Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

EXECUTIVE SUMMARY

This report summarizes the successful reservoir testing activities performed on WDW-4 at the HR Sinclair Navajo Refining, LLC (HFSNR) facility in Artesia, New Mexico. The work was performed as a condition of the applicable UIC permit issued by the New Mexico Oil Conservation Division (OCD). Under contract, Petrotek Corporation (Petrotek) provided field supervision, completed pressure transient test analysis and prepared the final report documenting the fieldwork on the Class I non-hazardous injection well.

The test procedures were submitted to the OCD headquarters and OCD District II on June 11, 2024, before field activities commenced. Attachment 1 presents the test notification and procedures submitted to OCD. Approvals were received from regulatory agency staff prior to commencement of activities. Field activities were supervised by Adam Simonson (Petrotek).

The field activities consisted of an injection falloff test on WDW-4. Wellbore and reservoir properties were confirmed as similar to those determined from analysis of the previous testing conducted in the well and deemed adequate for continued injection operations.

Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

1. FACILITY INFORMATION

- a. **Name** - HollyFrontier Navajo Refining Company
- b. **Location** - Highway 82 East, Artesia, New Mexico, 88211
- c. **Operator's Oil And Gas Remittance Identifier (GRD) Number** - 15694

2. WELL INFORMATION

- a. **OCD UIC Permit number authorizing injection** - OCD UIC Permit: UICI-008-4
- b. **Well classification** - Class I Non-hazardous
- c. **Well name and number** - WDW-4
- d. **API Number** - 30-015-44677
- e. **Legal Location** - Section 23, Township 17S, Range 27E, 1217 FSL, 2443 FWL

3. CURRENT WELLBORE SCHEMATIC

A wellbore schematic displaying the well configuration during testing is provided as Figure 1. A current wellhead schematic is provided as Figure 2.

4. COPY OF AN ELECTRIC LOG ENCOMPASSING THE COMPLETED INTERVAL

A copy of the dual induction log run in 2018 during the completion of the well was submitted with the original permit and can be found online on the OCD website as part of the OCD well files for this well.

5. COPY OF RELEVANT PORTIONS OF ANY POROSITY LOG USED TO ESTIMATE FORMATION POROSITY

A copy of the neutron density log, encompassing the completed interval between 10,307 and 10,680 feet BGL, can be found online on the OCD website as part of the well files for this well. From these logs, it was determined that the injection reservoir thickness is approximately 330 feet with an average porosity of 25 percent. Consistent with the most recent test analysis previously submitted, these values were used for the analysis performed on data collected this year and presented in this report.

6. PVT DATA OF THE FORMATION AND INJECTION FLUID

Formation fluid samples of connate brine from the injection interval were not collected from the WDW-4 during drilling and completion. Therefore, the average total dissolved solids (TDS) of the formation fluid is estimated to be 25,000 mg/l per the previously submitted and approved UIC permit application based on data acquired from offset wells, and consistent with the initial falloff test analysis from 2018.

The formation viscosity, fluid compressibility, and total compressibility were estimated using this average brine salinity along with the bottom hole temperature and pressure recorded in the well at the depth of the injection zone in conjunction with industry standard correlations. These correlations are presented in the SPE textbook on Pressure Transient Testing which was published as part of the SPE Textbook Series as Volume 9. For the sake of brevity, only page, equation, and figure numbers from this volume are listed subsequently in this report as a reference for all correlations presented for the PVT data.

The percent solids for the fluid was approximated as 2.5%, based on the average 25,000 mg/l TDS brine concentration discussed above. A bottom hole temperature of 159 °F has been used as representative of the formation for these correlations. This value was derived from the original temperature log, run in 2018 when the well was completed. This log is can be found online on the OCD site as part of the WDW-4 well files.

Fluid viscosity was estimated using multiple equations developed by McCain that first are used to estimate fluid viscosity at atmospheric conditions (equations B-72, 73, and 74), which is then converted to viscosity at bottom hole conditions (equation B-75) by using a correction factor. These equations can be found on page 527. As a primary input for the correlation, pressure is required. The formation pressure has been estimated at a depth of 10,307 feet BGL using the average formation fluid specific gravity based on the TDS value discussed above. Using this method, a value of 4,574.5 psi has been estimated as the pressure at the depth the gauges were set at for testing (10,307 feet BGL). At this pressure and a temperature of 159 °F, the following equations have been used to derive viscosity:

$$\mu_{w1} = AT^B \quad (B-72)$$

$$A = 109.574 - 8.40564 * S + 0.313314 * S^2 + 8.72213 * 10^{-3} * S^3 \quad (B-73)$$

$$B = -1.12166 + 2.63951 * 10^{-2} * S - 6.79461 * 10^{-4} * S^2 - 5.47119 * 10^{-5} * S^3 + 1.55586 * 10^{-6} * S^4 \quad (B-74)$$

$$\frac{\mu_w}{\mu_{w1}} = 0.9994 + 4.0295 * 10^{-5} * P + 3.1062 * 10^{-9} * P^2 \quad (B-75)$$

Where,

μ_{w1} is the viscosity of the formation fluid at atmospheric conditions

T_F is the bottom hole temperature in °F

S is the percent of solids

P is the bottom hole pressure in psi

μ_w is the viscosity of the brine at bottom hole conditions

Using these equations, a value of 0.47 centipoise is calculated for the formation fluid viscosity.

Formation Compressibility was estimated using equation L-89 provided on page 337. This equation was developed for limestone formations, which is consistent with the primary composition of the effective injection interval (see discussion in Section 11).

$$cf = \frac{a}{(1+bc\Phi)^{\frac{1}{b}}} \quad (L-89)$$

Where,

a = 0.8535

b = 1.075

c = 2.303 E06

Φ = 0.25

Based on this equation, a value of 3.50E-6 psi⁻¹ is derived for formation compressibility.

Fluid compressibility was estimated using figures L-30 and L-31 on page 338 with a bottom hole temperature of 159 °F, a bottom hole pressure of 4,574.5 psi, and a dissolved solids weight of 2.5%. Using Figure L-31 to first estimate freshwater compressibility, a value of 2.86E-06 psi⁻¹ is derived. Using Figure L-30, the coefficient of isothermal compressibility (ratio of brine compressibility over freshwater compressibility) was determined to be approximately 0.95. This results in a value of 2.70E-06 psi⁻¹ for the formation fluid compressibility (c_w).

By combining the formation and formation fluid compressibility, the total system compressibility is determined. The total system compressibility (c_t) is approximately 6.20E-06 psi⁻¹.

The specific gravity of the test fluid, based on the static gradient survey performed at the end of the test, was 1.003 (gradient of 0.434 psi/ft) with a measured temperature during injection of 103.2 °F. Using Equations L-84 through L-87, the viscosity of the injected fluid at bottom hole conditions at the wellbore during injection is 0.76 cp. The compressibility of the injected fluid (based on Figures L-30 and 31) is 2.78E-06 psi⁻¹.

Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

The values presented in this section have been utilized for analysis unless stated otherwise.

7. DAILY RATE HISTORY FOR A MINIMUM OF ONE MONTH PRECEDING THE FALLOFF TEST

The following table summarizes recent data acquired with HFSNR well monitoring equipment for the month prior to and the month that testing was conducted.

TABLE 1
AUGUST AND SEPTEMBER INJECTION DATA

Date	Injection Pressure (psi)	Injection Rate (gpm)	Annulus Pressure (psi)
8/1/2024	334.68	268.73	334.72
8/2/2024	343.66	278.26	371.30

8. CUMULATIVE INJECTION INTO THE FORMATION FROM TEST WELL

At the time of shut-in for testing the cumulative volume of waste injected into this well since operations began, based on OCD records and HFSNR data, is 744,791,501 gallons (17,733,131 bbls).

9. PRESSURE GAUGES

- a. **Describe the type of downhole surface pressure readout gauge used included manufacturer and type** - Two downhole pressure and temperature memory gauges were utilized for the falloff testing. The gauges were 1.25-inch Quartz pressure and temperature memory gauges manufactured by DataCan (Part No. 101699).
- b. **List the full range, accuracy and resolution of the gauge(s)** - The memory gauges are designed to measure pressure to an accuracy of 0.03% of full scale and a resolution of 0.01% of full scale, and operate within a range of 14.7 to 20,000 psi.
- c. **Provide the manufacturer's recommended frequency of calibration and a calibration certificate showing the date the gauge was last calibrated** - These gauges are recommended to be calibrated once per year. These gauges were last calibrated on 5/27/2024. The most recent calibration certificates are provided in Attachment 3. The bottom gauge (Serial Number - DC224831) was utilized for analysis and hung at a test depth of 10,327 feet KB. The data for both gauges run during testing yielded consistent data and indicate that representative data was collected.

Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

10. ONE-MILE AREA OF REVIEW (AOR)

A standard one-mile Area of Review (AOR) was evaluated for WDW-4 as part of the annual testing and reporting requirements. This evaluation was performed by Federal Abstract Company. The wells located within this one-mile AOR are listed in Attachment 6. This table includes a listing of the operator, well name, API number, well type, well status, location, and date of abandonment or completion. A figure displaying the wells located in the AOR and the wells in the surrounding sections has been provided as Figure 11.

Based on the data review, no new wells have been drilled within the AOR in the last year. One well, listed in Table 2, has been newly plugged and abandoned within the AOR in the last year and does not penetrate the WDW-4 confining interval.

TABLE 2
WELLS P&A'd WITHIN AOR DURING THE PAST YEAR

Operator	Well Name	API	Well Type	TVD (ft)	Lat Long	P&A Date
Silverback Operating II, LLC	YESO VIKING FEDERAL #007	30-015-41425	Oil	4,525	32.8135 -104.2507	5/16/2024

- a. **Wells Located Within the One-mile AOR** - The wells located within the one-mile AOR are provided as Attachment 6. This table shows the operator, well name, API number, well type, well status, location, and date of abandonment or completion.
- b. **Status of Wells Within AOR** - In Attachment 6, the abbreviation SWD indicates Salt Water Disposal, P&A indicates Plugged and Abandoned, TA indicates Temporarily Abandoned, and AL indicates Abandoned Location. The "new" well status represents permitted wells that have not been drilled or completed.
- c. **Provide details on any offset producers and injectors completed in the same injection interval** - Based on public data, there is one well that has been completed in the same formation as WDW-4 within the one-mile AOR. As documented in previous submittals to OCD, this well is the Alamo Permian Resources, LLC Berry Federal #029, which was plugged and abandoned in 2013. No active offset producers or injectors exist in the injection interval within the AOR based on public data.

11. GEOLOGY

- a. **Describe the geologic environment of the injection interval**
- b. **Discuss the presence of geologic features, i.e., pinchouts, channels and faults, if applicable**
- c. **Provide a portion of a relevant structure map, if necessary**

The following discussion provides responses to the requirements listed above. This discussion is primarily based on information presented in the previous permit application for this well.

The WDW-4 well is located in Eddy County, New Mexico on the Northwest Shelf of the Permian Basin. The injection interval is undifferentiated Silurian-Devonian age strata composed of shallow water carbonates, dolostone and limestones. The confining zone is comprised of the upper Devonian Woodford Formation and the overlying undifferentiated Mississippian strata.

Based on the WDW-4 drilling report, the top of the Silurian-Devonian injection zone is at a depth of approximately 10,220 feet KB. A structure map of the top of the Silurian-Devonian is provided in Figure 3. The gross thickness of the Silurian-Devonian is approximately 665 feet thick. The top of the injection zone is over 1,000 feet below the base of the injection zone in which the three other Class I wells (WDW-1, WDW-2, and WDW-3) operated by HFSNR are completed. These three wells are completed in the lower portion of the Permian age Wolfcamp Formation and the underlying Pennsylvanian age Cisco and Canyon Formations. The geologic interpretations have been confirmed but not revised as part of this report.

12. OFFSET WELLS

There is one well that was completed in the same formation as WDW-4 within the AOR. As noted in 10.c, this well is the Alamo Permian Resources, LLC Berry Federal #029. This well was plugged and abandoned in 2013.

- a. **Identify the distance between the test well and any offset wells completed in the same injection interval** – The Berry Federal #029 well was located approximately 2,000 feet to the north of WDW-4.
- b. **Report the status of the offset wells during both the injection and shut-in portions of the test** - The offset Berry Federal #029 well was plugged and abandoned in 2013.
- c. **Describe the impact, if any, of the offset wells during both the injection and shut-in portions of the test** - There was no impact on the character of the falloff test or the development of a useful test from wells identified in the AOR. A discussion of possible late-time effects is included in Section 15 of this report.

13. CHRONOLOGICAL LISTING OF THE DAILY TESTING ACTIVITIES

- a. **Date of the test** - Testing was performed from September 10 - 12, 2024.
- b. **Time of the injection period** - Continuous injection occurred for approximately 48 hours before the falloff test began. This injection period exceeded the

duration of the falloff. Figures 4 and 5 present the short term and extended test history, respectively.

- c. **Type of injection fluid** - Filtered waste was utilized as test injection fluid.
- d. **Final injection pressure and temperature prior to shutting in the well** - Prior to shutting in the well, the bottom hole injection pressure was 4,756.0 psia (at 10,307 feet BGL) and the final injection rate was 231.8 gpm (7,948.8 bwpd) with a measured bottom hole temperature of 109.1 °F.
- e. **Total shut-in time** - The well was shut-in for approximately 45.4 hours for testing.
- f. **Final static pressure and temperature at the end of the falloff portion of the test** - At the conclusion of the test, the final bottom hole pressure was 4,723.3 psia and the final bottom hole temperature was 122.8 °F.

14. DESCRIBE THE LOCATION OF THE SHUT-IN VALVE USED TO CEASE FLOW TO THE WELL FOR THE SHUT-IN PORTION OF THE TEST

The well was shut-in using a wing valve located on the inlet side of the wellhead.

15. PRESSURE FALLOFF ANALYSIS

This section addresses requirements 15-20 of Section IX, Report Components, of the OCD falloff test guidelines.

The equations, parameters and calculations utilized to derive these values are detailed further in the following discussion. Table 3 contains input values used to perform the specified calculations.

The raw digital data collected during the test is provided in Attachment 7. The contracted service company whose gauges were utilized for testing generated an injection falloff test summary report based on this collected data. This report is provided in Attachment 4.

- a. **Radius of test investigation** - The radius of investigation for this test was determined to be 5,342 feet based on the average permeability derived from test analysis.
- b. **Time to beginning of the infinite acting portion of the test** - The time at which the test began to transition into final radial flow was approximately 4 hours after shut-in. This value was derived from the log-log plot.
- c. **Slope(s) determined from the semi-log plot** - The slope for the likely middle-time radial period, as determined from the semi-log plot, was 3.35136 psi/cycle.
- d. **Transmissibility (kh/μ)** - The transmissibility was determined to be 385,659 md-ft/cp.
- e. **Permeability (k)** - The permeability was determined to be 549 md.

Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

- f. **Skin Factor (s)** - The skin factor derived from the semi-log analysis was determined to be 1.2 units.
- g. **Pressure drop due to skin (ΔP_{skin})** - The pressure drop due to skin was determined to be 3.6 psi.
- h. **Flow efficiency** - The flow efficiency was determined to be 0.89.
- i. **Flow capacity (kh)** - The flow capacity (permeability-thickness) was determined to be 181,260 md-ft.
- j. **P_{1hr}** - The extrapolated 1-hr pressure was determined to be 4,730.4 psi.

TABLE 3
FALLOFF TEST ANALYSIS INPUT VALUES

Parameter	Value	Unit
Formation Thickness, h	330	feet
Porosity, Φ	25	percent
Viscosity, μ	0.47	centipoise
Formation Compressibility, c_f	3.50E-06	1/psi
Total Compressibility, c_t	6.20E-06	1/psi
Formation Volume Factor, B	1.00	bbl/stb
Wellbore Radius, r_w	0.3532	feet
Final Well Flowing Pressure, p_{wf}	4,755.98	psia
Final Injection Rate, q_{final}	7,948.8 231.8	bwpd (gpm)
Horner Straight Line Slope, m	3.35136	psi/cycle

The average historical injection period used to account for total volume in the analysis was calculated by dividing the cumulative historical injection through 8/1/2020 (4,573,230 barrels) by the final injection rate on 8/1/2020 (142.4 gpm). This resulted in a value of 22,475.7 hours. This value of 22,475.7 hours of injection at 142.4 gpm was used in conjunction with the injection data collected from 8/1/2020 through 9/10/24. The total waste volume injected up to the time of shut-in utilized for calculations was 744,791,501 gallons (17,733,131 bbls).

To determine the mobility-thickness (transmissibility), the following equation was utilized. The resulting transmissibility was 385,659 md-ft/cp.

$$\frac{kh}{\mu} = 162.6 \frac{q_{\text{final}} B}{m}$$

Where,

k is the permeability, in md
h is the formation thickness, in feet
 μ is the viscosity of the formation fluid, in cp
q is the final flow rate, in bpd

Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

B is the formation volume factor in RB/STB
m is the slope of the line assigned to the radial flow period on the semi-log plot, in psi/cycle
and 162.6 is a unit conversion constant

$$\frac{kh}{\mu} = \text{Transmissibility} = 162.6 \frac{7948.8 * 1.0}{3.35136} = 385,659 \frac{md - ft}{cp}$$

The transmissibility derived from the slope of the semi-log straight line was then used to determine the permeability thickness. The resulting permeability-thickness was 181,260 md-ft.

$$kh = \left(\frac{kh}{\mu} \right) \mu = 385,659 \left(\frac{md - ft}{cp} \right) 0.47 cp = 181,260 md - ft$$

This permeability-thickness was then used to determine the permeability of the reservoir. The resulting permeability was 549 md.

$$k = \frac{kh}{h} = \frac{181,260 md - ft}{330 ft} = 549 md$$

In order to determine if the appropriate viscosity was utilized in the previous calculations, it must be determined if the pressure transient was traveling through reservoir fluids. This is done by determining the time it is expected to take the pressure transient to travel through the injected fluid. The first step of this is to determine the radius of waste emplaced by injection. The piston-like displacement radius was estimated to be 620 feet.

$$r_{waste} = \sqrt{\frac{0.13368 * V}{\pi h \Phi}}$$

Where,

r_{waste} is the distance to the waste front, in feet
V is the total volume of fluid injected into the well, in gallons
h is the formation thickness, in feet
 Φ is the porosity, as a fraction
0.13368 is a conversion constant

$$r_{waste} = \sqrt{\frac{0.13368 * (744,791,501)}{\pi * 330 * 0.25}} = 620 feet$$

Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

Based on this radius, the time for a pressure transient to travel through this fluid can be calculated. The resulting time was approximately 0.48 hours.

$$t_{waste} = 948 \frac{\Phi \mu_{waste} c_t r_{waste}^2}{k}$$

Where,

t_{waste} is the time for a pressure transient to reach the waste front, in hours

Φ is the porosity, as a fraction

μ_{waste} is the viscosity of the waste, in cp

r_{waste} is the radius of the waste front, in feet

c_t is the total compressibility, in psi^{-1}

k is the permeability, in md

948 is a conversion constant

$$t_{waste} = 948 \frac{0.25 * 0.47 * 6.2E - 06 * (620)^2}{549} = 0.48 \text{ hours}$$

Based on this result, and the time it took for the transition to radial flow to begin (~4 hours), it is likely that the pressure transient was dominated by reservoir fluid properties during the subsequent middle-time radial flow period, indicating that the appropriate viscosity was used for the evaluation.

The near wellbore damage, referred to as skin, can be calculated based on the results of the straight line, semi-log analysis as well. This is done by utilizing the following equation. The result of this calculation was a skin of 1.2 units.

$$s = 1.151 \left(\frac{P_{wf} - P_{1hr}}{m} - \log \left(\frac{k}{\Phi \mu c_t r_w^2} \right) + 3.23 \right)$$

Where,

s is skin damage, in units

P_{wf} is the shut-in well pressure, in psi

P_{1hr} is the extrapolated pressure at a time of 1 hour, using the slope of the straight line from the semi-log analysis, in psi

m is the slope of the radial line, in psi/cycle

k is the permeability, in md

Φ is the porosity, as a fraction

μ is the viscosity, in cp

r_w is radius of the wellbore in feet

1.151 and 3.23 are constants

$$s = 1.151 \left(\frac{4,755.98 - 4,730.47}{3.35136} - \log \left(\frac{549}{0.25 * 0.47 * 6.2E - 06 * 0.3532^2} \right) + 3.23 \right) = 1.2$$

The pressure contribution of the skin term to wellbore pressure can be calculated using the following equation. The result of this calculation was 3.6 psi of pressure due to skin.

$$\Delta P_{skin} = 0.869 * m * s$$

Where,

ΔP_{skin} is the change in pressure due to skin, in psi
 m is slope of the radial line, in psi/cycle
 s is skin, in units
 0.869 is a conversion constant

$$\Delta P_{skin} = 0.869 * 3.35136 * 25.1 = 3.6 \text{ psi}$$

The flow efficiency (FE) can be determined using the following equation, provided within the OCD Guidelines (Section IX, 15, h). The result of this calculation was 0.89.

$$FE = \frac{P_{wf} - \Delta P_{skin} - P_{end \text{ of test}}}{P_{wf} - P_{end \text{ of test}}}$$

Where,

P_{wf} is the shut-in well pressure, in psi
 ΔP_{skin} is the change in pressure due to skin damage, in psi
 $P_{end \text{ of test}}$ is the pressure at the end of the falloff test, in psi

$$FE = \frac{4,755.98 - 3.6 - 4,723.27}{4755.98 - 4723.27} = 0.89$$

The test radius of investigation (r_{inv}) can be determined using the following equation. The result of this calculation was 5,342 feet.

$$r_{inv} = 0.029 \sqrt{\frac{kt}{\Phi \mu c_t}}$$

Where,

k is permeability, in md
 t is time, in hours
 Φ is porosity, as a fraction
 μ is viscosity, in cp
 c_t is total compressibility, in psi^{-1}

Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

0.029 is a constant

$$r_{inv} = 0.029 \sqrt{\frac{549 * 45.4}{0.25 * 0.47 * 6.2E - 06}} = 5,342 \text{ feet}$$

Based on examination of the log-log diagnostic plot provided as Figure 7, it is evident that early-time data is dominated by wellbore storage. It is likely that the test was transitioning into an initial radial flow period approximately 0.1 hours after shut-in. After approximately 0.5 hours, the derivative data increases and later stabilizes into a secondary radial flow period approximately 4.7 hours following shut-in (middle-time data suitable for semi-log analysis was selected between approximately 4.7 - 18.1 hours). The test has been analyzed using the analytical Horner semi-log method based on the reasonable assumption that a period of radial flow exists in the data. Figure 8 presents the semi-log plot of the falloff with a line consistent with the secondary radial flow period representing the outer reservoir conditions denoted in Figure 7. Figure 8a shows an analysis for the initial apparent radial flow period representative of the inner region nearest the well.

Simulation analysis indicated the potential presence of radial composite system with a composite radius of 665 feet and a mobility ratio (inner/outer zone) of 4.59. Outer zone permeability was estimated at 549 md, implying an inner zone permeability of approximately 2,520 md. The simulation analysis generally supports the more simplistic graphical analysis that relies upon the semi-log slope to derive a permeability-thickness during the most prominent middle-time period of the data more likely to be dominated by radial flow.

The character of the fall-off data and the derivative are similar to the patterns evident in previous testing of this well and are consistent with a large permeability-thickness and a small skin factor.

The following figures are provided illustrating the test analysis and results:

- Figure 4 - Cartesian Plot of Pressure, Temperature and Rate vs. Time
- Figure 5 - Full Rate History Plot
- Figure 6 - Cartesian Plot of Pressure Falloff with Model Match
- Figure 7 - Log-log Derivative Plot with Model Match
- Figure 8 - Semi-log Horner Plot with Model Match
- Figure 9 - Daily Injection Rate History for Month Prior to Test Plot
- Figure 10 - Hall Plot

As specified by OCD requirements, a Hall Plot (Figure 10) generated from the data presented in Table 1 over the month leading up to the falloff test this year is included. It is noted that this plot of a limited elapsed time of the Hall function is a

Annual Reservoir Testing
HF Sinclair Navajo Refining, LLC - Artesia, New Mexico – October 2024

simplistic presentation based on correcting average daily wellhead pressures to bottomhole conditions based on hydrostatic head and tubing friction loss. The plot has been made with these BHP values rather than a pressure change (or dp) that would be generated by subtracting original reservoir pressure from the injection pressure value. Because this BHP value is used, the Hall plot slope is not proportional to other indicators, but qualitatively can yield insight to well conditions based on changing slopes. Further, consistent with the Hall method, it is assumed that the reservoir is homogenous and isotropic, that none of the average daily pressures are impacted by transient flow (relatively continuous, constant rate injection took place), and that no offset wells are impacting pressure at this well during the time that the Hall function has been plotted. The slope of the data is fairly linear, and this linearity is consistent with no significant changes in well condition taking place during this time period. Based on this observed linear trend, there are no current concerns noted with regard to well or reservoir performance. Attachment 5 presents a summary of the falloff test.

Table 4 summarizes historical well test analysis results, including the results from the test this year.

TABLE 4
HISTORICAL AMBIENT RESERVOIR TESTING

Year	Fill Depth (feet)	Permeability (md)	Mobility-thickness (md-ft/cp)	Skin (units)	P* (psia)
2024	10,557	549*	385,659	1.2	4,711.2
2023	10,578	2,241	1,573,489	9.0	4,678.5
2022	10,662	3,018	2,118,788	38.5	4,613.5

13. Describe proposed or completed operations. (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work). SEE RULE 19.15.7.14 NMAC. For Multiple Completions: Attach wellbore diagram of proposed completion or recompletion.

August 4, 2024; Day 1: Begin constant-rate injection (+/- 10%) into WDW-4 as well as the three (3) offset wells for at least 30 hours prior to shut-in of WDW-4 for falloff testing. Target rate for WDW-4 is approximately 160 gpm. Wellhead pressure will not exceed 1,400 psig. Plant personnel will record rate, volume and pressure during the constant-rate injection period to ensure steady flow for analysis. Samples of the injectate will be collected approximately every 10 hours and analyzed for pH and specific gravity.

August 5, 2024; Day 2: Continue constant-rate injection into all four (4) wells.

August 6, 2024; Day 3: While injection continues, run dual downhole memory gauges to test depth making flowing gradient stops every 2,000 feet. Collect pressure data at test depth for at least 1 hour while injecting at constant rate. Shut in WDW-4 and collect falloff data for a minimum of 30 hours. As operationally feasible, WDW-1, WDW-2 and WDW-3 to continue injection at constant rate until downhole memory gauges are pulled from WDW-3.

August 7, 2024; Day 4: WDW-4 will remain shut-in while collecting falloff pressure data using downhole memory gauges.

August 8, 2024; Day 5: After a minimum of 30 hours of falloff data collection, remove gauges from the well making 5-minute gradient stops every 2,000 feet. Note the top of fill will be tagged either with gauges prior to pulling from the well, or on a second run with sinker bars after gauges are removed (TBD). Conduct MIT for a minimum of 30 minutes recording data electronically. Rig down wireline and return well to service.

 Company: Petrotek Corporation
 Well Name: Navajo Refining Waste Disposal Well No. 4
 Field Name: Davonia
 Location: Eddy, NM
 Formation: Artesia-Queen-Grayburg-San And
 Test Date: 09/16/2024 - 09/18/2024
 Gauge SN: DC-224831
 Gauge Range: 15000 psi
 FESCO File Ref: J202409161401001A-DC224831.xlsx
 =====

30-second gauge data

Action 392090

COMMENTS

Operator: HF Sinclair Navajo Refining LLC ATTN: GENERAL COUNSEL Dallas, TX 75201	OGRID: 15694
	Action Number: 392090
	Action Type: [C-103] Sub. General Sundry (C-103Z)

COMMENTS

Created By	Comment	Comment Date
cchavez	Based on the FOT Report, OCD deems the FOT to be acceptable for the following reasons: a. High injection rate into open borehole well construction with marginal pressure; b. High steady-state injection flow rate (~ 4% variation); c. FOT monitoring exhibited a pressure differential of only about 37 psi under rapid injection conditions in open borehole well construction; d. FOT minimal radial flow condition appeared to have been attained with transition to boundary effects in reservoir; e. FOT Plots adequately correlate with digital data; and f. Hall Plot indicates adequate permeability conditions persisted throughout the FOT.	5/19/2025

CONDITIONS

Action 392090

CONDITIONS

Operator: HF Sinclair Navajo Refining LLC ATTN: GENERAL COUNSEL Dallas, TX 75201	OGRID: 15694
	Action Number: 392090
	Action Type: [C-103] Sub. General Sundry (C-103Z)

CONDITIONS

Created By	Condition	Condition Date
cchavez	Conditions of Approval: 1) Well Pressure Plot shall include the entirety of the FOT from the start of injection to completion of the FOT; 2) To accommodate No. 1 above, the BHG needs to be installed and operational prior to running the FOT; 3) Future Horner Plot "Model Match" is not standard practice. Future Horner Plots shall conform to FOT standards, i.e., semi-log with proper "Ordinate and Abscissa" scales; 4) The flow rate plot shall be "to scale" and reflect actual rate during the period of the FOT to quickly discern key information from the plot; and 5) The operator shall determine the O&M schedule for the well, i.e., well cleaning, stimulation, etc. to ensure optimum operation. The FOT Log-Log Plot skin value of 22.5 contrasts with the Table 4 "Historical Ambient Reservoir Testing" (2024) skin value of "1.2" which seems more consistent with the operational efficiency of the well. However, if skin accuracy from the FOT is accurate, the well may be approaching O&M.	5/19/2025
