

2021 ANNUAL GROUNDWATER MONITORING REPORT

D S HUGH SITE

LEA COUNTY, NEW MEXICO

UL-K, SECTION 26, T21S, R37E

PLAINS SRS#: 2000-10807

NMOCD NO.: 1R-0463

INCIDENT ID: NAPP2108838834

Review of 2021 ANNUAL GROUNDWATER MONITORING REPORT: Content satisfactory

Contractor recommendations approved by NMOCD and are as follows;

1. Continue PSH recovery from MW-1, RW-1, and RW-2 on a monthly basis (as applicable)
2. Removal of MW-2, MW-3, MW-6, and MW-7 from quarterly monitoring events.
3. Continue groundwater monitoring on a quarterly basis for MW-1, MW-4, MW-5, RW-1, and RW-2.
4. Continue groundwater monitoring and sampling on a quarterly basis
5. OCD approves the elimination of PAH sample collection from monitor well MW-1 and recovery wells RW-1 and RW-2
6. Conduct annual groundwater sampling of all wells at the site.
7. Collect PAH sample from recovery well RW-4 in 2022

Submit the Annual Monitoring Report to the NMOCD no later than March 31, 2023.

1.0 INTRODUCTION AND OBJECTIVES

1.1 Objectives and Site Background

On November 10, 2000, a 4-inch steel pipeline at the D S Hugh 4-inch gathering line site (Site) released approximately twenty (20) barrels (bbls) of crude oil into the subsurface. This pipeline was formerly owned by EOTT Energy, LLC (EOTT) and is currently owned by Plains Pipeline, L.P. (Plains). The Site is located in Unit Letter K, T21S, R37E, Section 26 of Lea County, New Mexico, approximately two (2) miles east of Eunice, New Mexico (**Figure 1**) or more specifically at latitude 32° 26' 48" N and longitude 103° 08' 07" W. The affected area was reported to be approximately 200-feet by 15-feet within the pipeline right-of-way (ROW). The leak that occurred at the Site on November 10, 2000, was apparently caused by corrosion of a pipeline. The release was reported by EOTT to Ms. Donna Williams at the New Mexico Oil Conservation Division (NMOCD) on November 10, 2000 at 2:25 P.M. Approximately five (5) bbls of product were reported as recovered out of the approximately 20-bbls reported released into the subsurface.

The leak was repaired and the affected soil was excavated and temporarily placed on a plastic liner. The initial response notification form (Form No. C-141), prepared by Plains, provides documentation of reporting the release to Larry Johnson with the NMOCD. Initial soil remediation activities were completed by Environmental Plus Inc. In April 2005, EarthCon Consultants, Inc. (EarthCon; formerly Premier Environmental Services Inc.) personnel completed an initial Site investigation for Plains. Details regarding the investigation were reported in EarthCon's 2005 Annual Report and are summarized below in Section 1.2.

This report summarizes the groundwater gauging activities, quarterly groundwater monitoring activities, and phase-separated hydrocarbons (PSH) recovery efforts that took place during 2021.

1.2 Previous Remedial Responses and Environmental Investigations

The previous environmental consultants for the DS Hugh Site were Environmental Plus Inc. and EarthCon. As of July 1, 2012, EnTech Consulting Corporation (EnTech) was retained by Plains to provide consulting services for the Site. Even though the environmental consultant for the Site has changed, the same personnel were hired by EnTech for historical knowledge, consistency, and to continue working at the Site.

Site delineation activities in 2005 included the installation of five (5) soil borings and collection of soil samples within and adjacent to the flow path of the release. Based on the findings of the September 2005 investigation, and the surface expression of the release, three (3) groundwater monitor wells (MW-1 through MW-3) were installed in December 2005. Total petroleum hydrocarbon (TPH) concentrations in soil from monitor well MW-1 were above 100 milligrams per kilogram (mg/kg) from the surface to the first water bearing zone at a depth of 45-feet below ground surface (bgs). A PSH sheen was observed in groundwater samples collected from monitor well MW-1. In May 2006, further soil investigation was conducted by EarthCon to delineate the extent of hydrocarbon contamination in soil. During this investigation, monitor wells MW-4 through MW-7 were installed (**Figure 2**).

A *Soil Remediation Plan* was submitted to and approved by the NMOCD in May 2006. The objective of the *Soil Remediation Plan* was to excavate the most contaminated soils, isolate and control residual chemicals of concern (COCs) in the soil and to prevent further impact to groundwater by the placement of an impermeable liner at the base of the excavation. The remediation plan was implemented in October 2006 and a *Soil Closure Report* was prepared by EarthCon and submitted in March 2007. Details of the activities can be found in the following reports submitted to the NMOCD:

- April 13, 2006 *Groundwater Delineation Investigation – March 2006* (letter report to Plains)
- May 2006 *Soil Remediation Plan*
- June 6, 2006 *Soil Investigation Results* (letter report to Plains)
- March 2007 *Soil Closure Report*

Quarterly groundwater monitoring was implemented for the Site in 2006 and continues to date. Groundwater PSH recovery was conducted on a weekly basis on monitor well MW-1. Monitor well MW-4 was initially gauged weekly in 2011 due to measurable amounts of PSH. Gauging of the well was reduced to a monthly basis when PSH was no longer observed. Approximately 1,335-gallons of water containing dissolved phase hydrocarbons and 70-gallons of entrained PSH were recovered from monitor well MW-1 in 2013. Approximately 70-gallons of PSH and 1,125-gallons total of affected groundwater were recovered from the wells containing PSH or sheen during 2014.

To increase the PSH recovery efforts at the Site, two (2) additional recovery wells were installed in August 2014 in the vicinity of monitor well MW-1 (RW-1 and RW-2).

Groundwater and PSH recovery for 2021 are presented below in Section 2. This report summarizes the activities conducted in 2021 for groundwater sampling and analysis and PSH recovery activities.

1.3 Regulatory Framework

Based on standards outlined in New Mexico Administrative Code (NMAC), Title 20, Chapter 6, Part 2, the remediation criteria for groundwater at the Site are as follows:

Chemical of Concern	Limit (mg/L)
Benzene	0.01
Toluene	0.75
Ethylbenzene	0.75
Total Xylenes	0.62
Polynuclear Aromatic Hydrocarbons (PAH) ^(1,2)	0.03

2021 GROUNDWATER MONITORING REPORT
DS HUGH SITE, LEA COUNTY, NEW MEXICOMARCH 2022
NMOCD No. 1R-0463

Chemical of Concern	Limit (mg/L)
Benzo-a-pyrene ⁽²⁾	0.0007

1 – PAHs: Total naphthalenes plus monomethylnaphthalenes

2 – PAH remediation standards will be used as target concentrations only upon PSH removal.

In addition to using the above values as the target cleanup goals for COC concentrations in groundwater at the Site, PSH removal is also an integral part of ongoing remediation activities.

1.4 Limitations

EnTech has examined and relied upon the historical information provided by Plains and their contractors, and conversations with Plains personnel and their contractors familiar with the Site. EnTech has not conducted an independent examination of the information contained in external project files or that provided by Plains or their contract personnel. EnTech has prepared this report using the level of care and professionalism in the industry for similar projects under similar conditions. EnTech believes the conclusions stated herein are factual, but no guarantee is made or implied.

2.0 GROUNDWATER ASSESSMENT AND RESULTS

2.1 Groundwater Sampling Methodology

Activities conducted at the Site in 2021 primarily consisted of gauging wells for groundwater levels, determining the presence or absence of PSH, and recovery of product using absorbent socks, hand bailing, and submersible pumps. Groundwater sampling of PSH-free monitor and recovery wells was also completed on a quarterly basis in 2021 to evaluate the extent of the dissolved-phase hydrocarbon plume.

Measurements of the depth to groundwater and product thickness in wells with hydrocarbon sheen or PSH were completed during the PSH recovery events and quarterly groundwater sampling events. Seven (7) monitor wells (MW-1 through MW-7) and two (2) recovery wells (RW-1 and RW-2) were gauged using an electronic oil/water interface probe. The well locations are shown on **Figure 2**.

Groundwater level elevations and the presence of PSH, if any, were noted for each well. In cases where no measurable PSH was detected by the interface probe, the downhole sensor of the probe was examined for the presence of PSH upon removal from the well. One (1) monitor well (MW-1), and two (2) recovery wells (RW-1 and RW-2), contained PSH during at least one gauging event in 2021, however not during the quarterly groundwater sampling events. Recovery wells RW-1 and RW-2 were sampled in all four (4) quarters of 2021, whereas monitor well MW-1 was sampled in the 1st, 2nd, and 3rd quarters of 2021 only due to the presence of sheen/PSH, in the 4th quarter. While a sheen was observed in recovery wells RW-1 and RW-2 during 2021, the recovery wells were sampled in all four (4) quarters as the sheen was not observed after groundwater purging and prior to sampling. Starting in the second quarter of 2008 all recovery and monitor wells with PSH or sheen were required to be sampled annually and analyzed for polycyclic aromatic hydrocarbons (PAH). Due to this requirement, groundwater samples were collected from monitor well MW-1 and recovery wells RW-1 and RW-2 during the second quarter of 2021 and analyzed for PAHs. A PAH sample was collected from MW-4 during 2021 to complete the requirement to have two consecutive samples collected below regulatory requirements. Per the approval of the NMOCD on January 12, 2022, PAH sampling will be discontinued in 2022 with the exception of MW-4, which will have a second annual sample collected. Based on the analytical results in 2022 for MW-4, the PAH samples may be proposed to be discontinued.

Except as noted above, groundwater monitor wells not exhibiting PSH or a hydrocarbon sheen were gauged and sampled quarterly. After collecting and recording groundwater levels and PSH thicknesses, each well was purged with a clean electric submersible pump or hand bailed using a clean disposable bailer, and then groundwater samples were collected using a new dedicated disposable bailer. Groundwater samples were analyzed for benzene, toluene, ethylbenzene, and total xylenes (BTEX) with select wells being analyzed for PAHs.

Groundwater samples were poured directly from the disposable bailers into the appropriate laboratory-supplied sample containers. The sample containers were then packaged to prevent

breakage, placed on ice in a cooler, and shipped to Pace Analytical of Mount Juliet, Tennessee for analysis. The groundwater samples were analyzed for BTEX by Environmental Protection Agency (EPA) Method SW 846-8260B and PAHs by EPA Method SW 8270C.

2.2 Groundwater Gauging

Table 1 summarizes groundwater gauging (elevation and PSH thickness) measurements taken before each quarterly groundwater sampling event in 2021. Groundwater elevations and PSH thickness measurements were taken in monitor well MW-1 and recovery wells RW-1 and RW-2 monthly in 2021. Monitor wells MW-2 through MW-7 were gauged on a quarterly basis in all of 2021. Groundwater elevation measurements were recorded quarterly for all monitor and recovery wells (MW-1 through MW-7, RW-1, and RW-2) in 2021. Complete historical groundwater elevation and PSH thickness measurements since September 21, 2005 are presented in **Table 2**. The groundwater elevation calculations are based on the top of polyvinyl chloride (PVC) well casing elevations, which were last surveyed on March 15, 2005 by EarthCon, the previous consultant.

2.3 Groundwater Gradient and Flow Direction

Using the groundwater gauging data summarized in **Table 1**, groundwater gradient maps were prepared and are included as **Figures 3A** through **3D**. The calculated groundwater gradient and estimated groundwater flow direction are based on the gauging data obtained on March 24, June 29, August 27, and December 2, 2021. The hydraulic gradient in 2021 ranged from 0.0005 to 0.0033 feet/foot (ft/ft), based on groundwater elevations measured between monitor wells MW-2 and MW-6. The groundwater gradient and flow direction to the east-southeast across the Site during 2021 were similar to the gradient and direction observed during the previous five (5) years.

2.4 Groundwater Analytical Results

Except for monitor well MW-1, due to presence of sheen/PSH in the fourth quarter of 2021, groundwater samples were collected from all monitor and recovery wells during each quarterly sampling event of 2021 (see **Table 3**). The monitor wells were purged by removing a minimum of three (3) to five (5) well volumes of groundwater, or depending on groundwater conditions, bailed dry three (3) times using a disposable bailer and allowed to recover to at least 80% of the initial volume before collecting samples. Groundwater samples were collected and transferred into laboratory-supplied sample containers. The sample containers were placed on ice in a cooler and shipped to Pace Analytical (Pace), in Mount Juliet, Tennessee for analysis. Groundwater samples were analyzed for BTEX using EPA Method SW-846 8260B. PAH analysis was performed on groundwater samples collected from monitor wells MW-1, and recovery wells RW-1 and RW-2 by EPA Method SW 8270C during the second quarterly sampling event and MW-4 during the third quarterly sampling event.

Groundwater samples were collected from all monitor and recovery wells during all four (4) quarters of 2021, except for MW-1, which was not sampled during the 4th quarter due to observed PSH. The quarterly sampling events are discussed in individual detail below.

First Quarter 2021

During the 1st quarterly sampling event, laboratory analysis of groundwater samples collected from recovery well RW-1 indicated benzene concentrations above the NMOCD criteria of 0.01 milligrams per Liter (mg/L). Benzene concentrations were analyzed at nondetectable levels or below the NMOCD criteria of 0.01 mg/L in all other monitor and recovery wells. Toluene, ethylbenzene, and total xylenes concentrations in groundwater samples collected from all monitor wells in the 1st quarterly sampling event occurred at non-detectable levels or levels below the NMOCD remediation criteria.

Second Quarter 2021

During the 2nd quarterly sampling event, laboratory analysis of groundwater samples collected from monitor well MW-1 indicated benzene concentrations above the NMOCD criteria of 0.01 mg/L. Benzene concentrations were analyzed at nondetectable levels or below the NMOCD criteria in all other monitor and recovery wells. Toluene, ethylbenzene, and total xylenes concentrations in groundwater samples collected from all monitor wells in the 2nd quarterly sampling event occurred at non-detectable levels or levels below the NMOCD remediation criteria. Laboratory analysis of PAHs in groundwater samples collected from monitor well MW-1 and recovery wells RW-1 and RW-2 indicated concentrations below the New Mexico Water Quality Standards.

Third Quarter 2021

During the 3rd quarterly sampling event, laboratory analysis of groundwater samples collected from monitor well RW-2 indicated benzene concentrations above the NMOCD criteria of 0.01 mg/L. Laboratory analysis of groundwater samples collected from monitor wells MW-1 through MW-7 and recovery well RW-1 indicated benzene, toluene, ethylbenzene, and total xylene concentrations below the NMOCD remediation criteria. Laboratory analysis of PAHs in groundwater samples collected from monitor well MW-4 indicated concentrations below the New Mexico Water Quality Standards

Fourth Quarter 2021

A groundwater sample was not collected from monitor well MW-1 due to measurable PSH. Benzene concentrations were analyzed at nondetectable levels in all monitor and recovery wells. Toluene, ethylbenzene, and total xylenes concentrations in groundwater samples collected from all monitor wells in the 4th quarterly sampling event occurred at non-detectable levels or levels below the NMOCD remediation criteria.

The 2021 analytical results are presented in **Table 3**, and historical analytical results are presented in **Table 4**. **Table 2.4.1** below summarizes the benzene concentrations that were observed in 2021. Benzene concentrations reported in exceedance of NMOCD standards are marked in **bold**.

Table 2.4.1				
2021 COC Concentrations (mg/L)				
2021	First Quarter	Second Quarter	Third Quarter	Fourth Quarter
	Benzene	Benzene	Benzene	Benzene
NMOCD Remediation Criteria (mg/L)	0.01	0.01	0.01	0.01
MW-1	0.00568	0.0205	0.00504	NS
RW-1	0.0147	0.00756	<0.001	0.00290
RW-2	<0.001	<0.001	0.0234	<0.001

Note: Concentrations in **bold** indicate exceedances of NMOCD Remediation criteria.

NS – Not sampled due to PSH sheen or measurable thickness.

The 2021 laboratory analytical reports are provided in **Appendix A**. The groundwater analytical data and PSH thickness data for each quarterly sampling event for 2021 are presented in **Figures 4A through 4D**.

From 2008 through 2021, NMOCD required Plains to analyze for BTEX and PAH constituents in the dissolved phase groundwater in wells with hydrocarbon sheen or wells that exceed NMOCD remediation standards. To meet this requirement groundwater samples were collected from monitor wells MW-1 and recovery wells RW-1 and RW-2 during the second quarter and analyzed for BTEX constituents (see **Tables 3 and 4** for analytical data) as well as PAHs (see **Table 5**). The NMOCD requires annual PAH analysis be conducted on each monitor well until laboratory analysis indicates the PAH concentrations are below the NMOCD remediation criteria for the constituent sampled. PAH samples were collected in MW-4 during 2021 and will be collected in 2022 to complete two consecutive groundwater samples events without exceedances. Groundwater sampling for PAH will be discontinued on the remaining wells at the site as PAH concentrations have remained below NMOCD remediation criteria for a minimum of two consecutive years. Per the approval of the NMOD on January 12, 2022, PAH sampling will be discontinued in 2022 with the exception of MW-4, which will have a second annual sample collected. Based on the analytical results of the 2022 for MW-4, the PAH samples may be proposed to be discontinued.

Copies of the laboratory analytical data packages are included in **Appendix A**.

2.5 Groundwater Waste Disposal

Purge water from well sampling at wells MW-1 through MW-7 and RW-1 and RW-2 is placed in the 1,100-gallon above ground storage tank (AST). These liquids are vacuumed from the tank and transported off-Site for disposal by Gandy Corporation of Lovington, New Mexico.

3.0 PSH RECOVERY

3.1 PSH Recovery Methodology

In addition to collecting groundwater samples on a quarterly basis in 2021, EnTech performed monthly visits to the Site to gauge and recover PSH from three (3) wells with PSH/sheen (MW-1, RW-1 and RW-2). Measurements of PSH and water levels were recorded during each Site visit (see **Table 2**). PSH recovery activities were completed using submersible pumps, hand bailer and/or absorbent socks. Routine PSH recovery activities typically consisted of the removal of less than 1-gallon of PSH and 10 to 20-gallons of groundwater with possible dissolved phase hydrocarbons from each well. Measurable PSH was observed in monitor well MW-1 during 2021 ranging in thickness from a sheen to 0.07-foot. A sheen of PSH was also observed in recovery wells RW-1 and RW-2 during at least one (1) quarterly sampling event.

3.2 PSH Recovery via Pumping and Manual Bailing

During 2021, PSH ranging from a sheen to a measurable thickness was observed in monitor well MW-1 and a sheen only in recovery wells RW-1 and RW-2. In general, stable or slightly fluctuating trends in the PSH thickness has been observed for these wells. Monthly recovery data for PSH and dissolved phase groundwater are presented in **Table 6**.

A stable to slightly fluctuating trend in the PSH thickness in monitor well MW-1 was observed during 2021 ranging from a sheen to 0.07-foot.

A stable to slightly fluctuating trend in the PSH thickness in recovery well RW-1 and RW-2 was observed in 2021. The maximum PSH thicknesses in these two (2) recovery wells occurred as a sheen.

3.3 PSH Waste Disposal

PSH was observed during recovery events in 2021. Approximately 0.50-gallons of PSH and 404.50-gallons of affected groundwater was recovered from the wells containing PSH. These liquids are stored in an 1,100-gallon AST on-Site until collected and transported for off-Site disposal by Gandy Corporation of Lovington, New Mexico.

4.0 MONITORED NATURAL ATTENUATION

4.1 Regulatory Framework for Monitored Natural Attenuation

Monitored Natural Attenuation (MNA) is defined by the New Mexico Environmental Department (NMED) in 20.5.13 NMAC as “a methodology for remediation that relies upon a variety of naturally occurring chemical, physical and biological processes to achieve target concentrations in a manner that is equally as protective of public health, safety and welfare, and the environment as other methods and that is accompanied by a program of monitoring to document the process and results of the above mentioned processes.”

As part of the MNA process several lines of evidence need to be evaluated. The general lines of evidence are listed below:

- **Primary Lines of Evidence (PLOE).** Relies on use of historical groundwater data that demonstrate a clear trend of stable or decreasing chemical of concern (COC) concentrations over time and with distance away from the source at appropriate monitoring or sampling points.
- **Secondary Lines of Evidence (SLOE).** Uses geochemical indicators to document certain geochemical signatures or “footprints” in the groundwater that demonstrated (indirectly) the type of natural attenuation process(es) occurring at the affected property and the destruction of COCs; or uses distance-based/time-based/biodegradation rate calculations to demonstrate attenuation.
- **Other Lines of Evidence (OLOE).** Most often consists of predictive modeling studies and other lab/field studies that demonstrate an understanding of the natural attenuation process(es) occurring at the affected property and their effectiveness in controlling protective concentration limit exceedance (PCLE) zone migration and decreasing COC concentrations.

4.2 Monitored Natural Attenuation Information

The DS Hugh Site is currently undergoing Plume Stability Analysis (PSA). Analyses for geochemical parameters, such as dissolved oxygen (DO), nitrate (NO₃⁻), sulfate (SO₄²⁻), and ferrous iron (Fe²⁺), for monitor/recovery wells MW-1, MW-3, MW-6, and MW-7. Hach® Test Kits and colorimeter were used to measure DO, NO₃⁻, SO₄²⁻ and Fe²⁺. A YSI Multimeter Sonde was used to measure DO, oxidation reduction potential (ORP), potential of hydrogen (pH), conductivity, and specific conductivity, to determine stabilization per the low flow sampling protocol. These measurements are summarized in Table 9, Appendix B.

The water quality parameters were analyzed to determine if the prevailing conditions in the subsurface environment are aerobic or anaerobic and whether sufficient nutrients are present for microbial growth. The following is a summary of key observations stemming from the geochemical analyses.

- Field measurements indicate that ORP in the wells within the affected area around recovery well MW-1 is relatively low. This correlates with low DO concentrations in these same wells.
- The pH appears to be mostly neutral, ranging from 6.58 to 6.99.
- Ferrous iron concentrations ranged from 0.00 mg/L to 0.45 mg/L in the groundwater samples collected during the second quarter sampling event of 2021. The maximum concentration was observed in the groundwater sample collected from monitor well MW-1.

MNA is defined as monitoring the reduction in mass or concentration of a COC over time or distance from the source of a COC due to naturally occurring physical, chemical and biological processes, such as: biodegradation, dispersion, dilution, adsorption, and volatilization. These parameters help determine if prevailing conditions in the subsurface environment are aerobic or anaerobic and whether sufficient nutrients are present for microbial growth. Knowledge of existing subsurface conditions will help better evaluate the effects of air injection and microbial activity at the Site through time

Additional MNA evaluation for the site has been completed and additional PLOEs exist and include:

- The benzene concentrations reported in the groundwater samples collected from the monitor wells down-gradient of the plume (MW-6 and MW-7) from 2007 through 2021 were below the NMOCD Remediation Criteria;
- Benzene concentrations reported in the groundwater samples collected from cross-gradient monitor wells (MW-2 and MW-5) from 2010 through 2021, were below the NMOCD Remediation Criteria; and,
- Benzene concentrations analyzed in the groundwater samples collected from monitor well MW-1 and recovery well RW-2 during at least one (1) quarterly sampling event in 2021, exceeded the NMOCD criteria of 0.01 mg/L.

Understanding plume stability is an important step in the remedial planning process for a Site. For instance, an increasing plume could potentially migrate to human or environmental receptors, whereas a stable or decreasing plume may not pose an imminent threat to human health and the environment. An introduction to plume stability analysis and the basis for the plume evaluation at the Site was presented in the 2009 Annual report. This analysis is conducted periodically in order to understand the overall stability of the benzene plume during 2006 through 2021. This report includes the development of benzene concentration isopleths maps for each year and performance of Mann-Kendall Trend Test (MKTT).

The benzene concentrations utilized for the 2021 concentration isopleth map (**Figure 11**) were developed from the average of the benzene concentrations reported in the four (4) quarterly groundwater sampling events and was used for all the PSH-free monitor wells (monitor wells MW-

2 through MW-7, and recovery wells RW-1 and RW-2). The benzene concentrations reported in groundwater samples collected from monitor well MW-1 in the first, second and third quarterly sampling events were averaged for 2021.

The benzene isopleth maps for 2015 through 2021 are presented in **Figures 5 through 11**, respectively.

4.3 Mann-Kendall Analysis

The Mann-Kendall True Trend is a statistical method used to analyze data collected over time for consistently increasing or decreasing trends. It is a non-parametric test, which means it works for all distributions (i.e. the data doesn't have to meet the assumption of normality), but the data should have no serial correlation.

The test can be used to find trends for as few as four (4) samples. However, with only a few data points, the test has a high probability of not finding a trend when one would be present if more points were provided. The more data points available, the more likely the test is going to find a true trend. The minimum number of recommended measurements is therefore at least eight (8) to ten (10) (Reference: Prashanth Khambhammettu: "Mann-Kendall Analysis for the Fort Ord Site", HydroGeoLogic, Inc.-OU-1 2004 Annual Groundwater Monitoring Report-Fort Ord, California, 2005).

Concentrations of benzene analyzed in groundwater samples collected from the Site between June 6, 2014 and December 2, 2021 were evaluated using the MKTT. Only monitor wells with detectable concentrations of benzene were evaluated.

Wells evaluated by MKTT for benzene included monitor well MW-1 and recovery wells RW-1 and RW-2. The confidence factor [CF] of each analyte and monitor/recovery well is listed the table below for wells with detectable concentrations of benzene.

Benzene Evaluation		
Well ID	Confidence Factor	Trend
MW-1	65.1%	Stable
RW-1	69.6%	No trend
RW-2	90.7%	Prob. Decreasing

A copy of the MKTT analysis is included in **Appendix B**.

As a final line of evidence, the dissolved phase plume was evaluated by analyzing groundwater samples collected quarterly from six (6) PSH-free monitor wells. A review of the data indicates:

2021 GROUNDWATER MONITORING REPORT
DS HUGH SITE, LEA COUNTY, NEW MEXICO

MARCH 2022
NMOCD No. 1R-0463

- Nondetectable benzene concentrations or concentrations below the NMOCD criteria from March 1, 2007 through December 21, 2021 for monitor wells MW-2, MW-3, and MW-5 through MW-7; and,
- Nondetectable benzene concentrations or concentrations below the NMOCD criteria from September 11, 2012 through March 8, 2018, for monitor well MW-4. Analysis for this same well from the sampling events of August 28, 2018, November 30, 2018, and August 28, 2019 indicated benzene concentrations above the NMOCD Remediation Criteria. Concentrations have been below the NMOCD Remediation Criteria or laboratory detection limits from November 20, 2019 through December 2, 2021

5.0 FINDINGS

Findings and recommendations resulting from 2021 groundwater monitoring at the DS Hugh Site are summarized below.

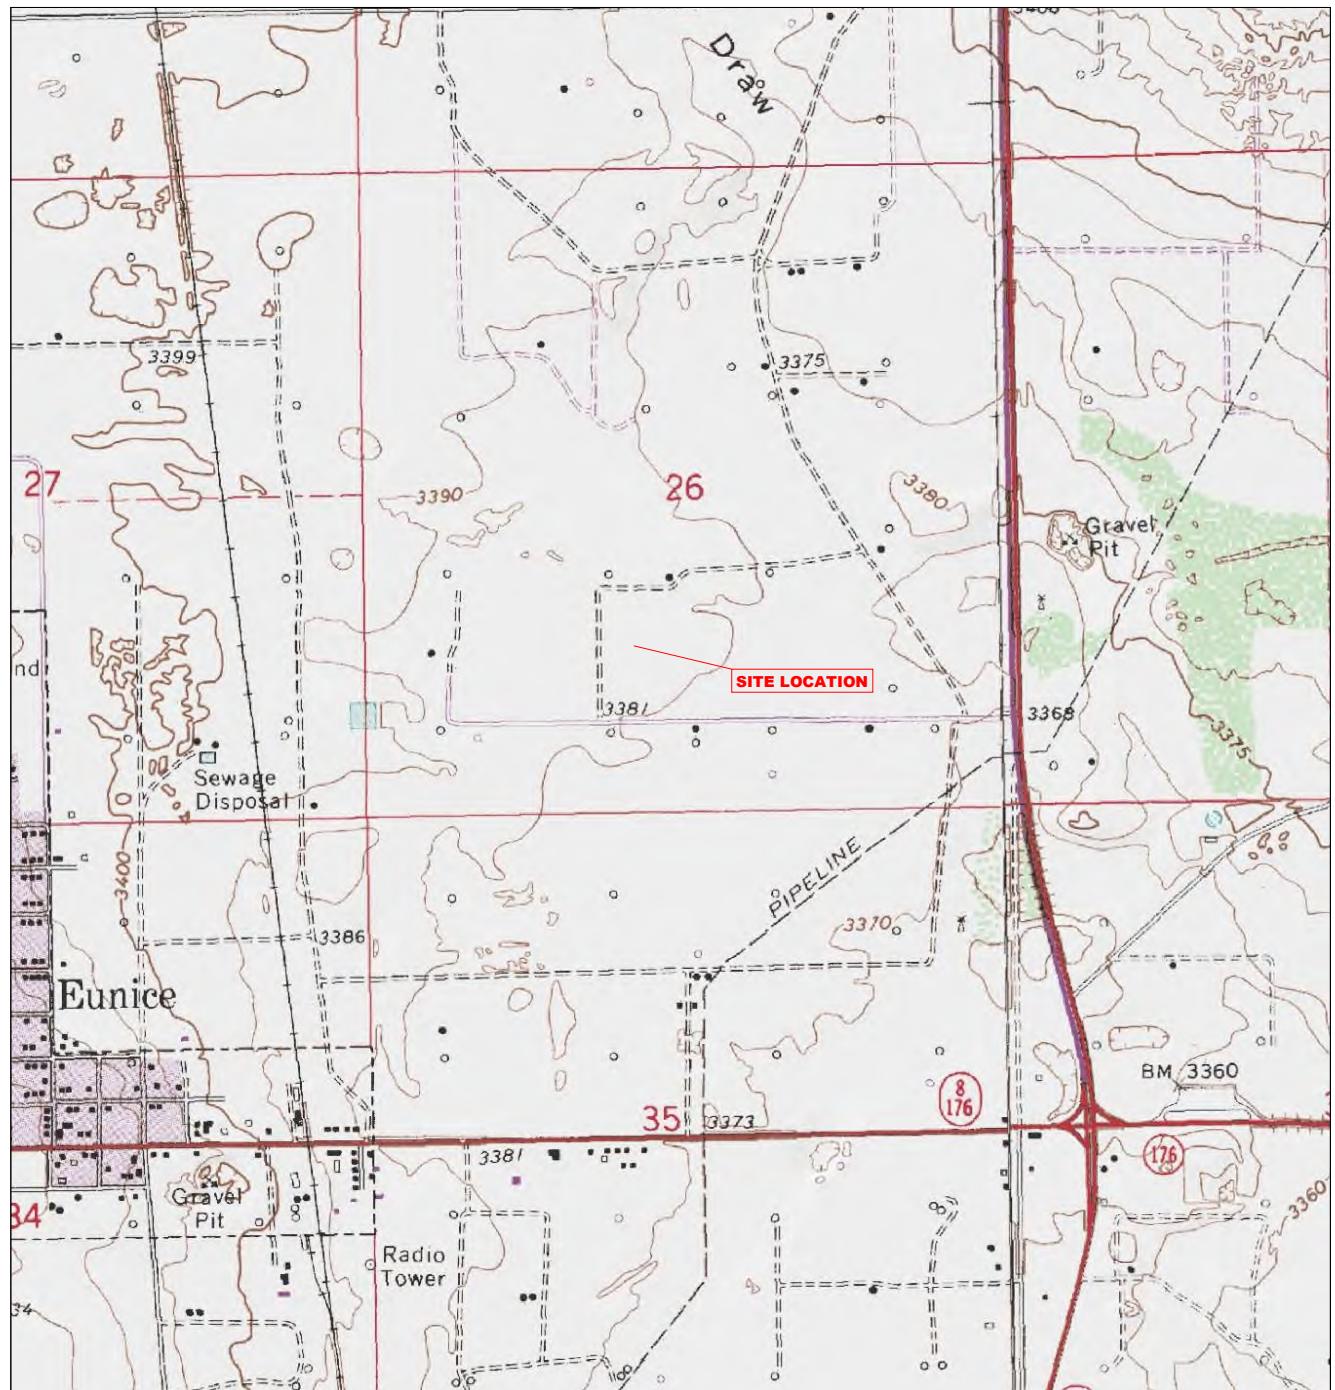

- Groundwater flow in the uppermost groundwater-bearing unit is to the east-southeast ranging from 0.0005 to 0.0033 ft/ft as measured between wells MW-2 and MW-6.
- Analytical results reported for the groundwater samples collected at six (6) monitor wells (MW-2 through MW-7) displayed benzene concentrations below the NMOCD Remediation Criteria for all four (4) quarters of 2021. Laboratory analysis of the groundwater samples collected from recovery well RW-1 indicated benzene concentrations above the NMOCD Remediation Criteria during the first quarterly sampling event but below the NMOCD Remediation Criteria for the balance of 2021. RW-2 indicated benzene concentrations above the NMOCD Remediation Criteria during the third quarterly sampling event but below the NMOCD Remediation Criteria for the balance of 2021. Monitor well MW-1 had benzene concentrations above the NMOCD Remediation Criteria during the second quarterly sampling event and was not sampled during the fourth quarter sampling event of 2021 due to measurable PSH.
- PSH recovery from monitor well MW-1 and recovery wells RW-1 and RW-2 continued during 2021, and the volume recovered appears to have significantly diminished since 2019. PSH recovery of visible sheens or measurable thicknesses was completed during 2021 and approximately 0.50-gallons of PSH and 404.5-gallon of impacted groundwater was collected.
- The PSH plume has remained in the historical source area, located in the vicinity of well MW-1 and does not appear to be migrating downgradient.

Based on PSH recovery data and groundwater sampling completed during 2021 (and previously) at the Site, EnTech recommends the following:

- PSH recovery from monitor well MW-1 and recovery wells RW-1 and RW-2 should continue on a monthly basis (as applicable).
- Removal of monitor wells MW-2, MW-3, MW-6 and MW-7 from quarterly monitoring events.
- Groundwater monitoring should continue on a quarterly basis for monitor wells MW-1, MW-4, MW-5 and recovery wells RW-1 and RW-2.
- Annual groundwater sampling of all wells at the site.
- A PAH sample will be collected from recovery well RW-4 in 2022. If analytical data confirms that no exceedances of the NMOCD remediation criteria, PAH samples will be proposed to be discontinued in 2023.

NMOCD: New Mexico Oil Conservation District

Exceedences of NMOCD Remediation Criteria are shown in **bold**

NA: Not analyzed

J: Analyte detected below method detection limit (MDL) but above sample detection limit (SDL)

^a Result is from Run #2

P: Dual Column results percent difference > 40%

* MW-7 was not sampled in 4th Quarter 2008, due to root growth in the well

ANALYTICAL REPORT

April 06, 2021

¹Cp²Tc³Ss⁴Cn⁵Sr⁶Qc⁷Gl⁸Al⁹Sc

Plains All American Pipeline

Sample Delivery Group: L1331413
 Samples Received: 03/26/2021
 Project Number: PAA12003
 Description: DS Hugh
 Site: SRS - 2000-10807
 Report To:
 Kathleen Buxton
 21 Waterway Ave., Suite 300
 The Woodlands, TX 77380

Entire Report Reviewed By:

Mark W. Beasley
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

¹Cp²Tc³Ss⁴Cn⁵Sr⁶Qc⁷Gl⁸Al⁹Sc

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.	1 Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	2 Tc
RDL	Reported Detection Limit.	3 Ss
Rec.	Recovery.	4 Cn
RPD	Relative Percent Difference.	5 Sr
SDG	Sample Delivery Group.	6 Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	7 GI
U	Not detected at the Reporting Limit (or MDL where applicable).	8 AI
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	9 Sc
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	
Qualifier	Description	
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier Description

J1	Surrogate recovery limits have been exceeded; values are outside upper control limits.
J3	The associated batch QC was outside the established quality control range for precision.

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Mann-Kendall Statistic (S):	-9	-17	-39	
Confidence Factor:	65.1%	69.6%	90.7%	
Concentration Trend:	Stable	No Trend	Prob. Decreasing	

Notes:

- At least four independent sampling events per well are required for calculating the trend. Methodology is valid for 4 to 40 samples.
- Confidence in Trend = Confidence (in percent) that constituent concentration is increasing ($S>0$) or decreasing ($S<0$): $>95\% =$ Increasing or Decreasing; $\geq 90\% =$ Probably Increasing or Probably Decreasing; $< 90\% \text{ and } S>0 =$ No Trend; $< 90\%, S\leq 0,$ and $COV \geq 1 =$ No Trend; $< 90\% \text{ and } COV < 1 =$ Stable.
- Methodology based on "MAROS: A Decision Support System for Optimizing Monitoring Plans", J.J. Aziz, M. Ling, H.S. Rifai, C.J. Newell, and J.R. Gonzales, *Ground Water*, 41(3):355-367, 2003.
- Nondetectable concentrations listed as 0.0009 mg/L (i.e., $<0.001 \text{ mg/L}$) and indicated in italicized bold red values.
- All concentrations in milligrams per liter (mg/L).

CONDITIONS

Operator: PLAIN MARKETING L.P. 333 Clay Street Suite 1900 Houston, TX 77002	OGRID: 34053
	Action Number: 92070
	Action Type: [UF-GWA] Ground Water Abatement (GROUND WATER ABATEMENT)

CONDITIONS

Created By	Condition	Condition Date
nvelez	Contractor recommendations approved by NMOCD and are as follows; 1. Continue PSH recovery from MW-1, RW-1, and RW-2 on a monthly basis (as applicable) 2. Removal of MW-2, MW-3, MW-6, and MW-7 from quarterly monitoring events. 3. Continue groundwater monitoring on a quarterly basis for MW-1, MW-4, MW-5, RW-1, and RW-2. 4. Continue groundwater monitoring and sampling on a quarterly basis 5. OCD approves the elimination of PAH sample collection from monitor well MW-1 and recovery wells RW-1 and RW-2 6. Conduct annual groundwater sampling of all wells at the site. 7. Collect PAH sample from recovery well RW-4 in 2022 8. Submit the Annual Monitoring Report to the NMOCD no later than March 31, 2023.	8/2/2022
