## Release Notification

### Responsible Party

Responsible Party XTO Energy, Inc.	OGRID 5380
Contact Name Kyle Littrell	Contact Telephone 432-221-7331
Contact email kyle_littrell@xtoenergy.com	Incident # (assigned by OCD) NAB1901038306
Contact mailing address 522 W. Mermod, Suite 704, Carlsbad, NM	

### Location of Release Source

Latitude 32.287      Longitude -103.959  
*(NAD 83 in decimal degrees to 5 decimal places)*

Site Name PCA 53	Site Type
Date Release Discovered 11/27/18	API# (if applicable)

Unit Letter	Section	Township	Range	County
K	23	23S	29E	Eddy

Surface Owner:  State  Federal  Tribal  Private (Name: \_\_\_\_\_)

### Nature and Volume of Release

Material(s) Released (Select all that apply and attach calculations or specific justification for the volumes provided below)

<input checked="" type="checkbox"/> Crude Oil	Volume Released (bbls) 2,022	Volume Recovered (bbls) 0
<input checked="" type="checkbox"/> Produced Water	Volume Released (bbls) 6,066	Volume Recovered (bbls) 0
	Is the concentration of dissolved chloride in the produced water >10,000 mg/l?	<input type="checkbox"/> Yes <input type="checkbox"/> No
<input type="checkbox"/> Condensate	Volume Released (bbls)	Volume Recovered (bbls)
<input type="checkbox"/> Natural Gas	Volume Released (Mcf)	Volume Recovered (Mcf)
<input type="checkbox"/> Other (describe)	Volume/Weight Released (provide units)	Volume/Weight Recovered (provide units)

#### Cause of Release

On November 27<sup>th</sup>, the BLM notified XTO that fluids had been discovered on surface through an existing corehole associated with a nearby potash mine. In October, XTO experienced a pressure loss while drilling the Remuda South 25 State 101H and an unknown volume of flowback fluids were released into the subsurface. BLM has associated the loss of flowback fluids into the subsurface to the November 27<sup>th</sup> event. Inspection of the site was performed by an environmental contractor and review of the data is in progress.

Incident ID	NAB19010383
District RP	2RP-5169
Facility ID	fAB1901038066
Application ID	pAB1901037748

Was this a major release as defined by 19.15.29.7(A) NMAC? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No	If YES, for what reason(s) does the responsible party consider this a major release? The release exceeded 25 bbls of produced water and oil.
If YES, was immediate notice given to the OCD? By whom? To whom? When and by what means (phone, email, etc)? Release was reported by a member of the public to the BLM on 11/27/18. BLM notified XTO and XTO provided notice to Mike Bratcher, Maria Pruitt, Jim Griswold at NMOCD and Jim Amos and Shelly Tucker at BLM on 11/29/18. Notification was provided by email by Bryan Foust.	

## Initial Response

*The responsible party must undertake the following actions immediately unless they could create a safety hazard that would result in injury*

- The source of the release has been stopped.
- The impacted area has been secured to protect human health and the environment.
- Released materials have been contained via the use of berms or dikes, absorbent pads, or other containment devices.
- All free liquids and recoverable materials have been removed and managed appropriately.

If all the actions described above have not been undertaken, explain why:

Per 19.15.29.8 B. (4) NMAC the responsible party may commence remediation immediately after discovery of a release. If remediation has begun, please attach a narrative of actions to date. If remedial efforts have been successfully completed or if the release occurred within a lined containment area (see 19.15.29.11(A)(5)(a) NMAC), please attach all information needed for closure evaluation.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to OCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the OCD does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to groundwater, surface water, human health or the environment. In addition, OCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

## Site Assessment/Characterization

*This information must be provided to the appropriate district office no later than 90 days after the release discovery date.*

What is the shallowest depth to groundwater beneath the area affected by the release?	<u>50-100 (ft bgs)</u>
Did this release impact groundwater or surface water?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release within 300 feet of a continuously flowing watercourse or any other significant watercourse?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release within 200 feet of any lakebed, sinkhole, or playa lake (measured from the ordinary high-water mark)?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release within 300 feet of an occupied permanent residence, school, hospital, institution, or church?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release within 500 horizontal feet of a spring or a private domestic fresh water well used by less than five households for domestic or stock watering purposes?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release within 1000 feet of any other fresh water well or spring?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release within incorporated municipal boundaries or within a defined municipal fresh water well field?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release within 300 feet of a wetland?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release overlying a subsurface mine?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release overlying an unstable area such as karst geology?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Are the lateral extents of the release within a 100-year floodplain?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No
Did the release impact areas <b>not</b> on an exploration, development, production, or storage site?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No

Attach a comprehensive report (electronic submittals in .pdf format are preferred) demonstrating the lateral and vertical extents of soil contamination associated with the release have been determined. Refer to 19.15.29.11 NMAC for specifics.

### **Characterization Report Checklist:** *Each of the following items must be included in the report.*

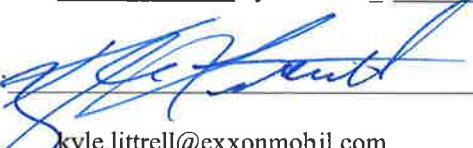

- Scaled site map showing impacted area, surface features, subsurface features, delineation points, and monitoring wells.
- Field data
- Data table of soil contaminant concentration data
- Depth to water determination
- Determination of water sources and significant watercourses within ½-mile of the lateral extents of the release
- Boring or excavation logs
- Photographs including date and GIS information
- Topographic/Aerial maps
- Laboratory data including chain of custody

If the site characterization report does not include completed efforts at remediation of the release, the report must include a proposed remediation plan. That plan must include the estimated volume of material to be remediated, the proposed remediation technique, proposed sampling plan and methods, anticipated timelines for beginning and completing the remediation. The closure criteria for a release are contained in Table 1 of 19.15.29.12 NMAC, however, use of the table is modified by site- and release-specific parameters.

Incident ID	NAB1901038066
District RP	2RP-5169
Facility ID	fAB1901038066
Application ID	pAB1901037748

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to OCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the OCD does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to groundwater, surface water, human health or the environment. In addition, OCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

## Remediation Plan

**Remediation Plan Checklist:** *Each of the following items must be included in the plan.*

- Detailed description of proposed remediation technique
- Scaled sitemap with GPS coordinates showing delineation points
- Estimated volume of material to be remediated
- Closure criteria is to Table 1 specifications subject to 19.15.29.12(C)(4) NMAC
- Proposed schedule for remediation (note if remediation plan timeline is more than 90 days OCD approval is required)

**Deferral Requests Only:** *Each of the following items must be confirmed as part of any request for deferral of remediation.*

- Contamination must be in areas immediately under or around production equipment where remediation could cause a major facility deconstruction.
- Extents of contamination must be fully delineated.
- Contamination does not cause an imminent risk to human health, the environment, or groundwater.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to OCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the OCD does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to groundwater, surface water, human health or the environment. In addition, OCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

## Closure

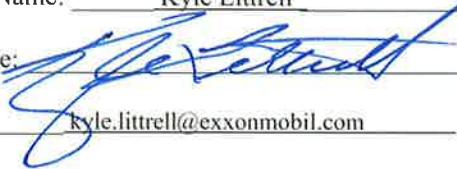

The responsible party must attach information demonstrating they have complied with all applicable closure requirements and any conditions or directives of the OCD. This demonstration should be in the form of a comprehensive report (electronic submittals in .pdf format are preferred) including a scaled site map, sampling diagrams, relevant field notes, photographs of any excavation prior to backfilling, laboratory data including chain of custody documents of final sampling, and a narrative of the remedial activities. Refer to 19.15.29.12 NMAC.

**Closure Report Attachment Checklist:** *Each of the following items must be included in the closure report.*

- A scaled site and sampling diagram as described in 19.15.29.11 NMAC
- Photographs of the remediated site prior to backfill or photos of the liner integrity if applicable (Note: appropriate OCD District office must be notified 2 days prior to liner inspection)
- Laboratory analyses of final sampling (Note: appropriate ODC District office must be notified 2 days prior to final sampling)
- Description of remediation activities

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to OCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the OCD does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to groundwater, surface water, human health or the environment. In addition, OCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations. The responsible party acknowledges they must substantially restore, reclaim, and re-vegetate the impacted surface area to the conditions that existed prior to the release or their final land use in accordance with 19.15.29.13 NMAC including notification to the OCD when reclamation and re-vegetation are complete.

## APPENDICES

APPENDIX A BOREHOLE LITHOLOGIC/SOIL SAMPLING LOGS

APPENDIX B LABORATORY ANALYTICAL REPORTS

# 1 EXECUTIVE SUMMARY

On November 27, 2018, the Bureau of Land Management (BLM) observed fluids in a pasture, which appeared to have emanated from an existing core hole PCA 53 (Site) associated with a neighboring potash mine. The Site is located in Unit K, Section 23, Township 23 South, Range 29 East, in Eddy County, New Mexico. The fluid migrated along the ground surface to the north of the core hole and encompassed an area of approximately 189,230 square feet. The observed surface fluids in the pasture were attributed to a pressure loss associated with drilling operations at the Remuda South 25 State 101H oil well, which is owned by XTO Energy, Inc. (XTO).

Over the past two years, surficial and subsurface soil and groundwater assessments and remedial actions related to the November 2018 release at the Site have been completed. Remedial efforts have included the excavation and proper disposal of over 78,000 cubic yards of petroleum hydrocarbon and chloride impacted soil as well as the recovery of approximately 1,040 barrels (bbls) of impacted groundwater, which included over 67 gallons of phase separated hydrocarbons (PSH) as regulated under 19.15.29 of the New Mexico Administrative Code (NMAC) (Part 29).

XTO submitted previous reports documenting active subsurface remediation and compliance with the closure requirements of Part 29 for excavation and soil sampling. The identification of groundwater during subsurface delineation activities raised questions regarding applicability of 19.15.30 NMAC (Part 30) for abatement of groundwater. The previous reports presented data demonstrating a potential aquifer occurring near 90 feet bgs was not impacted by the release. Shallower disconnected lenses of groundwater with poor quality and hydrocarbon impacts were also identified. This report provides additional information regarding the shallow groundwater, particularly background water quality.

In general, three shallow groundwater zones were identified within the project area and have been designated by the Release Extent Zone (REZ), Southern Groundwater Zone (SGZ), and Northwest Groundwater Zone (NGZ). All three zones are within the Culebra Dolomite Unit and appear of naturally poor quality with total dissolved solids (TDS), iron, manganese, chloride, and sulfate exceeding their applicable New Mexico Water Quality Control Commission (NMWQCC) standards. In general, the two geological features that appear to control shallow subsurface water collection within the project area are troughs within the dolomite unit and collapse features with groundwater collecting within the dolomite unit. The poor quality was observed in all three zones, indicating the interactions between groundwater and dolomite likely has degraded the water quality.

Based on the analytical results and volume of recoverable water removed from the formation, fluid in the REZ is likely a combination of release fluid (produced water and crude oil mixtures) and naturally occurring briny water intermittently fed by the SGZ. Groundwater quality fingerprints for the REZ and SGZ appear to be similar, indicating a similar source of recharge; however, hydrocarbons are absent in the SGZ, further supporting the SGZ as representative of background water quality. The NGZ is separate from the REZ and SGZ, both in apparent lithological formation confinement and water source/recharge process. The groundwater fingerprint of NGZ is substantially different than REZ and SGZ, indicating a different source of recharge, such as precipitation infiltration and vertical migration (based on the presence of e. Coli in groundwater

samples within the NGZ) and final settlement in the dolomite unit. Hydrocarbons were not detected in groundwater within the NGZ, indicating this zone has not been impacted from the release and is not connected to the REZ.

Groundwater assessment results from all activities related to this Site indicate the naturally occurring TDS concentrations within the REZ and SGZ is not less than 10,000 milligrams per liter (mg/L), which is a condition for abatement in Part 30 and for application of water quality standards in 20.6.2.3103 NMAC (Ground and Surface Water Protection). While groundwater within the NGZ is considered protectable, this zone is disconnected from REZ and is not impacted. Identified gypsum and clay units beneath the dolomite unit act as confining units between the REZ and deeper aquifer, preventing any shallow groundwater impacts from vertically migrating to the deeper formation. Because of these factors, the groundwater ingestion exposure pathway at the Site appears to be incomplete at this time. All other exposure pathways have been demonstrated to be incomplete as they relate to this Site as described in previous reports.

As a result of these and previous findings, XTO is respectfully requesting No Further Action (NFA) for Release Permit (RP) Number 2RP-5169 / Incident ID NAB1901038306 under Part 29.

## 2 INTRODUCTION

WSP USA Inc. (WSP), on behalf of XTO Energy, Inc. (XTO), is pleased to present the New Mexico Oil Conservation Division (NMOCD) with this Additional Groundwater Assessment (AGWA) Report and Closure Request for the PCA 53 site (Site). The Site is located in Unit K, Section 23, Township 23 South, Range 29 East, in Eddy County, New Mexico (Figure 1).

This AGWA Report summarizes the release history, including extensive investigation and remediation by XTO, and adds the most recent groundwater assessment results. The latest investigation of groundwater was proposed in the Supplemental Remediation Work Plan (SRWP), dated October 3, 2020, and was conducted as a response to NMOCD's August 3, 2020 comments on the March 20, 2020 Remediation Investigation (RI) Report. This AGWA Report uses the newly acquired data to refine the Site's Conceptual Site Model (CSM) to further explain the release and associated impacts within the conditions of the local hydrogeologic setting.

The report evaluates applicability of New Mexico Administrative Codes (NMACs), specifically work conducted under 19.15.29 NMAC (Part 29) to delineate and remediate the release. Based on the results of remediation conducted by XTO over a two-year timeline since the release occurred and documentation of naturally occurring background conditions specific to groundwater quality, XTO does not believe the Site should be regulated under 19.15.30 NMAC (Part 30) and is requesting closure under Part 29.

### 2.1 RELEASE BACKGROUND

On November 27, 2018, the Bureau of Land Management (BLM) observed fluids in a pasture, which appeared to have emanated from an existing core hole associated with a neighboring potash mine. The fluid migrated along the ground surface to the north of the core hole and encompassed an area of approximately 189,230 square feet (Figure 2). The observed surface fluids in the pasture were attributed to a pressure loss associated with drilling operations at the Remuda South 25 State 101H oil well, which is owned by XTO. XTO submitted a Release Notification Form C-141 (Form C-141) to NMOCD and the Site was assigned Release Permit (RP) Number 2RP-5169 / Incident ID NAB1901038306 with requirements to delineate and remediate the release according to Part 29.

### 2.2 PROJECT CHRONOLOGY

Major milestones for this Site are listed below:

- November 27, 2018 – XTO notified by BLM/NMOCD of Release
- November 28 and 29, 2018 – Initial Assessment of Release
- February through March 2019 - Excavation of top 4 feet of release extent
- May 9 through June 29, 2019 – Initial borehole-delineation activities completed (BH01 through BH21)

- August 28, 2019 – Submittal of Remediation Work Plan to NMOCD
- August 2019 through May 2020 – Excavation to meet Closure Criteria
- October 28, 2019 – Approval of Remediation Work Plan with Conditions (COAs) received from NMOCD
- September 2019 through October 2019 - Advancement of four boreholes (BH22 through BH26) and three deep monitoring wells (MW01 through MW03)
- September 2019 through February 2020 - Advancement of 26 boreholes (BH27 through BH53)
- December 2019 – Shallow Groundwater Aquifer Assessment
- March 20, 2020 – Submittal of RI Report to NMOCD
- May 6, 2020 – Excavation completed (over 78,000 cubic yards)
- August 4, 2020 – NMOCD response to RI Report
- October 2, 2020 – Submittal of SRWP to NMOCD
- December 2020 – Completion of excavation backfill
- January 2021 – Additional groundwater assessment field activities per the SRWP
- February 2, 2021 – Submittal of SRWP Updates Letter to NMOCD

## 2.3 PROTECTABLE GROUNDWATER DESIGNATION

Releases associated with oil and gas development and production in New Mexico are regulated under Part 29 and require the responsible party to contain, report, and remediate releases. Following initial notification, site assessment and delineation typically proceed, followed by remediation according to prescribed closure requirements for soil. Remediation can be completed within 90 days of discovery and submitted in a final closure report to NMOCD for approval or the responsible party must complete remediation according to an approved remediation plan under Part 29 or an abatement plan under Part 30. NMOCD may notify the responsible party if an abatement plan is required under Part 30.

Part 30 regulates groundwater prevention and abatement of groundwater pollution by oil and gas development and production in New Mexico. The objective of Part 30 is stated in 19.15.30.6 NMAC:

*To abate pollution of subsurface water so that ground water of the state that has a background concentration of 10,000 mg/l or less TDS is either remediated or protected for use as a domestic, industrial and agricultural water supply...*

The requirements for abatement of groundwater are listed under 19.15.30.9A and B NMAC, which indicate:

*..the vadose zone shall be abated so that water contaminants in the vadose zone will not with reasonable probability contaminate groundwater or surface water, in excess of standards identified in 20.6.2.7 and 20.6.2.3103 NMAC.*

Section 19.15.30.9B restates that abatement of groundwater pollution to those standards is required:

*..at a place of withdrawal for present or reasonably foreseeable future use where the total dissolved solids (TDS) concentration is 10,000 milligrams per liter (mg/L) or less.*

Only the water quality standards listed in 20.6.2 NMAC apply to this Site, but it provides yet another regulatory reference to a definition of protectable groundwater, acknowledging in 20.6.2.3101 NMAC that the purpose of the water quality standards are:

*..to protect groundwater of the State of New Mexico with concentrations of TDS of 10,000 mg/L or less for present and potential future domestic and agricultural water supplies.*

Based on these references, groundwater containing naturally occurring TDS concentrations in excess of 10,000 mg/L does not meet the applied definition of protectable groundwater. WSP and XTO have utilized these definitions and objective throughout the site assessment, remediation, and exposure pathway evaluation process. As demonstrated in previous reports and confirmed in this report, XTO has demonstrated the following in compliance with Part 29 and Part 30:

- Remediation of the subsurface has been successfully completed under Part 29 through a remediation work plan accepted by the NMOCID;
- Groundwater containing a background concentration of 10,000 mg/L TDS or less has not been impacted; and
- Remediation of the subsurface not only meets the remediation requirements of Part 29, but also included removal of contaminants in the vadose zone such that no contaminants will, within reasonable probability, contaminate groundwater as directed in Part 30.

Subsequent sections in this AGWA Report will utilize these definitions/objectives as a basis for evaluating data, selecting appropriate remediation techniques, and drawing conclusions in closure evaluation.

## 3 CONCEPTUAL SITE MODEL

The Site's CSM was initially described in the August 2019 Remediation Work Plan and expanded upon in the March 2020 RI Report. Below is a summary of the CSM prior to the additional groundwater assessment activities conducted in January 2021, which will be described in later sections.

---

### 3.1.1 SETTING

The Site is located approximately 18 miles southeast of Carlsbad, New Mexico at an elevation ranging from approximately 3,005 feet to 3,030 feet above mean sea level (amsl). The climate in this area is characterized as semi-arid, with an average of 14 inches of precipitation of per year. The Site is located on BLM land and the area immediately surrounding the Site consists of pasture, oil and gas claims, and a potash-mine core hole associated with a nearby potash mine. The Site gently slopes to the north but has little topographic relief aside from several erosional features, caliche outcrops, and undulating hills.

---

### 3.1.2 GEOLOGY

A description of the regional and site-specific geology is presented below. A more detailed description of the regional geology can be reviewed in the March 2020 RI Report. Additional site-specific geological observations and conclusion are included in Section 4.1.2.

### REGIONAL GEOLOGY

The Site is located within the Delaware Basin, a sedimentary region known for extensive potash and petroleum hydrocarbon production in the United States. More locally, the Site is located within the Nash Draw, a topographic depression approximately 4 to 6 miles east-west and 7 miles north-south (Vine, 1963). According to Vine, the draw has no external surface drainage and contains several lakes that have no surface outlet. Most notable in relation to the Site, Salt Lake is located approximately one mile to the west.

Geologic formations most affecting the Site consist of evaporite, carbonate, and clastic sedimentary facies of Permian and younger age. Based on descriptions presented by Vine, shallow rock formations present at the Site are thought to be part of the Rustler Formation of late Permian age. It is interpreted that the dolomite unit present at the Site (described below) is the regionally extensive Culebra Dolomite described by Vine (1963). Vine states the Culebra is light gray, microcrystalline, and contains numerous small cavities ranging from 1 to 10 millimeters in diameter. Vine states there is "little to no tendency for the cavities to be connected" and that the features likely were "formed by the solution of a highly soluble mineral aggregate or by the inclusion of a gas or liquid at the time the sediment was soft". Vine also states that Culebra

Dolomite surface exposures are present in the southern portion of the Nash Draw, east of the Salt Lake (the general location of the Site).

The Culebra Dolomite is underlain by the Los Medaños Member, named by Powers and Holt (1999) and formerly known as the “unnamed lower member”. The Los Medaños Member is the lowest member of the Rustler Formation, which generally consists of siltstone, very fine-grained sandstone, mudstone, and interbeds of gypsum and anhydrite, as seen at the Site underlying the Culebra Dolomite. The Salado Formation underlies the Rustler Formation and is capped by a massive halite bed. The dissolution of this halite member is thought to be the primary geomorphological control for the creation of Nash Draw (Vine, 1963).

Both regional- and local-scale features control the structural deformation of the Culebra Dolomite. As stated above, dissolution of the halite beds in the upper Salado Formation are partly responsible for the regional deformation present in this area. Vine states that “the rocks are locally deformed by solution collapse, which has caused the outcrop pattern to be irregular” and that because of this collapse the “Culebra was not seen in normal stratigraphic sequence with the underlying or overlying rocks in the Nash Draw quadrangle”. Local deformation also is present due to a very ductile mudstone underlying the Culebra dolomite and the dissolution of sulfate cements previously filling cavities and fractures in the dolomite (Holt, Beauheim, & Powers, 2005).

## SITE-SPECIFIC GEOLOGY

In general, the stratigraphic sequence observed at the Site is as follows:

- Clayey/silty sand from ground surface to a maximum depth of approximately 17 feet below ground surface (bgs)
- High plasticity clays up to 30 feet thick
- Poorly- to moderately-consolidated caliche up to 20 feet thick
- Dolomite up to 35 feet thick
- Clay/mudstone up to 15 feet thick
- Gypsum/anhydrites up to 10 feet thick
- Clay/mudstone up to 18 feet thick
- Unconsolidated silty sandstone up to 57 feet thick
- Clay/mudstone that acts as a lower confining layer for the deeper groundwater

The above stratigraphic sequence is generally present across the Site; however, the elevations and thicknesses of units are highly variable. Additional interbedded clay and caliche units were present in several boreholes. Furthermore, several boreholes at the Site encountered caliche and dolomite at or near the ground surface (especially in the far western, northern, and eastern portions of the Site). Although shallow caliche and dolomite were observed, boreholes installed at the Site did not indicate conditions indicative of karst geology, such as sinkholes, voids, caves, and/or springs.

Based on observations recorded during the advancement of boreholes at the Site, the soil/rock stratigraphy variability is likely due to local- and regional-scale deformation (as described above). Initial cross-section interpretations prepared for the Site were presented in the March 2020 RI Report. Figure 3 illustrates cross-section locations. Cross-section Figures 4 through 9 suggest deformation has resulted in complex localized folding or possible faulting of the dolomite and the overlying/underlying units. This deformation likely is caused by post-depositional solution collapse of cavities within the dolomite unit, but more likely large-scale dissolution and subsequent collapse of underlying evaporite beds. Along with the localized fracturing and dissolution within the dolomite, these folds/faults appear to dictate where shallow water is encountered, the hydraulic properties of the dolomite unit, and the hydrological connections of shallow groundwater beneath the Site. Borehole lithologic/soil sampling logs prepared for the Site are included in Appendix A.

### 3.1.3 HYDROGEOLOGY

A description of the regional and site-specific hydrogeology is presented below.

#### REGIONAL HYDROGEOLOGY

According to Holt and others, the post-depositional deformational processes also have caused high variability/heterogeneity of hydraulic properties and groundwater geochemical composition of the Culebra Dolomite. Transmissivity values of the Culebra vary “over six orders of magnitude in a very small area” (Holt, Beauheim, & Powers, 2005). Based on the report prepared by Domski and Beauheim (2011), TDS concentrations in the Culebra Dolomite groundwater located to the north and west of the Waste Isolation Pilot Plan (WIPP) site range from 9,000 mg/L to 239,000 mg/L. The predominant ions present in this groundwater were sodium and chloride, with low potassium and magnesium concentrations. Regionally, the Los Medaños Member acts as a secondary aquifer, though tends to have disconformities due to the dissolution of underlaying salt within the Salado Formation.

#### SITE-SPECIFIC HYDROGEOLOGY

Based on observed conditions, shallow groundwater is present in the lower portion of dolomite unit at the Site, just below 50 feet bgs. The shallow monitoring wells were constructed within the

dolomite unit, interpreted to be part of the Culebra Dolomite. As discussed in the site-specific geology subsection above, it appears the localized post-depositional fracturing/dissolution of the dolomite and lower units as well as the resulting complex folding/faulting dictates 1) where shallow water is encountered, 2) the hydraulic connections between monitoring wells, and 3) the hydraulic properties of the dolomite beneath the Site. It appears the shallow water-bearing zone beneath the Site is locally discontinuous and water present in the dolomite tends to “pool” into troughs created by these post-depositional processes with clay/mudstone and gypsum beneath the dolomite unit acting as a lower confining layer, minimizing vertical migration to a deeper groundwater aquifer. These folds/troughs have created a “bathtub” effect at the Site collecting naturally occurring water within the formation, as well as fluid/water (and the associated contaminants) introduced into the dolomite. This “bathtub” interpretation is also supported by the number of dry boreholes that were advanced at the Site through the dolomite unit to shallower lower confining clay/mudstone and gypsum lithology that did not encounter shallow groundwater. Again, cross-section Figures 4 through 9 illustrate the structural control with depressions, or “bathtubs” containing water separated by structural highs at the base of the dolomite unit.

A deeper semi-consolidated, semi-confined silty sandstone unit containing groundwater has been observed beneath the shallow groundwater located within the dolomite unit. This unit occurs at approximately 85 feet to 90 feet bgs. It is vertically separated from the shallow groundwater by up to 25 feet of a high-plasticity clay that was observed to be dry in all boreholes. Based on the observed conditions during drilling (saturated soil), static groundwater elevations, and laboratory analytical results from groundwater samples, it appears that this silty sandstone unit is a potential aquifer with higher water quality (TDS less than 10,000 mg/L) than the shallow groundwater and is interpreted to be within the Los Medaños Member of the Rustler Formation. In addition to lithologic and vertical separation, water chemistry results, as presented in the Stiff and Piper diagrams (Graphs 1 and 3, respectively), indicate the chemical composition of the deeper water-bearing zone (silty sandstone unit), as represented by monitoring well MW02, is substantially different than the shallow water-bearing zone (dolomite unit), as represented by monitoring wells BH16, BH27, BH39 and BH46. These observations, along with the contaminant analytical data fully presented in the March 2020 RI Report, suggest that there is no communication between the shallow and deep water-bearing zones beneath the release extent of the Site.

### 3.1.4 RELEASE CHARACTERISTICS AND BEHAVIOR

The release characteristics and behavior were thoroughly described in the March 2020 RI Report and are summarized here. It is believed the release fluid originally migrated onto the Site from the core hole located in the southern end of the release extent (see Figure 2). Based on the presence of release fluid and associated impacts, it appears the majority of the release fluid exited the core hole at the ground surface resulting in lateral and vertical distribution of contaminants. The release

footprint at the surface extended approximately 189,230 square feet with subsequent infiltration of fluid from the ground surface penetrating as deep as 20 feet bgs. Soil samples from impacted soil indicated the contaminants of concern were benzene, total petroleum hydrocarbons (TPH), and chloride.

As the fluid traveled up the core hole, a portion of the fluid was introduced directly from the core hole into fractures/pore spaces within the dolomite unit in the subsurface. Based on the initial presence of free product/release fluid in several shallow monitoring wells, as well as the presence of chloride and TPH concentrations in subsurface soil to the east and west of the surface release extent where water was not present, it is believed that the release fluid was initially introduced into the dolomite unit under pressure as opposed to flowing with natural hydraulic gradients. In this case, initial release fluid movement would have been controlled by pressure gradients that allowed the fluid to move through pore spaces, fractures, and/or bedding planes (preferential pathways) within the dolomite. The maximum lateral extent of migration within the dolomite appears to have extended to the vicinity of boreholes BH28 to the east, BH51 to the north, BH48 to the west, and BH16 to the south. Figure 10 illustrates the interpreted fluid movement evolution, which consisted of free product and fluid containing elevated benzene, toluene, ethylbenzene, and total xylenes (BTEX) concentrations. There was no evidence of PSH or elevated BTEX/TPH concentrations in the deeper groundwater or soil samples collected greater than 55 feet bgs, indicating fluids did not escape the core hole at depths below the dolomite unit.

The extent of lateral migration of the release fluid within the dolomite unit may have been limited by one or more of the following factors:

- The loss of release pressure
- Undulations/folds/faults within the dolomite unit
- The high variability of hydraulic properties within the dolomite (hydraulic conductivity and transmissivity limited by connectedness of fractures/pore spaces)

Once the release reached the ground surface, it appears (based on the dry boreholes surrounding the wells) the fluid subsided within the formation to structural low spots or troughs within the dolomite unit.

Based on the analytical results and volume of water recovered from the formation, fluid in the shallow water-bearing zone is likely a combination of release fluid and naturally occurring briny groundwater located south of the release extent. As depicted in Figure 10, there appears to be two separate troughs within the dolomite unit at the Site; one trough located between monitoring wells BH26 and BH51 containing the most significant subsurface impacts and a perpendicular trough between monitoring wells BH39, BH46, and BH53. Based on the locations of the dolomite troughs and the analytical and water chemistry data from the shallow water-bearing zone, it is believed there is a structural separation/barrier in the dolomite between wells impacted by the release fluid (BH14, BH16, BH25, BH26, BH27, BH32, and BH37) within the northwest-southeast trough and non-impacted wells (BH39, BH46, and BH53) within the north-south trough.

The wells south of the impacted area contain elevated chloride and TDS concentrations, but no BTEX (dissolved or liquid phase) signature. Additionally, there are no hydrocarbon soil impacts identified in soils sampled from the southern boreholes. The lack of hydrocarbon signature in the soil and water, which are present in all impacted wells, combined with the structural separation between the two troughs, support the southern water representing background water quality.

As indicated by six quarters of deep groundwater monitoring events demonstrating no evidence of hydrocarbon impact, and a separate water chemistry signature, the impacts summarized above did not affect the underlying aquifer. As the release moved up the core hole, it did not escape into the deeper formation. Additionally, the clay/mudstone and gypsum units present beneath the dolomite unit (water-bearing zone) act as confining units between the shallow and deep water-bearing zones, preventing the shallow groundwater impacts from vertically migrating into the deeper freshwater aquifer. Because of this, the groundwater-ingestion pathway at the Site does not appear to be complete to human and/or ecological receptors.

### 3.2 NMOCD RESPONSE TO RI REPORT

The RI Report describing the CSM summarized above was submitted to NMOCD on March 20, 2020. A response from NMOCD came as an email to Mr. Kyle Littrell, SH&E Supervisor, for XTO on August 4, 2020:

*Good afternoon Kyle,*

*The OCD accepts the data provided in the remedial investigation report and will accept the report in the fee application system. However, the division believes additional investigation must take place to determine the protectability of all shallow groundwaters at this site. At this time, there is not enough evidence to support the claim that the groundwater encountered at this site is not protectable.*

*The division supports XTO's efforts to continue to investigate the exposure pathways of this release and other releases related to the Remuda South 25 101 H fracking event. With what we currently understand of this release, the Division is considering the need to evaluate these incidents under 19.15.30 NMAC.*

*Please let me know if you have any questions.*

*Thanks,*

*Cristina Eads | 505-670-5601*

In response to the email, XTO submitted the SRWP to NMOCD on October 2, 2020 outlining additional remedial actions and data completed after the RI Report submittal and outlining additional groundwater assessment activities.

## REMEDIATION

As reported in the SRWP on October 2, 2020 and a subsequent update letter to NMOCD on February 2, 2021, XTO completed excavation of approximately 78,000 yards of material to as deep as approximately 20 feet bgs. XTO documented soil confirmation sampling to confirm removal of shallow soil impacts. XTO attempted to remove residual soil impacted through mechanical and microbial means. Utilization of a jack hammer to excavate caliche were unsuccessful. Alternatively, XTO utilized Micro-Blaze® in soil with residual petroleum hydrocarbon concentrations exceeding the Closure Criteria was applied at the remaining areas containing elevated petroleum hydrocarbon concentrations. Subsequent samples of excavation floor confirmation samples indicated BTEX and TPH concentrations were compliant with Table 1 Closure Criteria. A total of five floor samples located between approximately 8 feet and 20 feet bgs contained elevated chloride concentrations within dolomite or caliche. Two sidewall samples located directly adjacent to the core hole contained chloride exceeding Table 1 Closure Criteria and one of those samples exceeded Table 1 Closure Criteria for TPH; however, removal of additional soil in that location could compromise the integrity of the core hole.

Following removal of up to 20 feet of impacted soil, which included removal of all hydrocarbon impacts to soil, except for 241 milligrams per kilogram (mg/kg) in one sidewall sample directly adjacent to the core hole, there are no contaminants in the vadose zone that will with reasonable probability contaminate groundwater or surface water in excess of applicable water quality standards. As discussed in the SRWP, vertical migration of the limited residual chloride concentrations to the shallow groundwater through leaching is restricted by the soil the residual concentrations are in (low porosity bedrock), over 20 feet of soil overburden between the residual soil impacts and the shallowest water-bearing zone at the Site, and the fact that the shallow groundwater already has a background chloride concentration that exceeds water quality standards and 10,000 mg/L of TDS.

Free product was removed from the shallow water to the maximum extent practicable (MEP), including over 43,000 gallons of free product and dissolved phase hydrocarbon evacuation utilizing a hydrovac truck, down-hole pumps, and disposable bailers. Groundwater monitoring continued for the deeper freshwater aquifer, with no evidence of vertical migration of hydrocarbons. Leaching to the deeper aquifer is restricted by 35 feet of high-plastic clay and gypsum/anhydrite below the shallow groundwater, preventing any further migration of contaminants to the deeper groundwater aquifer.

Exposure pathways were evaluated and reported to be incomplete to all identified potential receptors. WSP and XTO believe all gross hydrocarbon impacts were removed and minor residual

impacts to shallow groundwater and shallow soil are not a threat to human health and environment. Lastly, the report notified NMOCD that additional assessment activities to confirm the non-protectable status of shallow groundwater had been initiated and would be reported to NMOCD.

The additional groundwater assessment activities occurred in January 2021 and are described in Section 4 below.

# 4 2021 GROUNDWATER ASSESSMENT

## 4.1 DRILLING PROGRAM

Due to the complex and hard rock geology beneath the Site, WSP retained Cascade Drilling, Inc. (Cascade) of Peoria, Arizona to advance 11 shallow boreholes (BH54 through BH64) utilizing a sonic drill rig. Eleven boreholes were installed between January 5 and January 12, 2021 to assess the following locations:

### South

- Boreholes BH54, BH55, and BH56
- Compare the water quality, if present, to that in monitoring well BH53 and confirm presence or absence of BTEX constituents.
- Further investigate natural background water quality (and therefore protectability) and expand on the CSM described in the RI Report (summarized in Section 2.4 of this report).

### West-Northwest

- Boreholes BH58, BH59, BH61, BH62, and BH63
- Assess the presence or absence of shallow groundwater outside of the previously identified shallow groundwater area (delineated by dry boreholes).
- If groundwater was present, evaluate water chemistry and hydraulic connection, if any, to the shallow fluid observed beneath the Site.

### East

- Borehole BH60
- Assess the presence or absence of shallow groundwater outside of the previously identified shallow groundwater area (delineated by dry boreholes).
- If groundwater was present, evaluate water chemistry and hydraulic connection, if any, to the shallow fluid observed beneath the Site.

### Data Gaps

- Boreholes BH57 and BH64
- Installed in and around the release extent to further delineate the shallow groundwater plume and potential lithologic controls.

The 11 installed boreholes are depicted on Figure 11.

---

#### 4.1.1 DRILLING METHODOLOGY

#### FIELD SCREENING AND OBSERVATIONS PROCEDURES

Sonic cores of 6.15 inches in diameter were utilized for the collection of continuous soil samples. During the advancement of each borehole, the subsurface lithology was described in accordance with the Unified Soil Classification System (USCS) as specified in American Society of Testing and Materials (ASTM) D2488.

WSP staff screened soil for volatile aromatic hydrocarbons and chloride utilizing a calibrated photoionization detector (PID) and Hach® chloride QuanTab® test strips, respectively. The PID was calibrated with a 100-parts per million (ppm) by volume isobutylene. Calibration was conducted daily, with bump tests conducted throughout the day. In situations where elevated PID readings are recorded consistently, the PID requires re-calibrated with 100 ppm isobutylene.

Chloride screening with Hach® chloride QuanTab® test strips was conducted by weighing out 25 grams of soil and placing in a jar with a screw top cap. A total of 100 milliliters of distilled water was added to the jar, preparing a 1 to 4 dilution. The mixture was agitated for approximately one minute and allowed to settle. The solution was drawn into a poly-syringe and injected through a 0.45-micron filter to remove any additional sediments in the solution and placed into a decontaminated glass jar for measurement. Based on anticipated concentrations, a low range (30 parts per million (ppm) to 600 ppm) or high range (300 ppm to 6,000 ppm) titrator strip was placed into the jar and allowed to wick the solution per manufacturer directions. Results of the strip readings were multiplied by four to account for the dilution and then multiplied by a 40 percent (%) correction factor. The correction factor has been determined by statistical analysis of historical field screening versus laboratory analytical results for soils in southeast New Mexico.

Observations of petroleum hydrocarbon and/or salt staining and petroleum hydrocarbon odors were recorded for each screened soil sample and documented in field notes and lithologic/soil borehole logs. Lithology and field screening results collected during drilling activities are presented on the lithologic/soil borehole logs attached in Appendix A.

#### SOIL SAMPLING AND ANALYSIS PROCEDURES

Discrete soil samples were collected at a single depth or range of depths within each vertical borehole location depending on field screening and observations. Each sample was placed in two resealable 1-gallon plastic bags; one resealable bag for field screening and the other for potential laboratory analysis, which was immediately placed into an iced cooler.

Soil samples were placed into pre-cleaned glass jars, labeled with the location, date, time, sampler name, method of analysis, and immediately placed on ice. The soil samples were shipped at or below 4 degrees Celsius (°C) under strict chain-of-custody (COC) procedures to Xenco Laboratories (Xenco) in Carlsbad, New Mexico, for analysis of BTEX following United States Environmental Protection Agency (EPA) Method 8021B; TPH-gasoline range organics (GRO), TPH-diesel range organics (DRO), and TPH – oil range organics (ORO) following EPA Method 8015M/D; and chloride following EPA Method 300.0.

#### 4.1.2 SOIL BORING OBSERVATIONS

Based on the observed subsurface lithology, shallow boreholes at the Site generally encountered the following stratigraphic sequence, which was consistent with the previously described stratigraphic sequence:

- Clayey/silty sand from the ground surface
- High plasticity clay
- Poorly- to moderately-consolidated caliche
- Dolomite
- High plasticity clay/mudstone
- Gypsum/Anhydrite

Figure 12 depicts selected new cross section locations to illustrate the subsurface geology beneath the Site. WSP presented six cross-sections in the original RI Report to illustrate results from the subsurface investigations. Cross-section I to I', depicted on Figure 13, extends the original cross-section C to C' to include the new southern wells. Cross-section I to I' illustrates the subsurface geology from the southern portion of the project area to the northernmost groundwater location.

Lithology and presence of shallow groundwater observed in boreholes BH54, BH55, and BH56 were similar to borehole BH53, with the exception of a caliche unit between the silty sand and high plasticity clay unit in the shallow section of the borehole. This stratigraphic sequence was observed north of borehole BH51 within borehole BH46, likely attributable to subsurface deformation from the collapse feature previously identified beneath and captured by borehole BH39.

Moving north of the collapse feature at BH39, borehole BH57 was installed between boreholes BH25 and BH37 to further support lithologic and structural interpretations within the release extent. The clay unit beneath the dolomite unit was observed at a depth shallower than measured groundwater in that vicinity. Groundwater was not observed in borehole BH57, confirming this location which was previously hinted observations from BH16, separates groundwater observed to the north in monitoring wells BH37 and BH51 (release trough in dolomite) from groundwater observed to the south, starting with monitoring well BH25 (southern dolomite trough). The structural high in the dolomite at this location separates the impacts identified in the release trough from the unimpacted water identified in the southern trough.

Borehole BH64 was installed west of the southern trough between boreholes BH38 and BH47 to confirm the presence or absence of groundwater through this data gap location. Lithology within borehole BH64 was similar to the two boreholes it was placed between with the confining clay/mudstone unit beneath the dolomite encountered shallower than observed groundwater in boreholes to the east, confirming this location was not part of the shallow groundwater zone and acts as a barrier for groundwater to move westward.

Cross-sections II to II' (Figure 14), III to III' (Figure 15), and IV to IV' (Figure 16) depict the subsurface lithology within the northwest and intersecting into the rest of the project area.

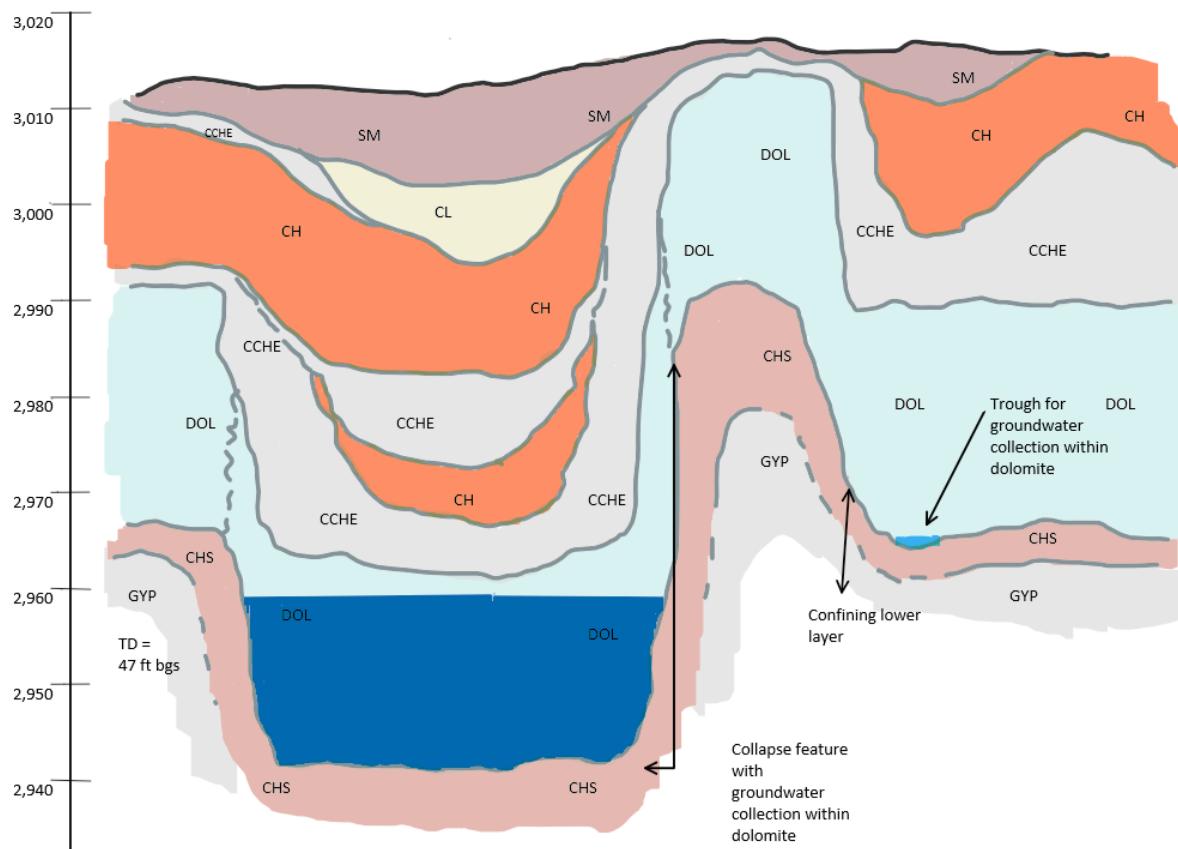

Lithology encountered in boreholes BH49 and BH58, located west-northwest of the release extent, was consistent with the stratigraphic sequence observed in the project area, but the lower confining clay/mudstone and gypsum units were observed above the general groundwater accumulation depth of approximately 55 feet bgs. As a result, groundwater was not observed in these two boreholes, as predicted (cross-section III to III'), and further delineate the impacted trough as dry holes.

To the north of these dry boreholes, the first encounter of dolomite within borehole BH59 was offset by over 20 feet downward when compared to surrounding boreholes, indicating the borehole was installed within a potential collapse feature west of the release extent. This feature is evident in cross-sections II to II' and IV to IV' and strikingly deeper than other "bathtubs" formed at the base of the dolomite unit. Groundwater was present within borehole BH59 and subsequently to the north in boreholes BH61 and BH63, though groundwater was shallower in borehole BH63, indicating groundwater is potentially semi-disconnected by either the lack of preferential pathways within the dolomite unit or a break within the dolomite unit by the confining clay/claystone unit at a shallower depth.

Borehole BH60 was installed east of the project area to determine the presence or absence of groundwater in that location. As observed in other boreholes east of the release extent, dolomite was encountered near the ground surface and the underlaying confining clay/claystone unit was encountered at approximately 18 feet bgs, well above the average groundwater depth in the project area. As such, it appears groundwater is limited immediately east of the Site.

In general, the additional lithologic data confirmed that the two geological features that likely control shallow subsurface water collection within the project area are troughs within the dolomite unit and collapse features with groundwater collecting within the dolomite unit as depicted below.

## Geological Features for Groundwater Collection

**Notes:**

Depth measured in feet above mean sea level (amsl)

CCHE – caliche

CH – high plasticity clay

CHS – high plasticity claystone

CL – clay

DOL – dolomite

GYP - gypsum

SM – silty sand

### 4.1.3 CLOSURE CRITERIA

Based on the Site receptors described in previous reports, the following lists NMOCD *Table 1 Soil Closure Criteria* for the Site's contaminants of concern within soil according to Part 29:

- Benzene: 10 milligrams per kilogram (mg/kg)
- BTEX: 50 mg/kg
- TPH-GRO + TPH-DRO: 1,000 mg/kg
- TPH: 2,500 mg/kg
- Chloride: 10,000 mg/kg

- Chloride (ground surface to 4 feet bgs in areas to be reclaimed immediately): 600 mg/kg

Because depth to water is between 51 feet and 100 feet bgs and the release exceeded 200 barrels (bbls) of unrecovered fluids, delineation of chloride in soil to 600 mg/kg is also required.

---

#### 4.1.4 SOIL ANALYTICAL RESULTS

Soil analytical results for boreholes installed for the scope of work outlined above indicated the following:

- Benzene and total BTEX concentrations were below the NMOCD Table 1 Closure Criteria in all soil samples submitted for laboratory analysis;
- TPH-GRO/TPH-DRO and TPH exceeded their respective NMOCD Table 1 Closure Criteria in soil sample BH57 at approximately 50 feet bgs; and
- Chloride concentrations were below the NMOCD Table 1 Closure Criteria in all soil samples submitted for laboratory analysis.

Table 1 summarizes field screening and laboratory analytical results for soil. Soil analytical results are depicted on Figure 17 and the complete laboratory reports for borehole soil samples is included in Appendix B.

---

## 4.2 GROUNDWATER MONITORING

---

### 4.2.1 MONITORING WELL CONSTRUCTION

Once drilling was complete, each shallow borehole at the Site was left open for at least 72 hours to allow fluid, if present, to collect into the opening. Shallow monitoring wells (denoted with “BH”) were installed to intersect groundwater within the dolomite unit present at the Site. Groundwater collected in 6 of the 11 newly installed boreholes after 72 hours and as a result, permanent monitoring wells were constructed within boreholes BH54, BH55, BH56, BH59, BH61, and BH63.

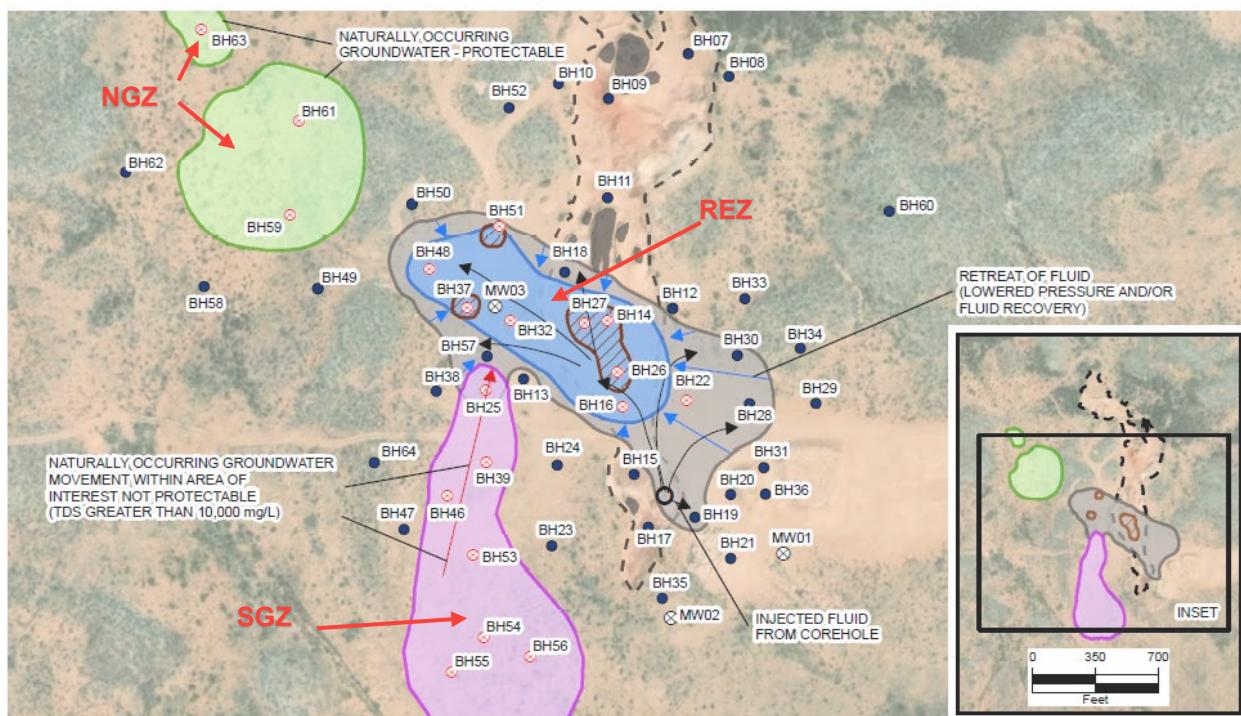

Monitoring wells were constructed following standard industry practice as detailed in both the ASTM Standard D 5092 – Standard Practice for Design and Installation of Groundwater Monitoring Wells in Aquifers (2016) and the New Mexico Environment Department (NMED) Groundwater Quality Bureau (GWQB) Monitoring Well Construction and Abandonment Guidelines (2011). All monitoring wells were constructed with 2-inch inside diameter (ID) Schedule 40 polyvinyl chloride (PVC) casing and screen. The screen was factory-slotted with a slot size of 0.010 inches. Shallow monitoring wells were constructed with 15 to 20 feet of screen and placed across the dolomite water-bearing unit with the bottom screen set just above the clay/mudstone and/or gypsum confining lower geologic layer. A 10-20 size silica sand pack was used to fill the annular space from the bottom of the screen to approximately 2 feet above the top of screen. The sand pack was overlain by hydrated bentonite chips and a grout slurry to the ground surface.

Once installed, the monitoring wells were surveyed with a GPS to determine the latitude and longitude. Top-of-casing elevations were surveyed to an accuracy of no less than plus or minus ( $\pm$ ) 0.01 feet so that groundwater elevations could be determined relative to mean sea level. Well-construction information, including wellhead elevation, top-of-casing elevation, well diameter, screen length, and total well depth, is presented in Table 2.

#### 4.2.2 DESIGNATED GROUNDWATER ZONES

As illustrated in the four refined cross sections depicted on Figures 13 through 16, groundwater beneath and around the Site appears to be disconnected in many locations and semi-disconnected in other areas. In general, three groundwater zones have been identified within the project area and have been designated by the following nomenclatures: Release Extent Zone (REZ), Southern Groundwater Zone (SGZ), and Northwest Groundwater Zone (NGZ). The REZ appears to be semi-disconnected with SGZ with borehole BH57 documenting the structural division between the two zones. The illustration below depicts the three zones.

**Designated Groundwater Zones**

#### **4.2.3 WATER SAMPLING AND ANALYSIS PROCEDURES**

After allowing to stabilize for at least 24 hours after well completion, monitoring wells were developed by purging a minimum of 10-casing volumes, or until the well was purged dry. A casing volume was determined by measuring the depth to water and total depth utilizing an oil-water interface probe capable of measuring fluid to 0.01 feet and then multiplying the water column thickness by the monitoring well inner area.

Sampling was conducted only after the monitoring well recharged for a minimum of 24 hours after well development. During each sampling event and prior to purging/sampling, the depth to water PSH, also known as light non-aqueous phase liquids or LNAPL, below top of casing was measured with an oil-water interface probe. Sampling was conducted using standard collection procedures using disposable bailers as to minimize cross contamination. Each monitoring well was purged prior to sample collection by removing three casing volumes of water or purging until the monitoring well ran dry.

During purging activities, WSP recorded water-quality parameters of pH, electrical conductivity (EC), temperature, dissolved oxygen (DO), and oxidation-reduction potential (ORP) of the fluid/water with a YSI 556 handheld multi-parameter probe or an equivalent instrument. Samples were submitted under strict COC protocol to Xenco for analysis of BTEX and chloride as well as TDS following Standard Method (SM) 2540C. In addition, water from several monitoring wells was analyzed for alkalinity (SM 2320B), carbon dioxide (SM 4500), major cations/anions (EPA Method 300.0), and metals (calcium, iron, manganese, potassium, and sodium by EPA Method 6010C), heterotrophic plate count (HPC) (SM9215B) and e. coli and coliform SM 9223-IDEXX Colisure). The sampling analyses for the various monitoring wells are listed below.

Analytical results from the January 2021 groundwater sampling event and comparisons to previous sampling events are described below.

#### 4.2.4 GROUNDWATER ELEVATIONS

The depth to water and depth to PSH measurements collected between November 2019 and January 2021 are presented on Table 3. Depth to water measurements were collected utilizing an oil-water interface probe capable of measuring product and water to 0.01-feet, which were then converted to elevations using the surveyed top-of-casing data for each monitoring well. When PSH was present in the monitoring well, a density correction of 0.8 was used to calculate the water elevations.

As stated in previous reports, groundwater beneath and around the Site generally collects within fractures and voids within the dolomite unit and as a result, uniform potentiometric surfaces are not associated with this type of environment.

In general, the product thickness in all monitoring wells has decreased throughout product recovery efforts since November 2019. Table 4 includes estimated product recovery volumes.

#### Release Extent Zone

Static groundwater elevations ranged between 2,964.91 feet and 2,968.23 feet above mean sea level (amsl) in the shallow monitoring wells within this zone. Based on groundwater elevations and subsurface lithology interpretations, groundwater in the vicinity of monitoring wells BH37 and BH51 appear to be semi-disconnected from the rest of the REZ as illustrated in Figures 13 and 15. Groundwater appears to generally flow to structural low spots, or troughs within the dolomite unit and confined below by clay/mudstone and gypsum stratigraphic units.

PSH has historically been present in monitoring wells BH14, BH26, BH27, BH37, and BH51. PSH was present in monitoring wells BH14, BH16, BH27, BH37, and BH51 during the January 2021 sampling event. PSH thicknesses ranged between 0.01 feet in monitoring well BH14 to 0.38 feet in monitoring well BH37.

### Southern Groundwater Zone

Static groundwater elevations ranged between 2,964.45 feet and 2,966.97 feet amsl in the shallow monitoring wells within this zone. Groundwater in monitoring well BH46 is lower than the rest of the monitoring wells in this zone, which could be influenced by the interpreted collapse feature in the vicinity of monitoring well BH39 (see Figure 13). Groundwater observed within monitoring well BH39 appears to be semi-confined due to the interpreted collapse and as a result, groundwater appears to have risen to lower pressure (higher elevation) to within the overlain caliche and high plasticity clay. PSH has not been detected within any monitoring wells located in this zone.

### Northwest Groundwater Zone

Static groundwater elevations ranged between 2,964.48 feet and 2,965.10 feet amsl. Based on the interpreted collapse feature that appears to have influenced water collection in this zone, groundwater could be semi-disconnected in the northern portion of the zone in the vicinity of monitoring well BH63 and rest of the zone (see Figure 14). Groundwater in monitoring well BH59 represents the lowest portion of this dissolution feature and the water is separated from the REZ by structural controls, such as the clay/mudstone and gypsum confining layers. PSH has not detected in the three monitoring wells located in this zone.

## **4.2.5 GROUNDWATER ANALYTICAL RESULTS**

Groundwater analytical results were compared to New Mexico Water Quality Control Commission (NMWQCC) standards as a method of evaluation and not necessarily because the standards apply to all groundwater identified. Laboratory analytical results for BTEX, chloride, and TDS are summarized in Table 5 and presented on Figures 18A (REZ), 18B (SGS) and 18C (NGZ). Laboratory analytical results for water chemistry are summarized in Table 6. Complete laboratory reports for the January 2021 water sampling event are attached as Appendix B.

### Release Extent Zone

During the January 2021 sampling event, groundwater analytical results indicated:

- BTEX concentrations have exceeded one or more NMWQCC standards in monitoring wells BH14, BH16, BH25, BH26, BH27, and BH37 during one or more sampling events;
- TDS concentrations in groundwater within this zone ranged from 25,000 mg/L in monitoring well BH48 to 74,000 mg/L in monitoring well BH16; and
- Chloride in groundwater exceeded the NMWQCC standard in all monitoring wells within this zone at concentrations ranging from 26,800 mg/L in monitoring well BH32 to 67,000 mg/L in monitoring well BH16.

### Southern Groundwater Zone

During the January 2021 sampling event, groundwater analytical results indicated:

- No BTEX concentrations in groundwater were detected in any monitoring wells within this zone;
- TDS concentrations in groundwater within this zone ranged from 17,200 mg/L in monitoring well BH53 and 42,800 mg/L in monitoring wells BH55 and BH56; and
- Chloride in groundwater exceeded the NMWQCC standard in all monitoring wells within this zone at concentrations ranging from 4,590 mg/L in monitoring well BH53 to 53,400 mg/L in monitoring well BH54.

### Northwest Groundwater Zone

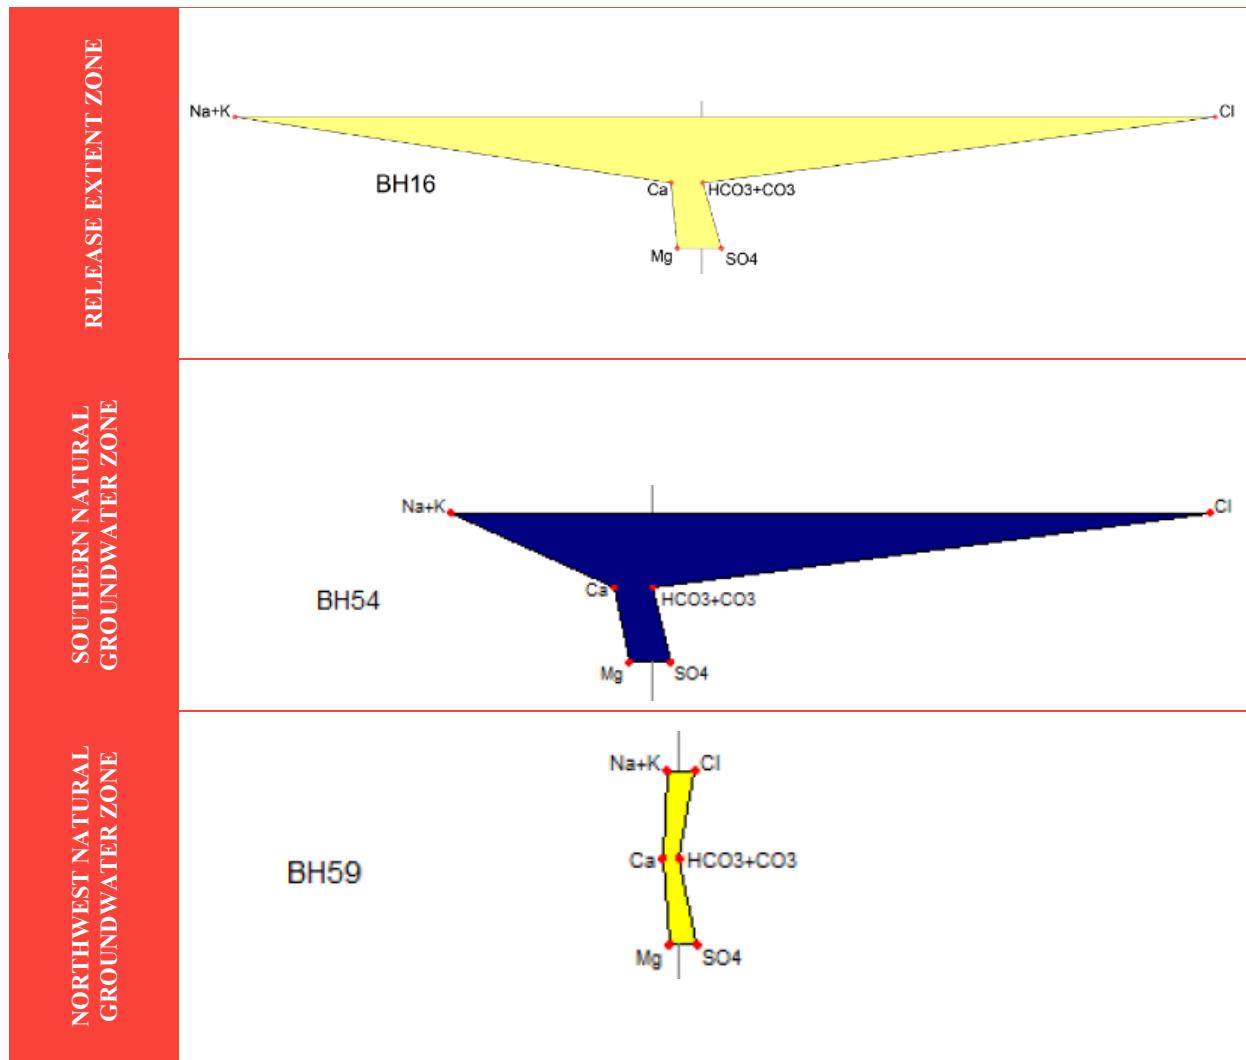

During the January 2021 sampling event, groundwater analytical results indicated:

- No BTEX was detected in groundwater within this zone;
- TDS concentrations in groundwater within this zone ranged from 5,100 mg/L in monitoring well BH59 to 7,090 mg/L in monitoring well BH63, which was greater than the domestic water supply NMWQCC standard, but below the agricultural/irrigation water supply NMWQCC standard; and
- Chloride in groundwater exceeded the NMWQCC standard in all monitoring wells within this zone at concentrations ranging from 1,350 mg/L in monitoring well BH59 to 3,790 mg/L in monitoring well BH61.

## **WATER CHEMISTRY ANALYTICAL RESULTS**

By comparing cation and anions within groundwater, the water chemistry can be “fingerprinted” for similarly connected and feed waterbodies. Stiff and Piper diagrams also have been developed to display the water chemistry data from representative monitoring wells with the three zones and are displayed on Graphs 1 through 4. Overall shallow groundwater throughout the three zones appears to be of poor quality with iron, manganese, chloride, and sulfate exceeding their applicable NMWQCC standards. In general, the groundwater fingerprints within the REZ and SGZ have a higher proportion of sodium and potassium cations and chloride anions with lower calcium and magnesium cations and bicarbonate, carbonate, and sulfate anions, measured in milliequivalent per liter (meq/L). This is consistent with regional hydrogeology characteristics as described in Section 1.4.3. The groundwater fingerprint of the NGZ is low in all cation and anions. The table below illustrates representative groundwater ion chemistry within the three groundwater zones.

## General Groundwater Fingerprints

**Notes:**

Cations are present on the left side of the graph and anions are present on the right side of the graph. Shapes of the graphs are based on milliequivalent per liter (meq/L) concentrations

Na+K – sodium and potassium

Cl – chloride

Ca – calcium

HCO<sub>3</sub>+CO<sub>3</sub> – bicarbonate and carbonate

Mg – magnesium

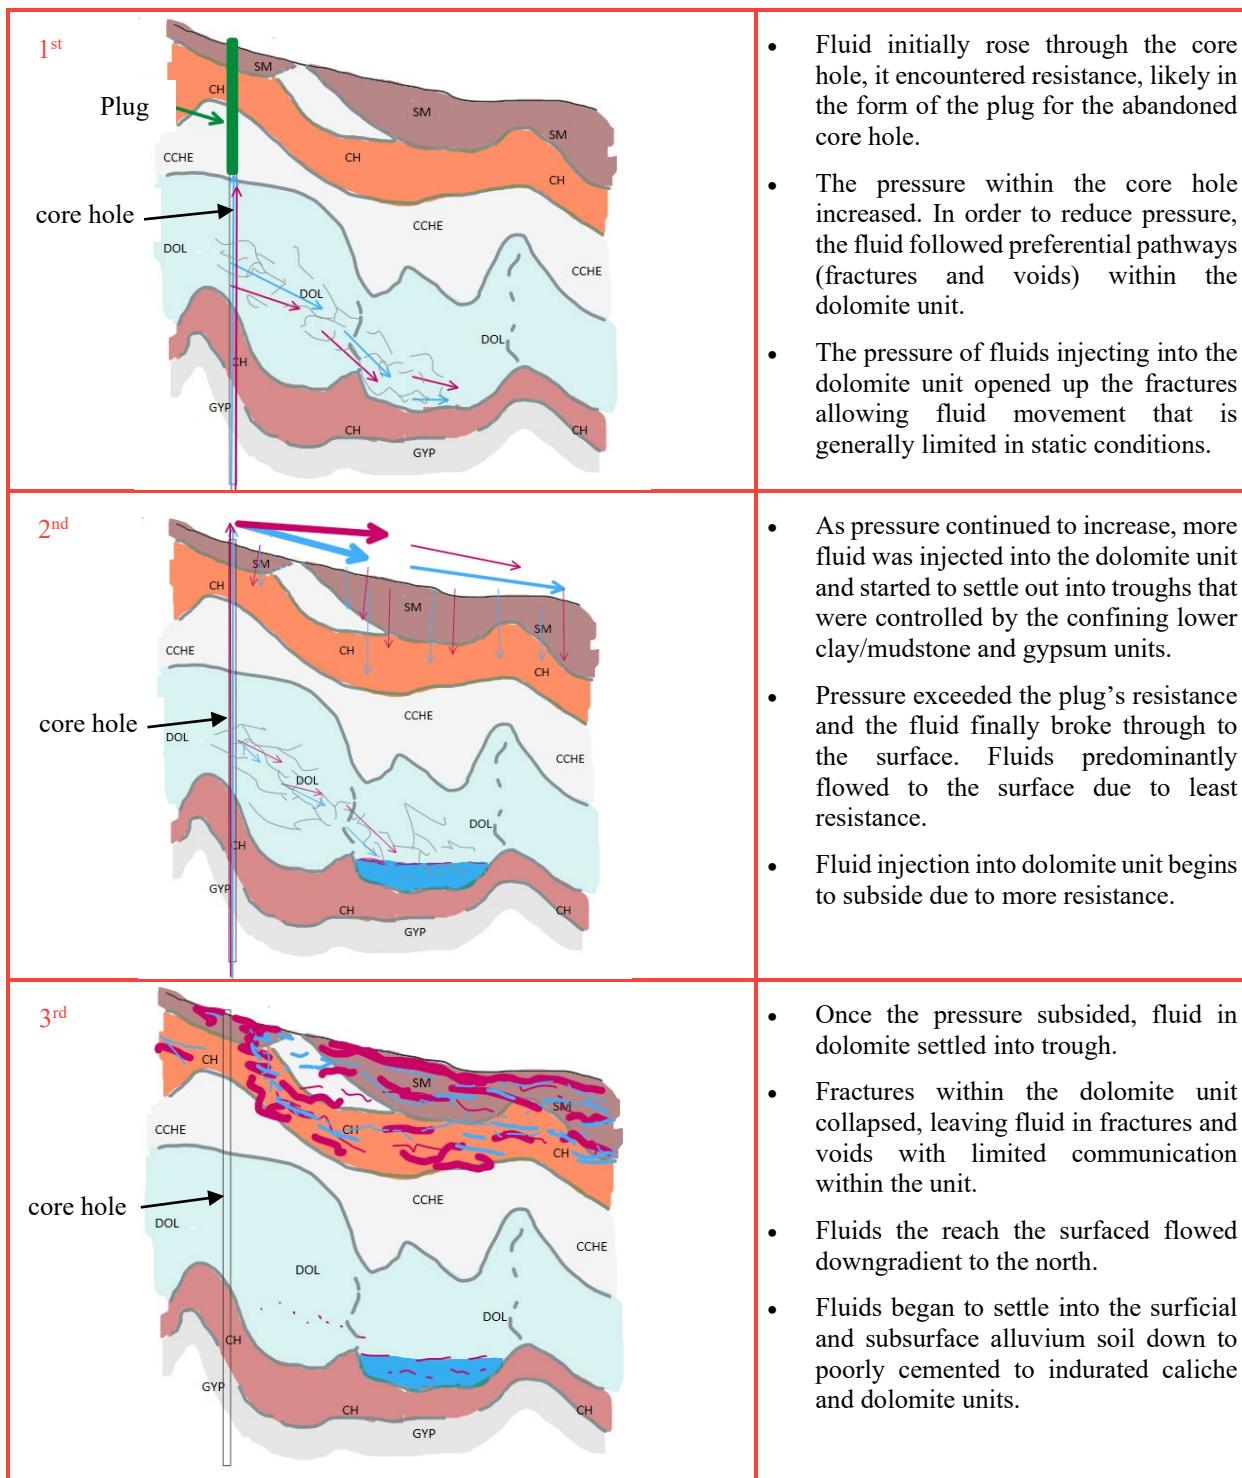

SO<sub>4</sub> - sulfate

Analytical results indicated e. Coli was present in all three monitoring wells within the NGZ, but not in any monitoring wells from the other two zones. Coliform was also detected in groundwater from monitoring well BH59 in the NGZ. No coliform was detected in any other groundwater.

## 5 REFINED CSM

The refined CSM continues to indicate the release fluid originally migrated onto the Site from the core hole located in the southern end of the release extent. As described previously in the RI report and summarized in previous sections of this report, the majority of the release fluids exited the core hole at the surface, impacting shallow soils to approximately 20 feet bgs. Based on the presence of release fluid and associated impacts in the subsurface, it appears some of the release fluid was introduced directly from the core hole into fractures/pore spaces within the dolomite unit in the subsurface. Distribution of the fluid was controlled by pressure from the release and preferential pathways in the lithology. The fluid subsided within the formation to structural low spots or troughs. Below is an illustration of the progression of fluid migration during the release event.

## Fluid Migration

**Notes:**

Blue lines indicate produced water/briny water mixture,  
Magenta lines indicated crude oil mixture

Based on the analytical results and volume of removable water in the formation determined through aquifer testing and fluid recovery (previously reported), fluid in the REZ is likely a combination of release fluid (produced water and crude oil mixtures) and naturally occurring briny water fed by the SGZ, limited to seasonality changes and/or large influx of shallow groundwater from sporadic substantial precipitation events. Groundwater fingerprints for REZ and SGZ appear to be similar, indicating a similar source of recharge, likely from a subsurface source south of SGZ, which contains significantly more fluid than the REZ. No hydrocarbon fingerprint has been observed in soil or groundwater in the SGZ, further supporting the SGZ as representative of background water quality.

The NGZ is completely separate from the REZ and SGZ, both in apparent lithological formation confinement and water source/recharge process. The NGZ was formed by a subsurface collapse beneath the dolomite unit, not simply by a trough at the base of the dolomite. The groundwater fingerprint of NGZ is substantially different than REZ and SGZ, indicating a different source of recharge, such as precipitation infiltration and vertical migration with final settlement in the dolomite unit. BTEX was not detected in groundwater within the NGZ. BTEX is soluble in water and if impacts from the core hole interacted within this zone, one or more BTEX constituents (dissolved or PSH) would have been detected through laboratory analysis, which is not the case. E. Coli and coliform in water are often attributable to the interaction of animal feces with that water. The presence of e. Coli in groundwater within the NGZ indicates the likely source of groundwater recharge in this zone is from surface infiltration and settling within the lower portions of the dolomite unit within the collapse feature vicinity, where REZ and SGZ appear to be recharged from groundwater emanating from the south and moving northward.

Additionally, the gypsum/clay units present beneath the dolomite (water-bearing zone) act as confining units between the shallow and deep water-bearing zones, preventing the shallow groundwater impacts from vertically migrating into the deeper aquifer. As documented in previous reports, all pathways to potential receptors are incomplete. This report confirms that conclusion.

## 5.1 SHALLOW GROUNDWATER PROTECTABILITY STATUS

XTO previously presented in the RI Report that the shallow groundwater identified in the dolomite unit was not protectable because it contains naturally occurring TDS concentrations in excess of 10,000 mg/L. The use of the word “protectable” is derived from the objective of Part 30, which is to abate pollution of groundwater that has a background concentration of 10,000 mg/L or less TDS such that it is remediated to the NMWQCC Standards in 20.6.2.3103 NMAC and toxic pollutant standards in 20.6.2.7 NMAC. The 10,000 mg/L TDS threshold is further used in 20.6.2 NMAC, which states the purpose of the water quality standards are to protect groundwater with concentrations of less than 10,000 mg/L of TDS. Part 30 also indicates the vadose zone must be abated so that water contaminants will not *with reasonable probability* contaminate groundwater or surface water. In response to XTO’s argument, NMOCD indicated additional investigation was required to determine protectability of all shallow groundwaters at the Site for consideration of the need to evaluate the incident under Part 30.

XTO has presented various reports documenting delineation and remediation of subsurface impacts under Part 29. Delineation identified disconnected groundwater present in shallow troughs

of the dolomite unit and a deeper potential aquifer. The shallow groundwater contained impacts from the release, including PSH and dissolved-phase BTEX concentrations. It also appeared to be naturally poor in water quality. The deeper aquifer is more extensive, fresher, and demonstrated no impacts from hydrocarbons over six quarters of monitoring. The water-bearing units appear to be separated by confining units as evidenced by lithologic observations, soil and groundwater sampling results, and water chemistry analysis.

XTO's initial CSM suggested the majority of the release occurred at the surface and migrated vertically through as much as 20 feet of the vadose zone. XTO remediated those impacts by removing approximately 78,000 cubic yards of material and applying a microbial amendment. The minor residual concentrations remaining are restricted in aerial extent, by depth, by concentration, and by lithology. They are unlikely to migrate vertically due to the vertical distance between them and any subsurface water and by the presence of low porosity lithologic units (high-plasticity clays, gypsum, anhydrite). XTO has addressed the impacts to soil under Part 29 and concurrently removed any reasonable probability that water contaminants in vadose zone will contaminant groundwater.

The subsurface investigations previously presented and expanded upon here confirm the presence of groundwater with naturally occurring concentrations of TDS exceeding 10,000 mg/L. Additional boreholes in the SGZ confirm the presence of water in a dolomite trough separated from the impacted trough with no identifiable hydrocarbon impacts to soil or groundwater. The water quality signature between the SGZ and REZ are comparable, indicating the two zones contain the same groundwater, although direct communication is doubtful. Groundwater quality is poor, the result of storage in dolomite and extremely common in the Delaware Basin, especially within Nash Draw. Groundwater in the SGZ and REZ is not protectable and abatement of impacts to NMWQCC water quality standards do not apply.

Although a separate trough was identified in the NGZ, its presence is the result of dissolution and collapse and is sourced from the surface, made clear by the contrasting water quality and presence of bacteria that is lacking in the other shallow groundwater zones. Two contrasting water quality signatures in close proximity is not unheard of in this region, especially in shallow perched groundwater zones with very little volume and controlled by dissolution and fracturing of carbonate facies. While groundwater within the NGZ is considered protectable, BTEX was not detected in groundwater within this zone. BTEX is soluble in water and if impacts from the core hole interacted within this zone, one or more BTEX constituents (dissolved or PSH) would have been detected through laboratory analysis, which is not the case. Therefore, chloride and TDS as well as other groundwater constituents such as iron, manganese, and sulfate appear to be naturally occurring at concentrations that indicate this groundwater is of poor quality and not reflective of impacts from the release.

Similarly, the deeper and fresher groundwater appears to be protectable. It is sourced separately from the shallow water-bearing unit as distinguished between water chemistry analysis and lithologic observations. Following six quarters of monitoring, there is no impact to the deeper water by this release and any reasonable probability of potential future impact by residual hydrocarbons in the vadose zone has been prevented by mass removal of impacted soil. Potential future impacts by residual hydrocarbons in shallow groundwater will be prevented by the vertical distance and lithologic characteristics of the sedimentary facies (gypsum and clay) observed in the

subsurface. These properties prevented impact during the release and 2 years after the release. Removal of impacted fluid to the MEP has been completed and residual impacts do not pose a reasonable threat to leaching. Because of these factors, the groundwater ingestion exposure pathway at the Site appears to be incomplete at this time.

## 6 CONCLUSIONS

Over the past two years, surficial and subsurface soil and groundwater assessments and remedial actions related to the November 2018 release at the PCA 53 Site have been completed. Remedial efforts have included the excavation and proper disposal of over 78,000 cubic yards of petroleum hydrocarbon and chloride impacted soil as well as the recovery of approximately 1,040 bbls of impacted groundwater, which included over 67 gallons of PSH.

The Site is located regionally within the Delaware Basin and locally within the Nash Draw in Eddy County, New Mexico. Surficial geology is made up of the Rustler Formation. The primary shallow aquifer in this region is the Culebra Dolomite Unit. Groundwater in the Culebra Dolomite generally contains naturally occurring TDS concentrations in excess of 10,000 mg/L TDS, which is not required to be abated per Rule 30 nor meet the standards listed in 20.6.2.3103 NMAC.

In general, three groundwater zones have been identified within the project area and have been designated by REZ, SGZ, and NGZ. All three zones are located with the Culebra Dolomite Unit and appear of naturally poor quality with iron, manganese, chloride, and sulfate exceeding their applicable NMWQCC standards. This poor quality has been observed in all three zone, indicating the interactions with the dolomite unit likely has degraded the water quality. In general, the two geological features that likely control shallow subsurface water collection within the project area are troughs within the dolomite unit and collapse features with groundwater collecting within the dolomite unit.

Based on the analytical results and volume of water able to be removed from the formation, fluid in the REZ is likely a combination of release fluid (produced water and crude oil mixtures) and naturally occurring briny water fed by the SGZ. Groundwater fingerprints for REZ and SGZ appear to be similar, indicating a similar source of recharge, likely from an upgradient subsurface source south of SGZ; however, no hydrocarbon fingerprint is apparent in the SGZ, further supporting the SGZ as representative of background water quality.

The NGZ is completely separate from the REZ and SGZ, both in apparent lithological formation confinement and water source/recharge process. The groundwater fingerprint of NGZ is substantially different than REZ and SGZ, indicating a different source of recharge, such as precipitation infiltration and vertical migration and final settlement in the dolomite unit. BTEX was not detected in groundwater within the NGZ, indicating this zone has not been impacted from the release and is not connected to the REZ.

Groundwater assessment results from all activities related to this Site indicate groundwater within the REZ and SGZ are not protectable under 20.6.2 NMAC. While groundwater within the NGZ is considered protectable, this zone is disconnected from REZ and is not impacted. The gypsum/clay units present beneath the dolomite (water-bearing zone) act as confining units between the shallow and deep water-bearing zones, preventing the shallow groundwater impacts from vertically migrating into the deeper freshwater aquifer.

Because of these factors, the groundwater ingestion exposure pathway at the Site appears to be incomplete at this time. All other exposure pathways have been demonstrated to be incomplete as they relate to this Site.

Remediation of the subsurface according to Part 29 was completed and documented in the previous SWGP report and included excavation of 78,000 cubic yards of soil and application of a microbial amendment, followed by confirmation sampling. All soil impacts have been delineated to Table 1 Closure Criteria and to 600 mg/kg chloride both laterally and vertically. Delineation identified impacts to shallow pockets of groundwater collecting in dolomite troughs. XTO removed 43,000 gallons of free product and dissolved phase hydrocarbon which included 47 gallons of free product. The excavation and fluid recovery removed reasonable probability of pollution to groundwater by contaminants in the vadose zone.

## 7 RECOMMENDATION

Based on previous documentation demonstrating compliance with remediation according to Part 29, and supplemental information provided here confirming all exposure pathways incomplete at this time, XTO is respectfully requesting No Further Action (NFA) for RP Number 2RP-5169 / Incident ID NAB1901038306. Once NMOCD approves this request, XTO will plug and abandon the existing monitoring wells per the New Mexico Office of the State Engineer (NM OSE) requirements. XTO will complete seeding of the Site in Spring 2021 and check to verify new growth coverage matches the surrounding area in Fall 2021.

**Notes:**

(a) - closure criteria for soil 0-4 ft bgs

(b) - closure criteria for soil greater than 4 feet bgs

bgs - below ground surface

BTEX - benzene, toluene, ethylbenzene, and total xylenes

CCHE - caliche

CL - clay

DOL - dolomite

DRO - diesel range organics

GRO - gasoline range organics

GYP - gypsum

mg/kg - milligrams per kilogram

ML - silt

NMOCD - New Mexico Oil Conservation Division

NE - not established

ORO - motor oil range organics

PID - Photoionization Detector

ppm - parts per million

SC - clayey sand

SP/SM - poorly graded sand / silty sand

SW - well graded sand

TPH - total petroleum hydrocarbons

**Bold** - indicates result exceeds the applicable Closure Criteria.

&lt; - indicates result is below laboratory reporting limits

-- no data available

**Notes:**

BTOC - below top of casing

GWEL - groundwater elevation

PSH - phase-separated hydrocarbon

TOC - top of casing

- indicates no GWEL or PSH measured

When PSH is detected, the GWEL is corrected using an estimated density correction factor of 0.8

**Notes:**

mg/L - milligrams per liter

NMWQCC - New Mexico Water Quality Control Commission

TDS - total dissolved solids

**Bold** - indicates result exceeds the applicable regulatory standard

&lt; - indicates result is below laboratory reporting limits

(a) - standard for domestic water supply

(b) - standard for agricultural water supply

## Notes:

% - percent

+ - NELAC certification not offered for this compound

--- not analyzed

**BOLD** - indicates concentration exceeds the NMWQCC standard

cfu/ml - colony-forming units per milliliter

D - samples diluted due to targets detected over the highest point of calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

K - sample analyzed outside of recommended hold time

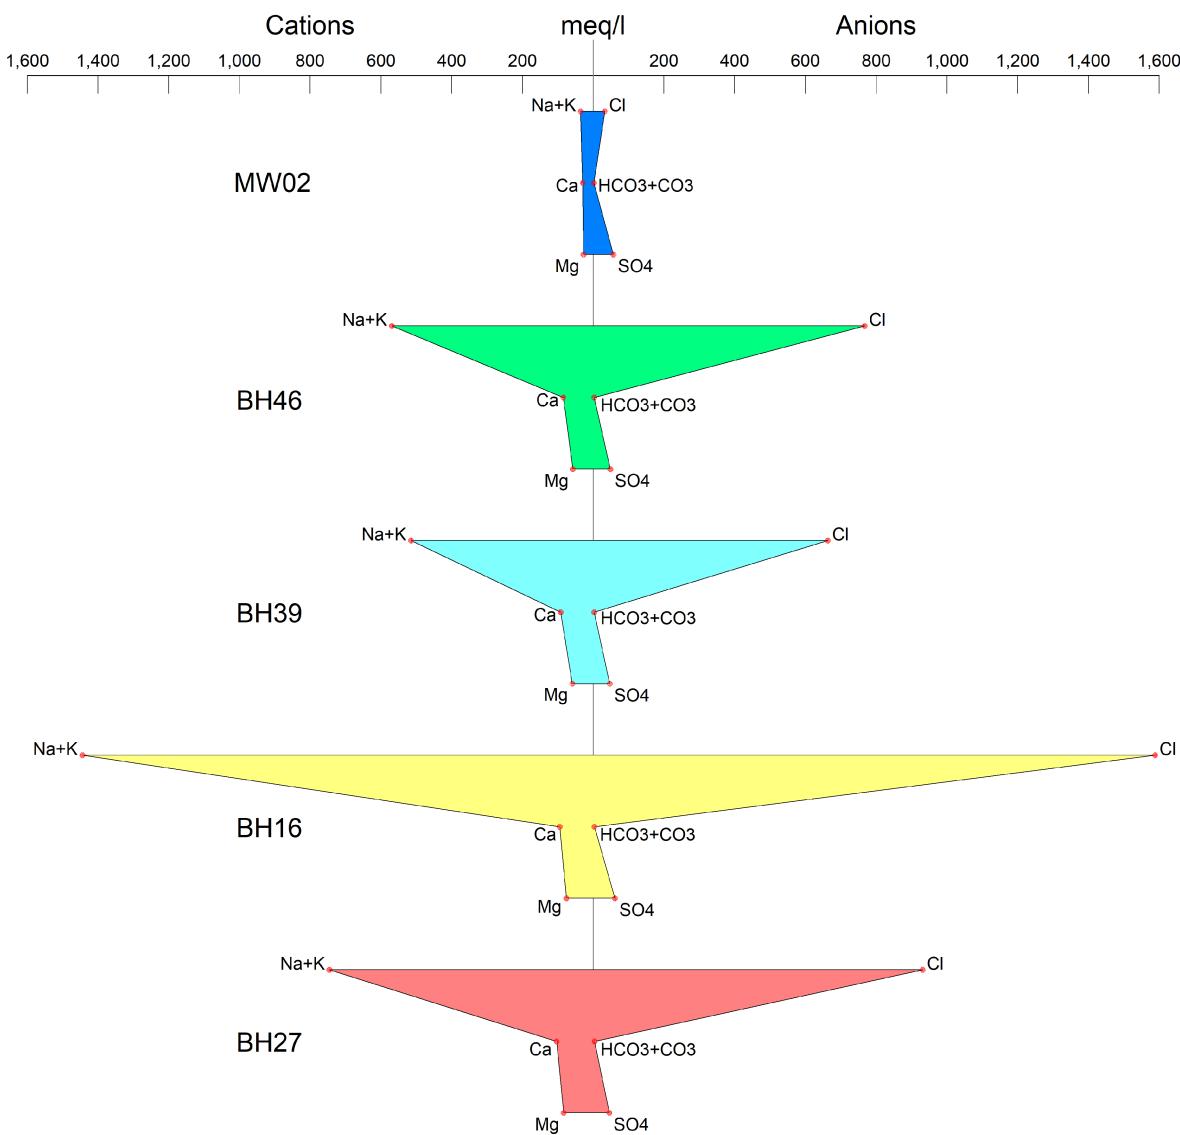

μg/L - micrograms per liter

mg/L - milligrams per liter

NE - not established

NMWQCC - New Mexico Water Quality Control Commission

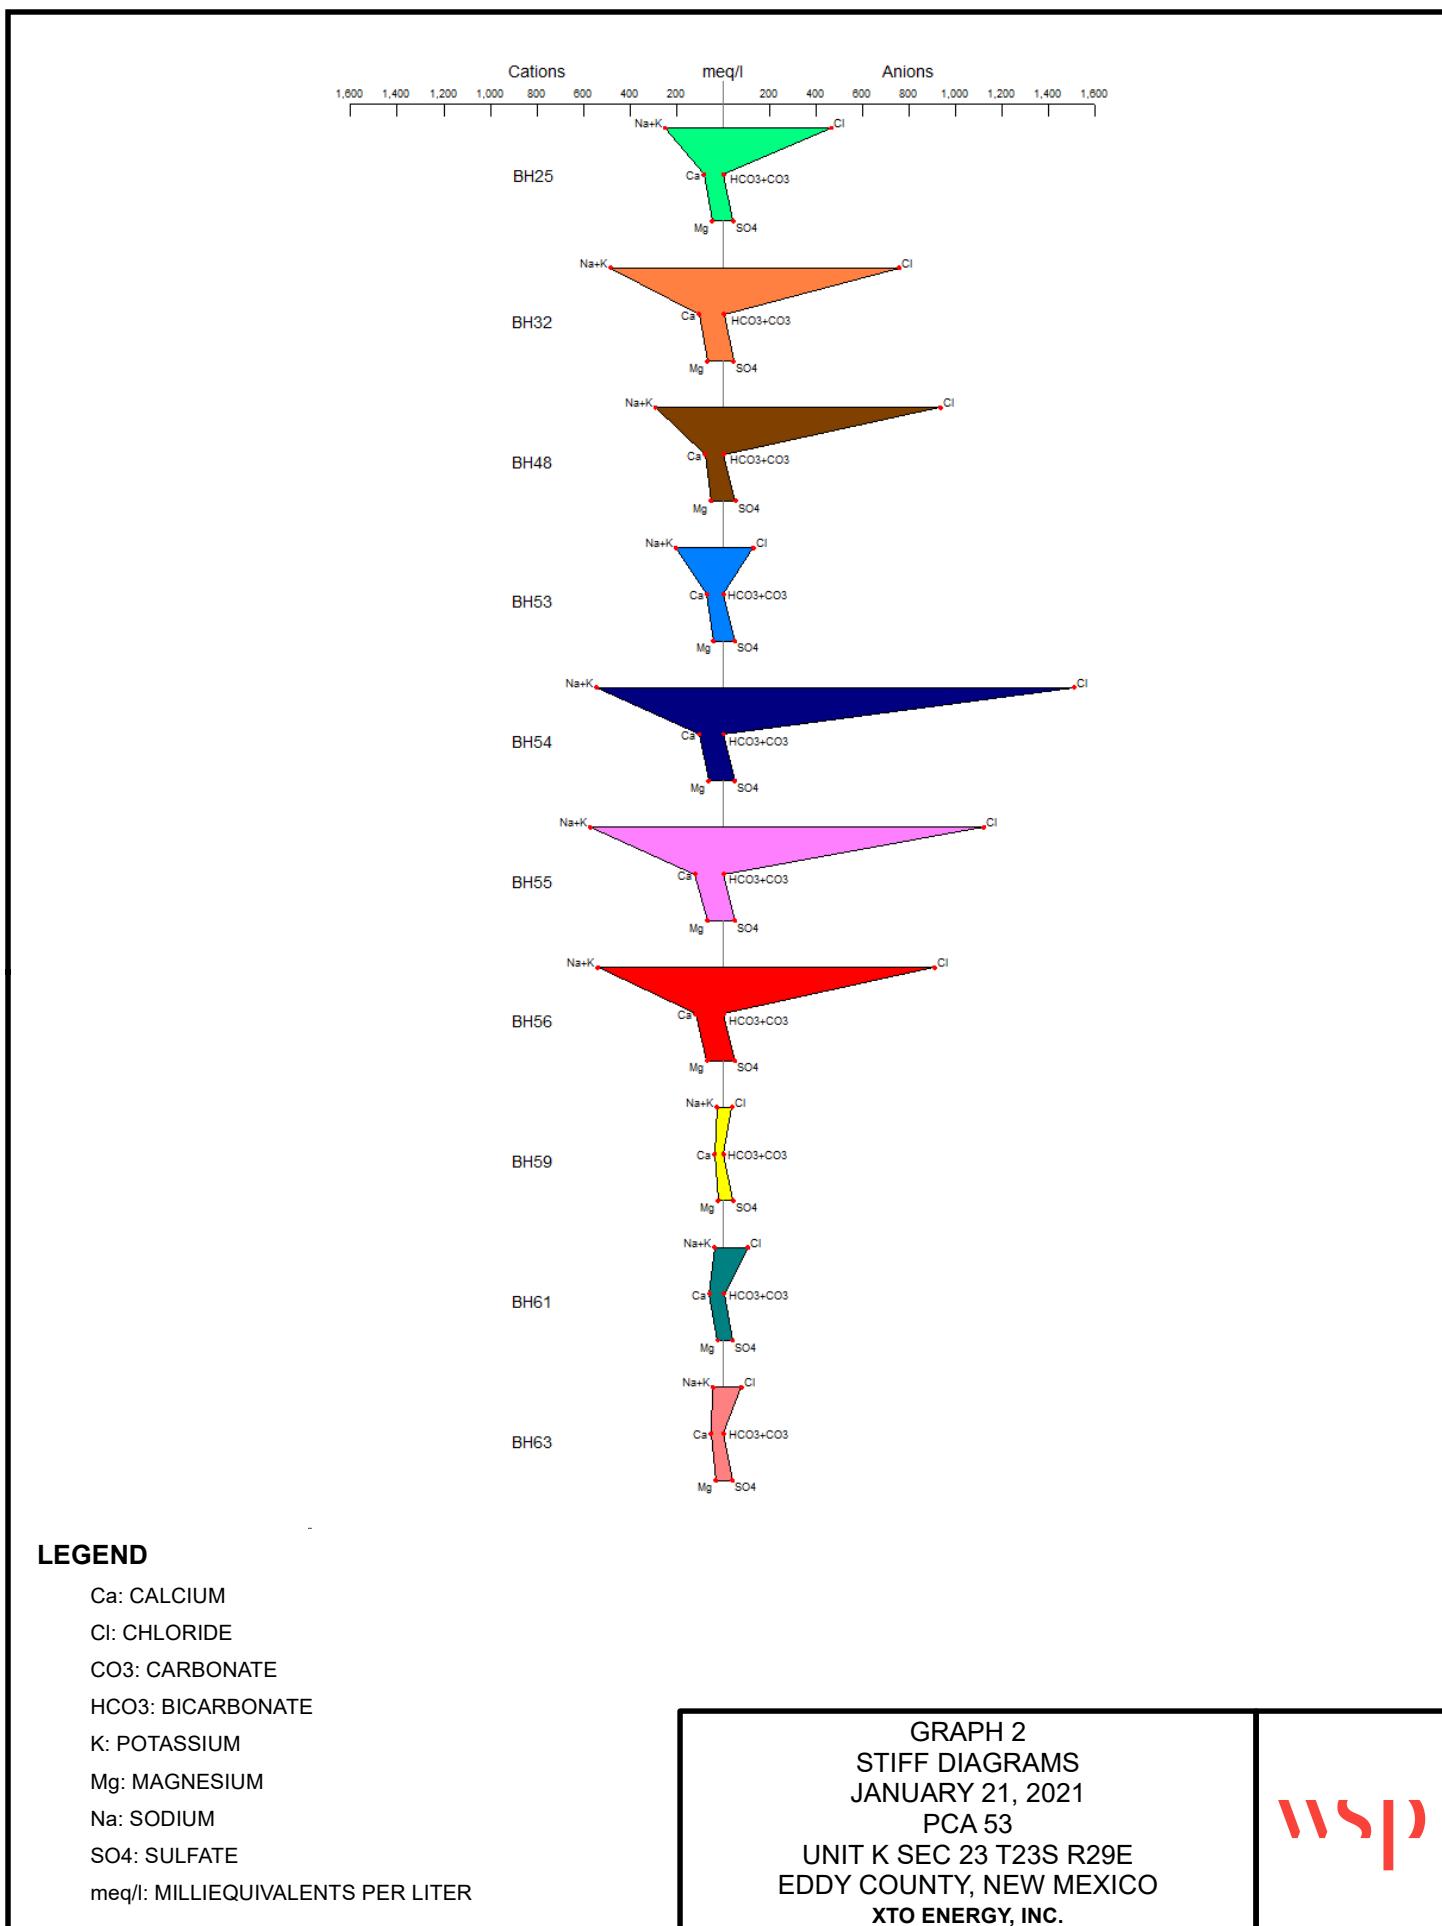

USEPA - United States Environmental Protection Agency

 <p>The diagram illustrates the monitoring well profile. It shows a vertical column with various soil horizons labeled by depth (0, 5', 10, 20', 30, 40, 50, 54', 58', 60'). Specific lithologies are identified at different depths: SILTY SAND (0-5'), CLAY (5'-10'), GYPSUM (10'-20'), CALICHE (20'-30'), DOLOMITE (30'-45'), and CLAY (45'-54'). A 2-inch PVC screen and riser are shown extending from 36' to 58' bgs. Bentonite chips are indicated in the annular space between 5 - 36' bgs. The total depth of the well is 58 feet bgs.</p>

Project Address:

**Dan Moir:**

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the Eurofins Xenco, LLC Report Number(s) 683993. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by Eurofins Xenco, LLC. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 683993 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting Eurofins Xenco, LLC to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink that reads "jessica kramer".

## Flagging Criteria

- X** In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.
- B** A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.
- D** The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.
- E** The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.
- F** RPD exceeded lab control limits.
- J** The target analyte was positively identified below the quantitation limit and above the detection limit.
- U** Analyte was not detected.
- L** The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.
- H** The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.
- K** Sample analyzed outside of recommended hold time.
- JN** A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

\*\* Surrogate recovered outside laboratory control limit.

**BRL** Below Reporting Limit.      **ND** Not Detected.

**RL** Reporting Limit

**MDL** Method Detection Limit      **SDL** Sample Detection Limit      **LOD** Limit of Detection

**PQL** Practical Quantitation Limit      **MQL** Method Quantitation Limit      **LOQ** Limit of Quantitation

**DL** Method Detection Limit

**NC** Non-Calculable

**SMP** Client Sample      **BLK**      Method Blank

**BKS/LCS** Blank Spike/Laboratory Control Sample      **BKSD/LCSD** Blank Spike Duplicate/Laboratory Control Sample Duplicate

**MD/SD** Method Duplicate/Sample Duplicate      **MS**      Matrix Spike      **MSD:** Matrix Spike Duplicate

+ NELAC certification not offered for this compound.

\* (Next to analyte name or method description) = Outside XENCO's scope of NELAC accreditation

 Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Project Address:

**Dan Moir:**

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the Eurofins Xenco, LLC Report Number(s) 684392. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by Eurofins Xenco, LLC. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 684392 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting Eurofins Xenco, LLC to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink that reads "jessica kramer".

## Flagging Criteria

- X** In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.
- B** A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.
- D** The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.
- E** The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.
- F** RPD exceeded lab control limits.
- J** The target analyte was positively identified below the quantitation limit and above the detection limit.
- U** Analyte was not detected.
- L** The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.
- H** The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.
- K** Sample analyzed outside of recommended hold time.
- JN** A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

\*\* Surrogate recovered outside laboratory control limit.

**BRL** Below Reporting Limit.      **ND** Not Detected.

**RL** Reporting Limit

**MDL** Method Detection Limit      **SDL** Sample Detection Limit      **LOD** Limit of Detection

**PQL** Practical Quantitation Limit      **MQL** Method Quantitation Limit      **LOQ** Limit of Quantitation

**DL** Method Detection Limit

**NC** Non-Calculable

**SMP** Client Sample      **BLK**      Method Blank

**BKS/LCS** Blank Spike/Laboratory Control Sample      **BKSD/LCSD** Blank Spike Duplicate/Laboratory Control Sample Duplicate

**MD/SD** Method Duplicate/Sample Duplicate      **MS**      Matrix Spike      **MSD:** Matrix Spike Duplicate

+ NELAC certification not offered for this compound.

\* (Next to analyte name or method description) = Outside XENCO's scope of NELAC accreditation

Notice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

Acceptable Temperature Range: 0 - 6 degC  
 Air and Metal samples Acceptable Range: Ambient  
 Temperature Measuring device used : T\_NM\_007

Sample Receipt Checklist	Comments
#1 *Temperature of cooler(s)?	1.2
#2 *Shipping container in good condition?	Yes
#3 *Samples received on ice?	Yes
#4 *Custody Seals intact on shipping container/ cooler?	Yes
#5 Custody Seals intact on sample bottles?	Yes
#6* Custody Seals Signed and dated?	Yes
#7 *Chain of Custody present?	Yes
#8 Any missing/extra samples?	No
#9 Chain of Custody signed when relinquished/ received?	Yes
#10 Chain of Custody agrees with sample labels/matrix?	Yes
#11 Container label(s) legible and intact?	Yes
#12 Samples in proper container/ bottle?	Yes
#13 Samples properly preserved?	Yes
#14 Sample container(s) intact?	Yes
#15 Sufficient sample amount for indicated test(s)?	Yes
#16 All samples received within hold time?	Yes
#17 Subcontract of sample(s)?	No
#18 Water VOC samples have zero headspace?	N/A
	Samples received in bulk containers.

\* Must be completed for after-hours delivery of samples prior to placing in the refrigerator

**PCA 53**

Project Address:

**Dan Moir:**

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the Eurofins Xenco, LLC Report Number(s) 684466. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by Eurofins Xenco, LLC. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 684466 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting Eurofins Xenco, LLC to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink that reads "Jessica Kramer".

## Flagging Criteria

- X** In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.
- B** A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.
- D** The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.
- E** The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.
- F** RPD exceeded lab control limits.
- J** The target analyte was positively identified below the quantitation limit and above the detection limit.
- U** Analyte was not detected.
- L** The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.
- H** The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.
- K** Sample analyzed outside of recommended hold time.
- JN** A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

\*\* Surrogate recovered outside laboratory control limit.

**BRL** Below Reporting Limit.      **ND** Not Detected.

**RL** Reporting Limit

**MDL** Method Detection Limit      **SDL** Sample Detection Limit      **LOD** Limit of Detection

**PQL** Practical Quantitation Limit      **MQL** Method Quantitation Limit      **LOQ** Limit of Quantitation

**DL** Method Detection Limit

**NC** Non-Calculable

**SMP** Client Sample      **BLK** Method Blank

**BKS/LCS** Blank Spike/Laboratory Control Sample      **BKSD/LCSD** Blank Spike Duplicate/Laboratory Control Sample Duplicate

**MD/SD** Method Duplicate/Sample Duplicate      **MS** Matrix Spike      **MSD:** Matrix Spike Duplicate

+ NELAC certification not offered for this compound.

\* (Next to analyte name or method description) = Outside XENCO's scope of NELAC accreditation

**Notice:** Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

**PCA 53**

Project Address:

**Dan Moir:**

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the Eurofins Xenco, LLC Report Number(s) 685400. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by Eurofins Xenco, LLC. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 685400 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting Eurofins Xenco, LLC to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink that reads "jessica kramer".

# CASE NARRATIVE

**Client Name: WSP USA****Project Name: PCA 53**

Project ID: **PCA 53 - TE012918187**  
Work Order Number(s): **685400**

Report Date: **02.02.2021**  
Date Received: **01.20.2021**

**Sample receipt non conformances and comments:****Sample receipt non conformances and comments per sample:**

None

**Analytical non conformances and comments:**

Batch: LBA-3149414 Metals, Total by SW846 6010C

Lab Sample ID 685400-013 was randomly selected for Matrix Spike/Matrix Spike Duplicate (MS/MSD).

Calcium, Magnesium recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate.

Potassium, Sodium recovered above QC limits in the Matrix Spike and Matrix Spike Duplicate. Outlier/s are due to possible matrix interference. Samples in the analytical batch are: 685400-013.

The Laboratory Control Sample for Magnesium, Calcium, Sodium, Potassium is within laboratory Control Limits, therefore the data was accepted.

## Flagging Criteria

- X** In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.
- B** A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.
- D** The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.
- E** The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.
- F** RPD exceeded lab control limits.
- J** The target analyte was positively identified below the quantitation limit and above the detection limit.
- U** Analyte was not detected.
- L** The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.
- H** The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.
- K** Sample analyzed outside of recommended hold time.
- JN** A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

\*\* Surrogate recovered outside laboratory control limit.

**BRL** Below Reporting Limit.      **ND** Not Detected.

**RL** Reporting Limit

**MDL** Method Detection Limit      **SDL** Sample Detection Limit      **LOD** Limit of Detection

**PQL** Practical Quantitation Limit      **MQL** Method Quantitation Limit      **LOQ** Limit of Quantitation

**DL** Method Detection Limit

**NC** Non-Calculable

**SMP** Client Sample      **BLK** Method Blank

**BKS/LCS** Blank Spike/Laboratory Control Sample      **BKSD/LCSD** Blank Spike Duplicate/Laboratory Control Sample Duplicate

**MD/SD** Method Duplicate/Sample Duplicate      **MS** Matrix Spike      **MSD:** Matrix Spike Duplicate

+ NELAC certification not offered for this compound.

\* (Next to analyte name or method description) = Outside XENCO's scope of NELAC accreditation

Ice: Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.

**PCA 53**

Project Address:

**Dan Moir:**

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the Eurofins Xenco, LLC Report Number(s) 685582. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by Eurofins Xenco, LLC. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 685582 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting Eurofins Xenco, LLC to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink that reads "Jessica Kramer".

## Flagging Criteria

- X** In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.
- B** A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.
- D** The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.
- E** The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.
- F** RPD exceeded lab control limits.
- J** The target analyte was positively identified below the quantitation limit and above the detection limit.
- U** Analyte was not detected.
- L** The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.
- H** The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.
- K** Sample analyzed outside of recommended hold time.
- JN** A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

\*\* Surrogate recovered outside laboratory control limit.

**BRL** Below Reporting Limit.      **ND** Not Detected.

**RL** Reporting Limit

**MDL** Method Detection Limit      **SDL** Sample Detection Limit      **LOD** Limit of Detection

**PQL** Practical Quantitation Limit      **MQL** Method Quantitation Limit      **LOQ** Limit of Quantitation

**DL** Method Detection Limit

**NC** Non-Calculable

**SMP** Client Sample      **BLK**      Method Blank

**BKS/LCS** Blank Spike/Laboratory Control Sample      **BKSD/LCSD** Blank Spike Duplicate/Laboratory Control Sample Duplicate

**MD/SD** Method Duplicate/Sample Duplicate      **MS**      Matrix Spike      **MSD:** Matrix Spike Duplicate

+ NELAC certification not offered for this compound.

\* (Next to analyte name or method description) = Outside XENCO's scope of NELAC accreditation

**Notice:** Signature of this document and relinquishment of samples constitutes a valid purchase order from client company to Xenco, its affiliates and subcontractors. It assigns standard terms and conditions of service. Xenco will be liable only for the cost of samples and shall not assume any responsibility for any losses or expenses incurred by the client if such losses are due to circumstances beyond the control of Xenco. A minimum charge of \$75.00 will be applied to each project and a charge of \$5 for each sample submitted to Xenco, but not analyzed. These terms will be enforced unless previously negotiated.
