2023 ANNUAL GROUNDWATER MONITORING REPORT

Vacuum to Jal 14” Mainline #5
Lea County, New Mexico
UL-A, Section 2, T22S, R37E
NMOCD No.: 1R-0464
.: 2003-00134
PP2108847697

Review of the 2023 Annual Groundwater Monitoring Report for Vacuum to Jal 14" Mainline #5: content satisfactory.
1. Plains has continued to remove LNAPL/PSH on a monthly basis from recovery wells: RW-1 through RW-3, RW-8 if present.
2. Approximately 22 gallons of PSH was removed from applicable wells and affected groundwater and transported off-site by Gandy Corporation as the hauler.
3. Please indicate which facility this is going to for disposal on the 2024 annual monitoring report, as there is not one listed in the report.
4. Continue to sample on a semi-annual basis for MW-1, MW-2, MW-4, MW-6, MW-7, RW-5, RW-6
5. Conduct quarterly sampling of monitoring wells MW-3, MW-5, and RW 1, RW-2, RW-3, and RW-8, if there is no measureable PSH. PAHs may be discontinued for sampling after 2 consecutive years--eight (8) quarters total for ND results or substantially below the WQCC human health standards.
6. Submit the 2024 annual report to OCD by June 4, 2024.

1.0 INTRODUCTION AND OBJECTIVES

1.1 Objectives and Site Information

EnTech Consultants (EnTech) prepared this Annual Report on behalf of Plains Pipeline, L.P. (Plains) for the Vacuum to Jal 14" Mainline #5 release area (Site), located in T22S, R37E, Section 2 of Lea County, New Mexico. The Site is located approximately two (2) miles east of Eunice, New Mexico, and more specifically at latitude 32° 25' 39.006" and longitude 103° 07' 43.155" (**Figure 1**). The hydrocarbon impact at the Site is the result of a 20-barrel (bbl) crude oil release which occurred from the pipeline on May 23, 2003. The pipeline was owned by EOTT Energy, LLC (EOTT) at the time of the release and is currently owned by Plains.

This Report presents the data collected at the Site during weekly, bi-weekly, and monthly groundwater gauging and phase separated hydrocarbon (PSH) recovery and four (4) quarterly groundwater sampling events conducted during 2023. The objective of the on-going quarterly groundwater sampling activities at the Site is to monitor the concentration of chemicals of concern (COCs) in the affected groundwater. PSH recovery activities are conducted to remove residual crude oil from the groundwater.

EnTech was retained by Plains in 2012 to manage continued remediation activities at the Site. According to the initial New Mexico Oil Conservation Division (NMOCD) Response Notification (NMOCD Form C-141), Mr. Pat McCasland of Environmental Plus, Inc. (EPI) reported the Release, on behalf of Mr. Frank Hernandez of EOTT on May 23, 2003. A copy of the C-141 Release Notification Form was provided in the 2010 Annual Report Dated March 2011. The Release was apparently caused by internal or external corrosion. The line was being pressure tested when the Release occurred.

1.2 Previous Remedial Responses and Environmental Investigations

The previous environmental consultant for the Site was EarthCon Consultants, Inc. (EarthCon). As of July 1, 2012, EnTech was retained by Plains for consulting services for the Site. Even though the environmental consultant for the Site has changed, the same personnel were retained by EnTech to complete work for the Site.

EPI oversaw the initial emergency response activities at the Site in May and June of 2003. According to EPI documents, the May 2003 release resulted in surface impacts in two (2) areas which required excavation. The larger of the excavations was an irregularly shaped area measuring approximately 40-feet by 200-feet and affected a surface area of approximately 8,885-square feet (ft^2). The smaller area had an L-shaped footprint located east of the southernmost portion of the larger excavation which measured approximately 40-feet by 60-feet and affected a surface area of approximately 2,500-ft^2. The EPI data also revealed the presence of a historical spill at the Site identified by the presence of an

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

asphaltene layer which affected an area in the central portion of the larger excavation directly under the existing pipelines.

Based on the information provided by Mr. McCasland and file correspondence between EPI and Plains, approximately 1,466-cubic yards (yds^3) of heavily impacted surface soils were transported off-Site for treatment at the Lea Station Land Farm in March 2004. The remaining excavated soil was spread out adjacent to the excavation. In March 2004, EPI installed four (4) trenches in areas of known hydrocarbon-impact to further delineate depths of contamination and to determine if the base of the excavation was contaminated.

In January 2006, EarthCon collected twelve (12) composite soil samples from the excavated material to evaluate the concentration of hydrocarbons remaining. In March 2006, EarthCon oversaw the installation of three (3) soil borings which were subsequently converted to monitor wells (MW-1 through MW-3) at the Site. Following the installation of the three (3) monitor wells, EarthCon began weekly gauging and PSH recovery, and quarterly groundwater sampling activities at the Site.

Based on the available soil and groundwater data, a Soil Remediation Plan (SRP) was prepared and submitted to the NMOCD in May 2006. The primary objective of the SRP was to excavate the highly affected soils and to isolate and control residual concentration of COCs, preventing the COCs from further affecting the groundwater. The plan called for the placement of an impermeable liner at the base of the excavation to mitigate migration. The SRP was approved by the NMOCD in June 2006. During October and November 2006, EarthCon collected additional confirmation soil samples in the open excavations and supervised over-excavation of the impacted area, installation of a liner, and backfilling activities. The soil remediation activities were documented in the *Soil Closure Report* dated March 2007. Groundwater investigation activities were also conducted at the Site. Details associated with these site investigation activities were presented in the *Site Investigation and Annual Report*, dated March 2007. These reports document attainment of the risk based NMOCD approved cleanup objectives for soils established for this Site. Additionally, these reports established the COCs in groundwater had been delineated. The reports were submitted to the NMOCD for final regulatory approval for closure of soil issues at this Site, and a request made for a "No Further Action Required for Soil Remediation" letter from the NMOCD.

The groundwater remediation goals, and the proposed remedial approach are discussed in a Groundwater Work Plan submitted to the NMOCD in December 2009. Monitored natural attenuation is the established remedial approach for this Site along with source reduction activities including PSH recovery and quarterly groundwater monitoring. Additional assessment activities occurred at the Site in June of 2011, with the installation of recovery wells RW-1 through RW-6. The wells were initially installed to define the

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

lateral extent of affected groundwater and subsequently converted to recovery wells to enhance product recovery efforts.

EnTech was retained by Plains in July 2012 to manage groundwater and product recovery activities at the Site. As part of the remediation effort, two (2) recovery wells (RW-7 and RW-8), were installed in 2013. Since 2013, quarterly groundwater sampling and PSH recovery have been ongoing.

This report summarizes the activities conducted in 2023 for groundwater sampling, groundwater analysis, and PSH recovery activities.

1.3 Regulatory Framework

Based on standards outlined in New Mexico Administrative Code (NMAC), Title 20, Chapter 6, Part 2, the remediation criteria for groundwater at the Site are as follows:

COC	Limit (mg/L)
Benzene	0.01
Toluene	0.75
Ethylbenzene	0.75
Total Xylenes	0.62
Polynuclear Aromatic Hydrocarbons (PAH) (1,2)	0.03
Benzo-a-pyrene (2)	0.0007

1 –PAHs: Total naphthalenes plus monomethylnaphthalenes
2 –PAH remediation standards will be used as target concentrations only upon PSH removal.
mg/L – milligrams per liter

In addition to using the above values as the target cleanup goals for COC concentrations in groundwater at the Site, PSH removal is considered an integral part of ongoing remediation activities.

1.4 Limitations

EnTech has prepared this report using the level of care and professionalism in the industry for similar projects under similar conditions. EnTech will not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time this report was prepared. EnTech believes the conclusions stated herein are factual, but no guarantee is made or implied.

2.0 GROUNDWATER ASSESSMENT AND RESULTS

2.1 Groundwater Sampling Methodology

Activities conducted at the Site in 2023 primarily consisted of gauging wells for groundwater levels, determining the presence or absence of PSH, and recovering PSH using absorbent socks, hand bailing, and submersible pumps. Groundwater sampling of PSH-free monitor/recovery wells was also completed on a quarterly basis to evaluate the extent of the dissolved-phase hydrocarbon plume.

Measurements of the depth to groundwater and product thickness in wells with hydrocarbon sheen or PSH were completed during the PSH recovery and groundwater sampling events. Seven (7) groundwater monitor wells (MW-1 through MW-7) and eight (8) recovery wells (RW-1 through RW-8) were gauged using an oil/water interface probe. The well locations are shown on **Figure 2**. Recovery well RW-8 was installed in November 2013 to enhance product recovery efforts at the Site. Information regarding the installation of RW-8 was included in the *2013 Soil Investigation and Groundwater Monitoring* report submitted to the NMOCD in March 2014.

Groundwater level elevations and the presence of PSH, if any, were noted for each monitor/recovery well on a quarterly basis. In cases where no measurable PSH was detected by the interface probe, the downhole sensor of the probe was examined for the presence of PSH upon removal from the well. Four (4) recovery wells (RW-1, RW-2, RW-3, and RW-8) contained PSH thicknesses ranging from 0.01-foot (ft.) to 0.55-ft. during 2023. Starting in the second quarter of 2008 all recovery and monitor wells with PSH or sheen were required to be sampled annually. Additionally, after a review of the 2010 Annual Groundwater Monitoring Report (AGWMR), the NMOCD requested any monitor well which had a COC exceeding NMOCD standards be sampled for polycyclic aromatic hydrocarbons (PAH). To meet these two (2) requirements and for consistency, groundwater samples collected from recovery wells RW-1 through RW-3 and RW-8 were evaluated annually for benzene, toluene, ethylbenzene, and total xylenes (BTEX) and PAH constituents from 2008 through 2021.

Groundwater monitor wells not exhibiting PSH, or hydrocarbon sheen were gauged and sampled quarterly. After collecting and recording the groundwater level, each well was purged with a clean electric submersible pump or hand bailed using a clean disposable bailer, and groundwater samples were collected using a new dedicated disposable bailer.

Groundwater samples were transferred directly from the disposable bailers into the appropriate laboratory-supplied sample containers. The sample containers were then packaged to prevent breakage, placed on ice in a cooler, and shipped to Pace Analytical (Pace) in Mount Juliet, Tennessee for analysis. The groundwater samples were analyzed

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

for BTEX by Environmental Protection Agency (EPA) Method SW 8260B and PAHs by EPA Method SW 8270C.

2.2 Groundwater Gauging

Table 1 summarizes groundwater gauging (elevation and PSH thickness) measurements collected before each quarterly sampling event in 2021-2023. Historical groundwater elevation and PSH thickness measurements recorded since March 6, 2018, are presented in **Table 2**. The groundwater elevation calculations are based on the top of polyvinyl chloride (PVC) well casing elevations, which were last surveyed on March 15, 2005, by EarthCon, and updated in December 2013 by EnTech for the two (2) new recovery wells installed in November 2013 (RW-7 and RW-8).

2.3 Groundwater Gradient and Flow Direction

Using the 2023 groundwater gauging data summarized in **Table 1**, groundwater gradient maps illustrating groundwater flow direction are included as **Figures 3A** through **3D**. The calculated groundwater gradient and estimated groundwater flow direction are based on the gauging data obtained on March 7, June 21, September 28, and December 7, 2023. The hydraulic gradient in 2023 ranged from 0.0024- to 0.0047-foot/feet (ft/ft), based on groundwater elevations measured between monitor wells MW-4 and MW-1. The groundwater flow direction has consistently been to the south.

2.4 Groundwater Analytical Results

Groundwater samples were collected on March 8, June 21, September 29, and December 8, 2023, from all wells which did not contain PSH (see **Table 3**). Sampled monitor/recovery wells were purged by removing a minimum of three (3) to five (5) well volumes of groundwater. In some instances, depending on groundwater conditions, wells were bailed dry three (3) times using a disposable bailer and allowed to recover to at least 80% of the initial volume before collecting samples. Groundwater samples were collected and transferred into laboratory-supplied sample containers. The sample containers were placed on ice in a cooler and shipped to Pace, in Mount Juliet, Tennessee for analysis. Groundwater samples collected from select monitor/recovery wells were analyzed for BTEX in all four (4) quarters of 2023.

Groundwater samples were collected from monitor/recovery wells MW-3, MW-6, RW-1, and RW-7 during the first quarter 2023 sampling event, whereas samples were collected from monitor/recovery wells MW-1 through MW-7 and RW-1 through RW-8 during the second quarter 2023 sampling event. Monitor/recovery wells MW-1 through MW-7, RW-1, and RW-3 through RW-7 were sampled during the third and fourth quarter 2023 sampling events.

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

Analytical results reported for the groundwater samples collected from wells MW-1 through MW-7 and RW-1 through RW-8, indicated nondetectable BTEX concentrations or concentrations below the NMOCD groundwater remediation criteria during 2023. The groundwater sample collected from recovery well RW-8 was also analyzed for PAH during the second quarter 2023 sampling event. Analysis of the sample collected from RW-8 reported a total methylnaphthalene concentration of 0.13193 milligrams per liter (mg/L) as the only COC with a concentration above the NMOCD remediation criteria of 0.03 mg/L.

Table 2.4.1 below summarizes the benzene concentrations analyzed in groundwater samples collected in 2023 in which NMOCD Remediation Criteria exceedances or detectable concentrations were observed. The 2021-2023 analytical results are presented in **Table 3**.

TABLE 2.4.1

2023 BENZENE CONCENTRATIONS (mg/L)

	FIRST QUARTER	**SECOND QUARTER**	**THIRD QUARTER**	**FOURTH QUARTER**
	BENZENE	**BENZENE**	**BENZENE**	**BENZENE**
NMOCD REMEDIATION CRITERIA (MG/L)	**0.01**	**0.01**	**0.01**	**0.01**
RW-1	0.000485 J	0.000542 J	<0.000493	0.000867 J
RW-2	NS	0.00082 J	NS	NS
RW-3	NS	0.00654	0.000906 J	0.00101
RW-8	NS	0.000571 J	NS	NS

Note: Concentrations in bold indicate exceedances of NMOCD Remediation criteria.
NS –Not sampled due to a visible PSH sheen.
mg/L – milligrams per liter

Historical groundwater analytical results are presented in **Table 4**, with PAH results summarized separately on **Table 5**. Laboratory analytical reports and data packages are provided in **Appendix A**. The groundwater analytical data for each quarterly sampling event of 2023 are illustrated in **Figures 4A** through **4D**.

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

2.5 Groundwater Waste Disposal

Purge water recovered from monitor wells MW-1 through MW-7 and recovery wells RW-1 through RW-8 during quarterly gauging and sampling events were placed in the 1,100-gallon aboveground storage tank (AST) located at the Site. These liquids are vacuumed from the AST and transported off-Site for disposal by Gandy Corporation of Lovington, New Mexico. No off-Site disposal of recovered fluids occurred in 2023.

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

3.0 PSH RECOVERY

3.1 PSH Recovery Methodology

In addition to collecting groundwater samples, EnTech performed activities at the Site to periodically gauge and recover PSH from recovery wells exhibiting measurable thicknesses of PSH or a sheen (RW-1 through RW-3, and RW-8). Recovery well RW-8, was installed in November 2013 and added for PSH recovery on a weekly basis. Measurements to PSH and water levels were recorded during each Site visit (**Table 2)**. Initially, PSH recovery activities were completed using submersible pumps, hand bailing, and/or absorbent socks. Current PSH recovery activities typically consist of hand bailing five (5) - to 20-gallons of groundwater and dissolved-phase hydrocarbons and PSH.

3.2 PSH Recovery via Pumping and Manual Bailing

During 2023, measurable PSH was observed in recovery wells RW-1 through RW-3 and RW-8 during at least one (1) quarterly sampling event. Annual PSH and dissolved phase groundwater recovery data for 2023 are illustrated in **Table 6**.

The PSH thicknesses observed in recovery well RW-1 during 2023 appear to be stable. The maximum PSH thickness observed in RW-1 was a 0.03-ft, an increase from 0.02-ft reported during the fourth quarter 2022 gauging event. The calculated average PSH thickness measured in RW-1 in 2023 was 0.0017-ft.

The maximum PSH thickness observed in recovery well RW-2 during 2023 was 0.17-ft (third quarter 2023 gauging event), which is less than the maximum observed in 2022 (0.45-ft). The calculated average product thickness measured in RW-2 in 2023 was 0.10-ft, which is less relative to the calculated average product thickness observed in 2022 (0.12-ft).

The PSH thicknesses observed in recovery well RW-3 in 2023 ranged from 0.01- to 0.29-ft. These levels were a slight increase as compared to the maximum thickness observed in 2021 (0.04-ft) and 2022 (0.06-ft). The calculated average thickness for 2023 was 0.014-ft, a slight increase from 0.13-ft observed in 2022.

PSH thicknesses ranging from 0.02- to 0.55-ft were reported in recovery well RW-8 in 2023. The average calculated thickness in 2023 of 0.21-ft was a decrease relative to the average calculated thickness reported in 2021 (0.29-ft) and an increase relative to 2022 (0.13-ft).

3.3 PSH Waste Disposal

Approximately 22-gallons of PSH and 413-gallons of affected groundwater were recovered from the wells containing PSH during 2023 (RW-1 through RW-3 and RW-8) and placed in the on-Site AST. These liquids are vacuumed from the tank and transported

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

off-Site for disposal by Gandy Corporation of Lovington, New Mexico. No off-Site disposal of recovered fluids occurred in 2023.

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

4.0 MONITORED NATURAL ATTENUATION

4.1 Regulatory Framework for Monitored Natural Attenuation

Monitored Natural Attenuation (MNA) is defined by the New Mexico Environmental Department in 20.5.13 New Mexico Administrative Code (NMAC) as "a methodology for remediation that relies upon a variety of naturally occurring chemical, physical and biological processes to achieve target concentrations in a manner that is equally as protective of public health, safety and welfare, and the environment as other methods and that is accompanied by a program of monitoring to document the process and results of the above mentioned processes."

As part of the MNA process several lines of evidence need to be evaluated including those listed below:

- **Primary Lines of Evidence (PLOE).** Relies on use of historical groundwater data that demonstrate a clear trend of stable or decreasing COC concentrations over time and with distance away from the source at appropriate monitoring or sampling points.
- **Secondary Lines of Evidence (SLOE).** Uses geochemical indicators to document certain geochemical signatures or "footprints" in the groundwater that demonstrate (indirectly) the type of natural attenuation process(es) occurring at the affected property and the destruction of COCs; or uses distance-based/time-based/biodegradation rate calculations to demonstrate attenuation.
- **Other Lines of Evidence (OLOE).** Most often consists of predictive modeling studies and other lab/field studies that demonstrate an understanding of the natural attenuation process(es) occurring at the affected property and their effectiveness in controlling Protective Concentration Level Exceedance (PCLE) zone migration and decreasing COC concentrations.

4.2 Plume Stability and Monitored Natural Attenuation

The Site is currently undergoing Plume Stability Analysis. While field measured groundwater quality parameters (i.e., oxygen-reduction potential, dissolved oxygen, etc.) are recorded during groundwater sample collection, insufficient data exists at this time to perform a reliable evaluation.

While plume stability using MNA cannot be fully evaluated at this time, PLOEs do exist and include:

- The benzene concentrations reported in the groundwater samples collected from the monitor and recovery wells down-gradient of the plume (MW-1, MW-5 through

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

MW-7, and RW-6) were reported at nondetectable concentrations or levels below the NMOCD criteria since 2011;

- Benzene concentrations reported in the groundwater samples collected from cross-gradient monitor wells (MW-2 and RW-5) have remained at nondetectable levels or concentrations below the NMOCD criteria since 2007. Recovery well RW-7 was installed in 2013 and analysis of groundwater samples since installation have all indicated COC concentrations below the NMOCD groundwater remediation criteria;
- Benzene concentrations analyzed in groundwater samples collected from recovery wells in proximity to the release area (RW-1 through RW-3) appear to be stable since 2019, whereas concentrations reported in the groundwater samples collected from RW-8 have reported stable benzene concentrations since December 2021; and,
- PSH thicknesses observed in recovery wells RW-1 through RW-3 and RW-8 during 2023 appear to be stable. Specifically, the thicknesses observed in RW-1 have decreased from a maximum of 0.08-ft reported during the April 2, 2019 gauging event relative to a maximum thickness of 0.03-ft reported during the July 27 and August 31, 2023, gauging events; the observed PSH thickness in RW-2 decreased from a maximum of 0.75-ft reported during the January 29, 2019 and August 3, 2021 gauging events relative to a maximum thickness of 0.17-ft reported during the September 28and November 1, 2023, gauging events; the observed thickness in RW-3 increased from a maximum of 0.28-ft during the March 28, 2019, gauging event relative to a maximum of 0.29-ft reported during the July 27, 2023, gauging event; and, the observed maximum thickness of 0.78-ft reported in RW-8 during the February 5, 2019, gauging event has decreased relative to a maximum of 0.55-ft reported during the December 7, 2023, gauging event.

The dissolved phase plume was evaluated in 2023 by analyzing groundwater samples collected from select PSH-free monitor and recovery wells. Groundwater samples were collected from monitor/recovery wells MW-3, MW-6, and RW-7 during the first quarter 2023 sampling event (March 8, 2023). Monitor/recovery wells MW-1 through MW-7 and RW-1 through RW-8 were sampled during the second quarter 2023 sampling event (June 21, 2023). Monitor/recovery wells MW-1 through MW-7 and RW-1 through RW-8 were sampled during the third and fourth quarter 2023 sampling events (September 29 and December 8, 2023). Laboratory analysis of groundwater samples collected in 2023 reported nondetectable BTEX concentrations or concentrations below the NMOCD acceptable levels.

Understanding plume stability is an important step in the remedial planning process for a Site. For instance, an increasing plume could potentially migrate to human or environmental receptors, whereas a stable or decreasing plume may not pose an

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

imminent threat to human health and the environment. An introduction to plume stability analysis and the basis for the plume evaluation at the Site was presented in the 2009 Annual report.

This analysis was conducted to understand the overall stability of the benzene plume from 2006 through 2023. This study included the development of benzene concentration isopleths maps from the average of the benzene concentrations reported in the four (4) quarterly groundwater sampling events for all the wells with no PSH (specifically monitor wells MW-1 through MW-7 and recovery wells RW-4 through RW-7). Since the wells with PSH were sampled during the second quarter groundwater sampling events from 2008 through 2023, the benzene concentrations reported during this sampling event were used in the plume evaluation.

A SLOE is provided by the Mann Kendall Trend Test (MKTT), which is a statistical method used to analyze data collected over time for consistently increasing or decreasing trends. It is a non-parametric test, which means it works for all distributions (i.e., the data does not have to meet the assumption of normality), but the data should have no serial correlation.

The test can be used to find trends for as few as four (4) samples. However, with only a few data points, the test has a high probability of not finding a trend when one would be present if more points were provided. The more data points available, the more likely the test is going to find a true trend. The minimum number of recommended measurements is therefore at least eight (8) to ten (10) (Reference: Prashanth Khambhammettu: ”Mann-Kendall Analysis for the Fort Ord Site”, HydroGeoLogic, Inc.-OU-1 2004 Annual Groundwater Monitoring Report-Former Fort Ord, California, 2005).

Concentrations of benzene analyzed in groundwater samples collected from the Site between June 3, 2011, and December 8, 2023, were evaluated using the MKTT. Only monitor wells with detectable concentrations of benzene in 2019-2023 were evaluated.

Monitor wells evaluated by MKTT for benzene included recovery well RW-1 through RW-3 and RW-8.

Benzene Evaluation		
Well ID	Confidence Factor	Trend
RW-1	>99.9%	Decreasing
RW-2	99.0%	Decreasing
RW-3	>99.9%	Decreasing
RW-8	>99.9%	Decreasing

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

A copy of the MKTT analysis is included in **Appendix C**.

The benzene concentration isopleth maps for 2015 through 2023 are presented in **Figures 5** through **13,** respectively. The analytical data collected for the Site used for the plume stability analysis indicates that the benzene plume identified at the Site has a decreasing trend in concentration, size, and mass.

5.0 FINDINGS

Findings and recommendations resulting from 2023 groundwater monitoring at the Site are summarized below.

- Groundwater flow in the uppermost groundwater-bearing unit is in a southerly direction with a gradient ranging from 0.0024- to 0.0047-ft/ft as measured between wells MW-4 and MW-1. The flow direction is consistent with previously reported events.
- Analytical results reported for the groundwater samples collected in 2023 from monitor/recovery wells MW-1 through MW-7, and RW-1 through RW-8, indicated nondetectable BTEX concentrations or concentrations below the NMOCD remediation criteria.
- Laboratory analysis of groundwater samples collected from recovery wells with observed PSH in 2022 (RW-1 through RW-3 and RW-8), indicated benzene concentrations ranging from nondetectable to 0.00654 mg/L. Analysis of all other constituents (i.e., toluene, ethylbenzene, and total xylenes) occurred at nondetectable concentrations or concentrations below the NMOCD criteria.
- PSH recovery from wells RW-1 through RW-3, and RW-8 continued during 2023. The estimated quantity of PSH recovered from wells exhibiting PSH during monthly PSH recovery efforts totaled approximately 22-gallons, with affected groundwater recovery totaling approximately 413-gallons.
- The PSH plume has remained in the historical source area, located in the vicinity of recovery wells RW-1 through RW-3 and RW-8, and does not appear to be migrating downgradient.

Based on PSH recovery data and laboratory analysis of groundwater samples collected during 2023 from monitor and recovery wells at the Site, EnTech recommends the following actions:

- PSH recovery from wells RW-1 through RW-3 and RW-8 should continue on a monthly basis.
- Groundwater monitoring should be conducted semi-annually on monitor wells MW-1, MW-2, MW-4, MW-6, MW-7, RW-5, and RW-6 per the NMOCD approval of January 12, 2022.
- Quarterly groundwater sampling of monitor wells MW-3, MW-5, and recovery wells RW-1, RW-2, RW-3, RW-7, and RW-8 should be performed if no measurable PSH is observed.
- Annual groundwater sampling should be performed on all wells at the Site.

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

- PAH samples should be discontinued in all wells with two (2) consecutive years of concentrations below the NMOCD criteria. Recovery well RW-8 will be sampled for PAHs in 2024.

Released to Imaging: 12/18/2024 3:48:18 PM

Received by OCD: 6/5/2024 1:53:21 PM

ANALYTICAL REPORT

March 15, 2023

Plains All American Pipeline

Sample Delivery Group:	L1594221
Samples Received:	03/11/2023
Project Number:	PAA12015
Description:	Vac to Jal 5

Report To: Bill Goldsby
21 Waterway Ave., Suite 300
The Woodlands, TX 77380

Entire Report Reviewed By:

Jason Romer
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chad A Upchurch
Project Manager

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jennifer Huckaba

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.

- [ ] 1 . If Chain-of-custody (COC) is not received: contact client and if necessary, fill out a COC and indicate that it was filled out by lab personnel. Note issues on this NCF.
- [ ] 2. If COC is incomplete, check applicable issues below and add details where appropiate:
- [ ] *Collection date/time missing or incorrect
- [ ] *Analyses or analytes: missing or Clarification needed
- [ ] *Samples listed on COC do not match samples recieved (missing, additional,etc.)
- [ ] *Sample IDs on COC do not match sample Labels
- [ ] *Required trip blanks were not received
- [ ] *Required signatures are missing
- [x] 3. Sample integrity issues: check applicable issues below and add details where appropriate:
- [ ] *Samples: Past holding time
- [ ] *Samples: Not Field Filtered
- [ ] *samples: Insufficent volume received
- [ ] *Samples: Cooler damaged or compromised
- [ ] *Samples: contain Chlorine or Sulfide
- [ ] *Samples: condition needs to be brought to lab personnel's attention (details below)
- [ ] *Containers: Broken or compromised
- [ ] *Containers: Incorrect
- [ ] *Custody Seals: missing or compromised on samples, trip blanks or coolers
- [ ] *Packing Material: Insufficient/Improper
- [ ] *Preservation: improper
- [ ] *Temperature:not witin acceptance criteria (typically 0-6C)
- [ ] *Temperature: Samples arrived frozen
- [x] *Vials received with improper headspace
- [ ] *Other:
- [ ] 4. If Samples not preserved properly and Sample Receiving adjusts pH, add details below:
- [ ] Sample ID:_____
- [ ] Preserved by:_____
- [ ] Date/Time:_____
- [ ] Initial and Final pH:_____
- [ ] Amount/type pres added:_____
- [ ] Lot # of Pres added:_____
- [ ] 5. Client contact: If Client is Contacted for any issue listed above, fill in details below:
- [ ] Client:
- [ ] PM Initials:
- [ ] Contacted per:
- [ ] Date/Time:

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Chad A Upchurch
Project Manager

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.

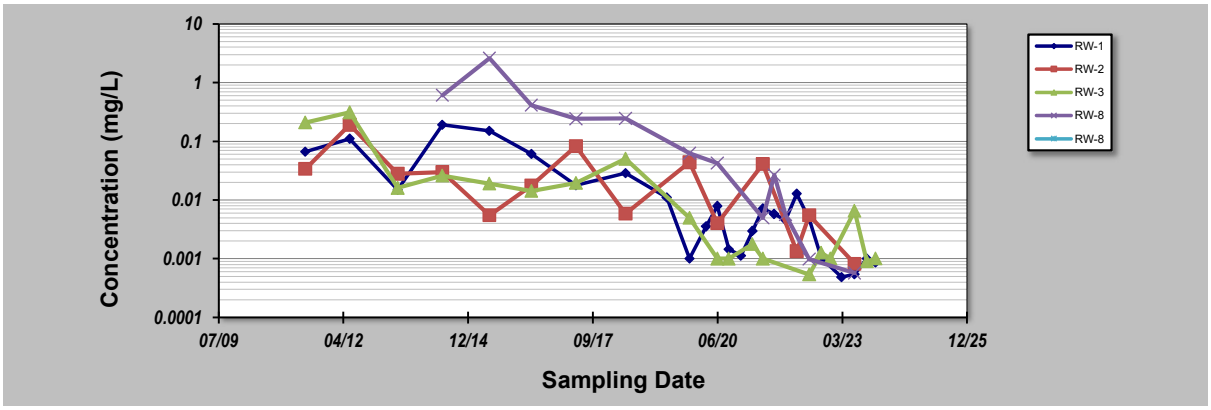
Coefficient of Variation:		1.78	1.43	2.26	2.07			
Mann-Kendall Statistic (S):		-170	-43	-97	-58			
Confidence Factor:		>99.9%	99.0%	>99.9%	>99.9%			
Concentration Trend:		Decreasing	Decreasing	Decreasing	Decreasing			



Notes:

1. At least four independent sampling events per well are required for calculating the trend. *Methodology is valid for 4 to 40 samples.*
2. Confidence in Trend = Confidence (in percent) that constituent concentration is increasing (S>0) or decreasing (S<0): >95% = Increasing or Decreasing; ≥ 90% = Probably Increasing or Probably Decreasing; < 90% and S>0 = No Trend; < 90%, S≤0, and COV ≥ 1 = No Trend; < 90% and COV < 1 = Stable.
3. Methodology based on "MAROS: A Decision Support System for Optimizing Monitoring Plans", J.J. Aziz, M. Ling, H.S. Rifai, C.J. Newell, and J.R. Gonzales, *Ground Water* , 41(3):355-367, 2003.
4. Nondetectable concentrations listed as 0.0009 mg/L (i.e., <MDL) and indicated in italicized bold red values.
5. All concentrations in milligrams per liter (mg/L)

michael.buchanan	Review of the 2023 Annual Groundwater Monitoring Report for Vacuum to Jal 14" Mainline #5: content satisfactory. 1. Plains has continued to remove LNAPL/PSH on a monthly basis from recovery wells: RW-1 through RW-3, RW-8 if present. 2. Approximately 22 gallons of PSH was removed from applicable wells and affected groundwater and transported off-site by Gandy Corporation as the hauler. 3. Please indicate which facility this is going to for disposal on the 2024 annual monitoring report, as there is not one listed in the report. 4. Continue to sample on a semi-annual basis for MW-1, MW-2, MW-4, MW-6, MW-7, RW-5, RW-6 5. Conduct quarterly sampling of monitoring wells MW-3, MW-5, and RW 1, RW-2, RW-3, and RW-8, if there is no measureable PSH. PAHs may be discontinued for sampling after 2 consecutive years--eight (8) quarters total for ND results or substantially below the WQCC human health standards. 6. Submit the 2024 annual report to OCD by June 4, 2024.	12/18/2024
