Attachment A). The samples were placed in laboratory provided sample containers, labeled, and placed in a cooler, iced, and delivered to Hall Environmental Laboratories for analysis for TPH-DRO by Method 8015M/D, TPH-GRO by Method 8015D, VOCs by Methods 8260B and 1311, SVOCs by Methods 8270 and 8270SIM, total metals by Method 6020, and mercury by Method 7471.

2.2 Field Observations

This investigation focused on three impacted areas, shown in red and green on Figure 2. The first area is west of the rail car loading area. Impacts from gasoline and diesel releases were presumed to be present in this area. The second area is east of the rail car loading area. Diesel release impacts were presumed to be present in this area, as the diesel spill that occurred in the first area was able to travel east via a stormwater culvert. The third

area is north of the second area, as a stormwater conveyance ditch allowed diesel from the same spill to travel into this third area.

Four soil borings (RCR-SB-3, RCR-SB-4, RCR-SB-5, and RCR-SB-6) were installed around the first area. Soils in these borings were visually impacted from hydrocarbons, as a smear zone was present, and accompanied by a hydrocarbon smell. Six surface soil sample locations (RCR-SS1 through RCR-SS6) were also collected from around or within this first area. A hydrocarbon odor was noted from the soil samples.

Two soil borings (RCR-SB-1 and RCR-SB-2) and three surface soil sample locations (RCR-SS7, RCR-SS8, and RCR-SS9) were installed in the second area. A hydrocarbon smell was noted throughout RCR-SB-1, with hydrocarbon staining towards the bottom of the boring. Pockets of tar were observed in soil boring RCR-SB-2.

Two surface soil samples (RCR-SS10 and RCR-SS11) were collected from the third area. No soil borings were installed in this area, as summarized in Section 2.3. Both surface soil samples were noted to be all reddish-brown clay with no hydrocarbon odor and no hydrocarbon staining.

Completed soil boring logs can be referenced in Attachment A.

2.3 Deviations from Approved Plan

Deviations from the sampling plan approved by NMED (NMED 2021) included the following:

- Completion of RCR-SB-6:
    - Per the approved Work Plan, soil borings were to be completed to a depth of 8 ft bgs. RCR-SB-6 was only completed to a depth of 3 ft bgs, due to a concrete pad encountered at 3 ft bgs. Samples from RCR-SB-6 were collected in accordance with the Work Plan.
- Completion of a soil boring in the third area:
    - Per the approved Work Plan, a soil boring was to be completed to a depth of 8 ft bgs in the northern stormwater culvert. However, field work was conducted during a period of heavy rains, and stormwater runoff from the eastern side of the Refinery collected in this stormwater culvert. As such, the approved proposed soil boring location was under approximately 3 to 4 ft of water. Several attempts were made to drain this stormwater culvert, but afternoon rains refilled the culvert. Additionally, the mud in this area made it impossible to position the drill rig safely. Due to these circumstances, this soil boring was not collected. The Refinery will install this soil boring and collect samples in accordance with the approved Work Plan during the next drilling event, if feasible. An addendum to this Report, summarizing field observations and analytical results of this soil boring, will be provided to NMED 90 days after receipt of analytical data.

- Analysis of mercury by Method 7470:
    - Per the approved Work Plan, samples were to be analyzed for mercury by Method 7470. However, Method 7470 is the method for groundwater analysis. Method 7471 is the method for soil analysis. Because all samples collected during this investigation were soil samples, the samples were analyzed for mercury by Method 7471.

3.0 Laboratory Analytical Results

Results of the various parameters with applicable standards are presented in the following tables:

- Table 2 – VOCs
- Table 3A – SVOCs
- Table 3B – SVOCs by Selected Ion Monitoring analysis
- Table 4 – Metals
- Table 5 – General Chemistry

Analytical laboratory reports are included in Attachment B. Results for TPH-DRO and TPH-GRO are shown on Figure 3.

3.1 VOCs

The sample results of VOCs compared to their respective NMED Residential and Industrial SSLs are provided in Table 2. No Industrial SSL exceedances were identified for VOCs.

3.2 SVOCs

The sample results of SVOCs compared to their respective NMED Residential and Industrial SSLs are provided in Tables 3A and 3B. Reporting limits exceedances of industrial SSLs were identified for 10 SVOCs, but all exceedances are for non-detect results. The 10 SVOCs are:

- Bis(2-chloroethyl)ether
- 3,3'-Dichlorobenzidine
- 2,4-Dinitrotoluene
- 2,6-Dinitrotoluene
- Hexachlorobenzene
- Hexachlorobutadiene
- Nitrobenzene
- N-Nitrosodimethylamine
- Pentachlorophenol
- 1,2,4-Trichlorobenzene

It should be noted that several of the samples where reporting limits exceeded industrial SSLs required dilution for analysis due to elevated target and/or non-target analytes, as indicated by TPH-DRO, TPH-GRO, and/or TPH-ORO results. For example, RCR-SB-6 (3 ft) has a dilution factor of 50 and RCR-SB-2 (2ft) has a dilution factor of 100 for SVOC analysis. This dilution caused the SVOC reporting limits on some samples to be elevated. Therefore, this dilution may be a contributing factor in the number of non-detect, reporting limit exceedances identified for SVOCs.

3.3 Metals

The sample results of metals compared to their respective NMED Residential and Industrial SSLs are provided in Table 4. No Industrial SSL exceedances were identified for metals. Because no exceedances were identified for metals, TCLP analysis was deemed not necessary and was therefore not conducted.

3.4 General Chemistry

The sample results for general chemistry analytes compared to their respective NMED Residential and Industrial SSLs are provided in Table 5. Industrial SSL exceedances were identified for TPH-DRO, TPH-GRO, and TPH-ORO.

3.5 QA/QC Samples

Three methanol blank samples were provided by the laboratory as trip blanks. These samples were sent in the coolers by the laboratory and were not altered between sampling and analysis. There were no analytes detected in the trip blank samples.

Tier II data validation was performed on the data package provided by the laboratory. The Tier II data validation included a review of the completeness of the data packages, chain of custody forms, sample condition receipts, sample preservations, holding times, the case narrative, and the quality control summary. Several data points were assigned data qualifiers during Tier II data validation indicating one or more results are an estimated concentration ("J"), an estimated concentration but may be biased low ("J-"), an estimated concentration but may be biased high ("J+"), an estimated reporting limit ("UJ"), or evaluated to be undetected at the reporting limit ("U"). No data points were rejected and the data completeness for this data set is 100 percent acceptable. A Tier II data validation report is presented in Attachment C.

3.6 Correlation of Analytical Results with PID Field Screening

PID results were compared to the TPH results collected from the same sample. PID results are included in Table 1 and TPH results are included in Table 5. Results indicate a potential positive correlation between elevated PID readings (i.e., greater than or equal to 100 parts per million[ppm]) and Industrial SSL exceedances identified for TPH-DRO, TPH-GRO, and TPH-ORO. There is also potential positive correlation between the PID readings, analytical results, and soil characteristics observed in the field. Therefore, PID readings will be collected during excavation to confirm that hydrocarbon-impacted soil has been excavated from the rail car loading area, along with visual indicators and laboratory confirmation sampling.

3.7 Analytical Results Summary

Of the 54 samples, 46 samples had non-detect SVOC results that exceeded their respective Industrial SSLs, and 8 samples had TPH results that exceeded their respective Industrial SSLs. Results also indicate a positive correlation between elevated PID readings and TPH exceedances. The data presented in Section 3.0 will be used to determine proposed excavation extents. Additionally, PID field screening will be used during excavation to confirm that all impacted soils have been removed.

4.0 Conclusions

This investigation was conducted to characterize soils in the rail car loading area for future excavation. Much of the vertical and horizontal delineation of contamination was achieved. One soil boring will be installed at a later date, and applicable information will be submitted to NMED as an addendum to this report 90 days after the receipt of analytical data. Significant findings of this investigation include:

- No VOC exceedances
- 46 samples with 1 or more SVOC reporting limit exceedance
- No metals exceedances
- 8 samples with 1 or more TPH exceedance

The results provide a firm basis for proceeding with excavation. Following NMED's review of these results and approval of this report, the Refinery plans to proceed with excavation. The general excavation area is shown on Figure 4. Based on the analytical data and field observations, the excavation of the impacted areas can be reliably guided by visual and olfactory observation and PID field screenings. Excavation depth will be determined by using PID during the excavation. Excavation will continue vertically until the PID readings are below 100 ppm or until refusal, whichever occurs first. Floor and wall confirmation samples will be collected and analyzed for TPH-DRO and TPH-GRO. Wall confirmation samples will be collected every 250 feet along the excavation perimeter and six floor samples will be collected. The sample results will be submitted to NMED in a subsequent report 120 days after the receipt of analytical data.

The Refinery will engage an excavation contractor upon receipt of NMED approval of this report. Following excavation, soils will be sampled and managed appropriately.

RE: Railcar Release Investigation OrderNo.: 2108A86

Dear Brian McLoughlin:

Hall Environmental Analysis Laboratory received 6 sample(s) on 8/19/2021 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. In order to properly interpret your results, it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0901

Sincerely,

Andy Freeman

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. In order to properly interpret your results, it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0901

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services Group on the analytical data report packages generated by Hall Environmental Analysis Laboratory of Albuquerque, New Mexico, with additional data from Anatek Labs, Inc. of Moscow, Idaho evaluating samples from the Marathon Oil site, located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values from:

- Field duplicate pairs
- Matrix spike (MS) and matrix spike duplicate (MSD) pairs
- Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) pairs

Laboratory accuracy was established by reviewing the demonstrated percent recoveries (%R) of the following items to verify that data are not biased.

- MS/MSD samples
- LCS/LCSD samples
- Organic system monitoring compounds (surrogates)

Field accuracy was established by collecting and analyzing the following samples to monitor for possible ambient or cross contamination during sampling and transportation.

- Trip blanks
- Equipment blanks

Tier II Data Validation Report Summary

Method compliance was established by reviewing sample integrity, holding times, detection limits, surrogate recoveries, laboratory blanks, initial and continuing calibrations (where applicable), and the LCS/LCSD percent recoveries against method-specific requirements.

Completeness was evaluated by determining the overall ratio of the number of samples and analyses planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody (CoC), laboratory analytical methods, and other laboratory and field documents associated with this analytical data set.

Tier II Data Validation Report Summary

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Item 2 of the Validation Criteria Checklist.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data that are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R (rejected, data not usable), the data may be used for site evaluation; however, consideration should be given to the reasons for qualification when interpreting sample concentrations. Data points that are assigned an R qualifier should not be used for site evaluation purposes.

If applicable, text was identified in **bold font** in the Validation Criteria Checklist to indicate that further action and/or qualification of the data were required. Data may have been qualified with J data flags by the laboratory if the result was greater than or equal to the method detection limit (MDL) but less than the reporting limit (RL). These laboratory-applied J flags were preserved, if present, and included in the Data Qualification Summary table at the end of this report. If applicable, data validation qualifiers were added for the items noted with crossed circles in the Validation Criteria section above. Please see the Data Qualification Summary table at the end of this report for a complete list of samples and analytes qualified.

If data would be qualified with more than one flag, one qualifier was assigned based on the severity; however, all reasons for qualification were retained. Data that would be qualified with both J+ and J- flags were evaluated based on validation criteria and assigned the appropriate flag. The hierarchy of qualifiers from the most to least severe is as follows:

- R > JB/U > NJ > J+/J- > J/UJ

Data qualifiers used during this validation are included in the following table.

Qualifier	Definition
J	Estimated concentration
J+	The result is an estimated concentration, but may be biased high
J-	The result is an estimated concentration, but may be biased low
UJ	Estimated reporting limit
U	Evaluated to be undetected at the reporting limit

Data Completeness

The analyses were performed as requested on the CoC records. The associated samples were received by the laboratory and analyzed properly unless otherwise noted in the Criteria Checklist below. The complete combined data package consisted of 10,065 data points. The data completeness calculation does not include any submitted blank sample results. Data points were not rejected. The data completeness measure for this data package is calculated to be 100% and is acceptable.

VALIDATION CRITERIA CHECKLIST

1. Was the report free of non-conformances identified by the laboratory? Yes

Comments: The laboratory did not report non-conformances related to the analytical data for this sample set.

2. Were the data free of data qualification flags and/or notes used by the laboratory? No
If no, define.

Comments: The laboratory used the following data qualification flags with this data set.

D – Sample diluted due to matrix.

J – Analyte detected below quantitation limits.

R – %RPD outside laboratory limits

S – % Recovery outside of range due to dilution or matrix.

3. Were sample CoC forms and custody procedures complete? Yes

Comments: The CoC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt. Custody seals were not present or required since the samples were delivered to the laboratory by a laboratory courier, and custody was maintained at all times.

4. Were detection limits in accordance with the quality assurance project plan (QAPP), permit, or method, or indicated as acceptable? Yes

Comments: The reporting limits for the data set were reviewed and appeared to be acceptable. The following dilutions were applied to the project samples.

5. Were the reported analytical methods and constituents in compliance with the QAPP, permit, or CoC? No

Comments: The reported analytical methods were in compliance with the CoC, and the laboratory reported the requested constituents in accordance with the CoC, with the following exceptions.

The CoC requested mercury using Method 7470; however, the laboratory report states that the laboratory used Method 7471B for the mercury analyses. In addition, the electronic data deliverables (EDD) provided by the laboratory indicate that Method 7471 was used for the mercury analyses. The substituted analytical method met similar sensitivity, accuracy, and precision goals and was, therefore, an acceptable replacement.

6. Were samples received in good condition within method-specified requirements? No

Comments: Samples were received on ice, in good condition, and with the cooler temperatures both within and outside the recommended temperature range of 4°C ± 2°C at 1.8°C, 5.0°C, 5.2°C, and 5.7°C as noted on the *Sample Log-in Check Lists*. Samples transferred to Anatek were received in good condition with the cooler temperatures both within and outside the recommended range at 0.9°C, 3.0°C, and 4.7°C and as noted on the *Sample Receipt and Preservation Forms*. The cooler temperatures below 2.0°C were judged as acceptable since the laboratory did not report the sample containers as broken or frozen.

7. Were samples extracted/digested and analyzed within method-specified or technical holding times? Yes

Comments: The samples were digested/extracted and analyzed within method-specific holding times.

8. Were reported units appropriate for the sample matrix/matrices and analytical method(s)? Specify if wet or dry units were used for soil. Yes

Comments: The results were reported in concentration units of micrograms per liter (µg/L) and milligrams per kilogram (mg/kg), which were acceptable for the sample matrix and the analyses requested. The results for the soil samples were reported on a dry weight basis for Method 8270D. The remaining results for the soil samples were reported on a wet weight basis.

9. Did the laboratory provide any specific initial and/or continuing calibration results? No

Comments: Initial and continuing calibration data were not included as part of this data set.

10. If initial and/or continuing calibration results were provided, were the results within acceptable limits? N/A

Comments: Initial and continuing calibration data were not included as part of this data set.

Method	Analyte	Batch	MS Recovery	MSD Recovery	MS/MSD QC Limits	MS/MSD RPD	RPD QC Limits
8270C	**2,4-Dinitrotoluene**	**62017**	**21.7%**	**21.2%**	**36.5-81.5%**	**Acceptable**	**20%**

8015D	**GRO**	**62009**	**184%**	**169%**	**64.4-124%**	**Acceptable**	**20%**

The analyte 2,4-dinitrotoluene was not detected in the associated samples. These results were qualified as UJ due to evidence of potential low bias.

Analytes with MS and/or MSD recoveries greater than the laboratory or data validation QC limits were detected in the associated samples, and the results were qualified as J+ to indicate estimated concentrations that may be biased high.

Mercury with a MS/MSD RPD value that was above the QC limit was detected in the associated samples. These results were qualified as J to indicate estimated concentrations due to evidence of poor precision.

15. Was the total number of LCSs analyzed equal to at least 5% of the total number of samples or analyzed as required by the method? Yes

Comments: The total number of LCS samples analyzed was equal to at least 5% of the total number of samples.

VALIDATION CRITERIA CHECKLIST

16. Were LCS/LCSD percent recoveries and LCS/LCSD RPDs within data validation or laboratory QC limits? No

Comments: The LCS and LCSD percent recoveries and LCS/LCSD RPD values were within laboratory QC limits, with the following exceptions.

Method	Analyte	Batch	LCS Recovery	LCS/LCSD QC Limits
6020	**Barium**	**62196**	**140%**	**70-130%**
6020	**Chromium**	**62196**	**140%**	**70-130%**
6020	**Chromium**	**62061**	**221%**	**70-130%**
7471B	**Mercury**	**62297**	**61.7%**	**70-130%**

The target analytes barium and chromium were detected in the associated samples, and these results were qualified as J+ based on the evidence of potential high bias.

Mercury was detected in the associated samples, and these results were qualified as J- due to evidence of potential low bias.

17. Were surrogate recoveries within laboratory QC limits? No

Comments: Surrogate recoveries in the analyses of the submitted samples were within laboratory QC limits, with the following exceptions.

Method	Surrogate	Sample	Surrogate Recovery	QC Limits
8260B	**4-Bromofluorobenzene**	**RCR-SB1 (4')**	**143%**	**70-130%**
8270C	Nitrobenzene-d_5	RCR-SB2 (7.5')	24.6%	24.7-73.2%
8270C	Nitrobenzene-d_5	RCR-SB4 (5')	22.7%	24.7-73.2%
8015M/D	**DNOP**	**RCR-SS5 (1')**	**131%**	**70-130%**

DRO and ORO were detected in sample RCR-SS5 (1'). DRO and ORO in sample RCR-SS5 (1') were qualified as J+ to indicate estimated concentrations that may be biased high.

Since Method 8260B surrogate associations were not available from the laboratory, qualification was assigned to all of the target analytes when one or more surrogates was outside the acceptance range. This condition existed for the sample RCR-SB1 (4'). The target analytes in sample RCR-SB1 (4') with a surrogate recovery that was greater than the upper laboratory QC limit were qualified as J+ if detected to indicate estimated concentrations that may be biased high. Qualification was not required for the non-detected analytes in the Method 8260B analysis of sample RCR-SB1 (4').

Since Method 8270C surrogate associations were not available from the laboratory, qualification was assigned to all of the target analytes in a given fraction (acid or base/neutral) when two or more surrogates from the same fraction (acid or base/neutral) were outside the acceptance range. This condition did not exist for the samples RCR-SB2 (7.5') and RCR-SB4 (5'). Qualification of sample data was not required.

The SVOC results for multiple samples were not qualified based on the surrogate non-conformances in the Method 8270C analyses since the applied dilutions of 10, 20, 50, and 100 times resulted in surrogate concentrations below routinely calibrated levels, and those results were deemed unreliable and possibly inaccurate.

The DRO and MRO results for multiple samples were not qualified based on the surrogate non-conformances in the Method 8015M/D analyses since the applied dilutions of 10, 20, 50, and 100 times resulted in surrogate concentrations below routinely calibrated levels, and those results were deemed unreliable and possibly inaccurate.

Qualification of sample data was not required based on surrogate non-conformances in QC samples as the environmental samples were evaluated based on their specific surrogate recoveries.

21. Were field duplicate RPD values within data validation QC limits (soil 0-50%, water 0-30%, or air 0-25%)?	No

Comment: As indicated in the Field Duplicate Summary Tables at the end of this report, field duplicate RPD values were within data validation QC limits of 0-30% for water samples, with the following exceptions.

Duplicate pair RCR-SB2 (2') / RCR-BD1: **The RPD values for multiple analytes exceeded the data validation limit of 50%, which was evidence of poor precision. These analyte results were qualified as J for samples RCR-SB2 (2') and RCR-BD1.**

The results for associated samples would typically be qualified based on RPD values greater than 100%, but since multiple field duplicates were collected and analyzed, determination of sample associations would be arbitrary. Therefore, the qualification of the indicated analyte results was limited to the identified samples.

An RPD value could not be calculated for benzo(a)pyrene and benzo(g,h,i)perylene for the field duplicate pair RCR-SB2 (2') and RCR-BD1 since the analytes were detected in the duplicate sample and were undetected in the parent sample. As the detections in the duplicate sample were greater than two times the reporting limit, benzo(a)pyrene and benzo(g,h,i)perylene were qualified as J and UJ for the duplicate and parent samples, respectively.

Duplicate pair RCR-SB5 (5') / RCR-BD2: **The RPD values for multiple analytes exceeded the data validation limit of 50%, which was evidence of poor precision. These analyte results were qualified as J for samples RCR-SB5 (5') and RCR-BD2.**

The results for associated samples would typically be qualified based on RPD values greater than 100%, but since multiple field duplicates were collected and analyzed, determination of sample associations would be arbitrary. Therefore, the qualification of the indicated analyte results was limited to the identified samples

An RPD value could not be calculated for total lead for the field duplicate pair RCR-SB5 (5') and RCR-BD2 since the analyte was detected in the parent sample and was undetected in the duplicate sample. As the detection in the parent sample was greater than two times the reporting limit, total lead was qualified as J and UJ for the parent and duplicate samples, respectively.

An RPD value could not be calculated for multiple analytes for the field duplicate pair RCR-SB5 (5') and RCR-BD2 since these analytes were detected in the duplicate sample and were undetected in the parent sample. Duplicate pair RCR-SB6 (3') / RCR-BD3: **The RPD values for multiple analytes exceeded the data validation limit of 50%, which was evidence of poor precision. These analyte results were qualified as J for samples RCR-SB-6 (3') and RCR-BD3.**

The results for associated samples would typically be qualified based on RPD values greater than 100%, but since multiple field duplicates were collected and analyzed, determination of sample associations would be arbitrary. Therefore, the qualification of the indicated analyte results was limited to the identified samples.

DL – Indicates that the analyte was detected in one of the duplicate samples and was undetected in the other sample, and therefore an RPD could not be calculated. Data were not qualified since the detection was within two times the reporting limit. Non-detected results are indicated above with the applicable reporting limit as ND (RL).

Field duplicate RPD control limits are not to exceed 50% for soil as established by USEPA Region 1 - New England Environmental Data Review Supplement for Region 1 Data Review Elements and Superfund Specific Guidance/Procedures, EQADR-Supplement2, September 2020.

DL – Indicates that the analyte was detected in one of the duplicate samples and was undetected in the other sample, and therefore an RPD could not be calculated. Data were not qualified since the detection was within two times the reporting limit. Non-detected results are indicated above with the applicable reporting limit as ND (RL).

+/-RL – Indicates that the detections in both of the samples were within two times the reporting limit. Qualification of data was not required.

The RPD values for multiple analytes exceeded the data validation limit of 50%, which was evidence of poor precision. These analyte results were qualified as J for samples RCR-SS9 (1') and RCR-BD6.

The results for associated samples would typically be qualified based on RPD values greater than 100%, but since multiple field duplicates were collected and analyzed, determination of sample associations would be arbitrary. Therefore, the qualification of the indicated analyte results was limited to the identified samples.

An RPD value could not be calculated for multiple analytes for the field duplicate pair RCR-SS9 (1') and RCR-BD6 since these analytes were detected in the duplicate sample and were undetected in the parent sample. As the detections in the duplicate sample were greater than two times the reporting limit, these analytes were qualified as J and UJ for the duplicate and parent samples, respectively.

Field duplicate RPD control limits are not to exceed 50% for soil as established by USEPA Region 1 - New England Environmental Data Review Supplement for Region 1 Data Review Elements and Superfund Specific Guidance/Procedures, EQADR-Supplement2, September 2020.

+/-RL – Indicates that the detections in both of the samples were within two times the reporting limit. Qualification of data was not required.

The RPD value for total mercury greatly exceeded the data validation limit of 50% at 151.1%. The total mercury results were qualified as J for the parent and duplicate samples, RCR-SS10 (1') and RCR-BD7, as well as the remaining associated samples based on evidence of extremely poor precision (RPD > 100%).

DATA QUALIFICATION SUMMARY

Abbreviation	Reason
EBD	Equipment blank detection
ERPD-FD	High field duplicate RPD.
ERPD-MS	The MS/MSD RPD exceeded the upper acceptable limit indicating poor precision.
HR-LCS	The LCS and/or LCSD percent recovery was greater than the upper acceptable limit indicating a possible high bias.
HR-MS	The MS and/or MSD percent recovery was greater than the upper acceptable limit indicating possible matrix interference.
HR-SUR	The surrogate percent recovery was greater than the upper acceptable limit indicating a possible high bias.
LR-LCS	The LCS and/or LCSD percent recovery was less than the lower acceptable limit indicating a possible low bias.
LR-MS	The MS and/or MSD percent recovery was less than the lower acceptable limit indicating possible matrix interference.
MDLRL	Flagged by the laboratory: The result was greater than the MDL but less than the RL.
