INTRODUCTION

XTO Energy Inc. (XTO) acquired the Bruington Gas Com #1 well site from Amoco Production Company (Amoco) in January 1998. This is a gas producing well in the Dakota Sandstone formation and is currently active. The Citizen's Irrigation Ditch runs adjacent to the location and is active in the summer months, while dry in the winter months. A topographic map is presented as *Figure 1*.

HISTORY

Historical records indicate Amoco excavated and backfilled an earthen blow pit approximately 125 feet south of the wellhead in October 1993. The pit closure report indicates the limits of the excavation were approximately 40 feet by 75 feet and no more than 20 feet maximum depth (**Attachment 1**). In November, 1993 additional excavation work was conducted to include the previously excavated blow pit and a separate earthen separator pit (**Attachment 2**). Field notes state the excavation was 120 feet to 150 feet south-southwest of the wellhead. The second excavation was "L" shaped with the two longest sides estimated at 120 feet by 150 feet. A third pit was excavated in 1993 at the Site and a report is included as **Attachment 3**. Site diagrams of all three excavations show the majority of the excavated materials were southwest of the wellhead. Field notes documenting the excavations indicate groundwater was encountered and that additional soil and groundwater remediation were recommended prior to site closure.

An approved risk-based closure request (**Attachment 4**) exists in the New Mexico Oil Conservation Division (NMOCD) database for a fourth earthen production pit located east of the earthen pits previously excavated by Amoco. This pit was operated by the El Paso Field Services (EPFS). According to the pit closure form, the dimensions of the pit were 17 feet by 16 feet by 12 feet below ground surface. The closure request included a field pit site assessment with field notes recommending additional excavation and one borehole to establish vertical delineation of impacts. The report indicates elevated field screening measurements and heavy staining on the side walls and the floor of the excavation. Upon further review of the documentation, it is apparent that hydrocarbon impact was left in place on the surface of the excavation and possibly within the exposed sandstone benches during the excavation of the pit.

Amoco installed three groundwater monitoring wells (MW-1, MW-2, and MW-3) in April 1996. Completion Diagrams and Borehole Logs are presented as **Attachment 5**. These monitoring wells were sampled in June 1996 and monitoring wells MW-1 and MW-3 contained no benzene, toluene, ethylbenzene, and total xylenes (BTEX) concentrations in excess of New Mexico Water Quality Control Commission (NMWQCC) standards. Groundwater sampled from monitoring well MW-2

2013 XTO GROUNDWATER REPORT

contained benzene and total xylenes concentrations exceeding NMWQCC standards. At the time, it was determined groundwater monitoring well MW-2 would be sampled annually in accordance with the NMOCD approved Groundwater Management Plan. After monitoring groundwater in the three wells, it became apparent that groundwater elevations at the site were dramatically influenced by a seasonal fluctuation in the nearby irrigation ditch immediately to the west of the site.

XTO acquired the location and conducted a site assessment in May of 1998. Monitoring wells MW-1 and MW-2 were damaged and no longer functional. Both monitoring wells were replaced in June 1998. Completion Diagrams and Borehole Logs for the monitoring wells installed during 1998 are presented in **Attachment 5**.

An annual groundwater report for 1996 through 1998 was submitted to the NMOCD in February of 1999 proposing further evaluation of monitoring well MW-2R and annual sampling of monitoring wells MW-1R and MW-3. NMOCD responded in April of 1999 requiring the extent of downgradient and lateral BTEX contamination in groundwater be further defined. Annual sampling continued throughout 1999 and 2000.

XTO installed monitoring wells MW-4, MW-5, and MW-6 in February 2001 in an effort to further delineate the extent of impacted groundwater. Completion Diagrams and Borehole Logs for the monitoring wells installed during 2001 are presented in **Attachment 5**. All six monitoring wells were sampled twice in 2001 with the exception of monitoring well MW-4; it was sampled only once. Laboratory analytical results indicated elevated concentrations of BTEX existed in groundwater sampled from monitoring wells MW-1, MW-2R, MW-5, and MW-6. Groundwater from monitoring wells MW-3 and MW-4 did not contain detectable concentrations of BTEX or BTEX concentrations were below NMWQCC standards.

An additional monitoring well was installed (MW-7) and monitoring well MW-3 was repaired (MW-3R) in 2003. Completion Diagrams and Borehole Logs for the monitoring well installed during 2003 are presented in **Attachment 5**. All monitoring wells continued to be sampled and, with the exception of monitoring wells MW-1R, MW-3R, and MW-4, groundwater consistently contained elevated concentrations of BTEX.

In 2005, XTO initiated further investigation of subsurface conditions by digging test holes and trenches to evaluate whether historically impacted soils were fully removed and if impacted soil was contributing hydrocarbons to the groundwater. Limited field studies concluded the vadose zone was impacted at depths greater than 15 feet (**Attachment 6**). This was consistent with the most concentrated area of groundwater impact around monitoring wells MW-2R, MW-5, MW-6, and MW-7.

The 2005 annual groundwater report was submitted to the NMOCD in January 2006 proposing possible additional excavation and consideration of an in-situ remediation system. XTO evaluated remediation options, but determined additional investigation was required to efficiently address soil and groundwater impacts. The 2006 annual groundwater report was submitted to the NMOCD in February 2007 proposing to measure groundwater elevations during months when the adjacent irrigation ditch was dry to confirm groundwater gradients and better understand the influence of the irrigation ditch within the project area. Additionally, XTO continued to evaluate appropriate remediation technologies and other potential sources for groundwater impact. Monitoring well MW-8 was installed in May of 2007 adjacent to the former pit operated and closed by EPFS. The Completion Diagram and Borehole Log is presented in **Attachment 5** and revealed impacted soil exists from 12 feet to 25 feet below ground surface. The NMOCD approved risk-based closure

2013 XTO GROUNDWATER REPORT

request in 1994 was based on bedrock encountered at 22 feet below ground surface and no apparent groundwater. The presence of impacted soil and impacted groundwater at MW-8 and the seasonal groundwater gradients indicate the former pit may be a source of groundwater impact at this site.

The 2007 annual groundwater report was submitted to the NMOCD in February of 2008 proposing continued investigation including measuring dissolved oxygen and water levels and requesting NMOCD encourage EPFS to conduct an evaluation of groundwater associated with the risk-based closure of the production pit.

In April 2009, XTO proposed installation of two 4-inch recovery wells, two additional monitoring wells, the addition of chemical oxygenate, and quarterly monitoring of groundwater at the site. In October of 2009, XTO instead conducted a Geoprobe® subsurface investigation to further delineate the extent of hydrocarbon impacted soil. The investigation report is included in **Attachment 7**. Based on the results of the subsurface investigation, XTO conducted quarterly groundwater monitoring at the site through 2010.

In January of 2011, XTO used a hollow stem auger to drill deeper boreholes and install a new groundwater monitoring well (MW-9) on the northern boundary of the well pad. **Attachment 7** contains the report detailing the hollow stem auger investigation and **Attachment 5** contains the completion diagrams and borehole logs for the soil borings and groundwater monitoring well MW-9.

On October 5, 2011, XTO met with the NMOCD to discuss site conditions and potential cost sharing options with EPFS. No response or comments were received from NMOCD. In the 2011 and 2012 annual groundwater reports submitted to the NMOCD, XTO proposed annual groundwater sampling and semi-annual water level measurements.

Summaries of groundwater elevation data and laboratory analytical results from historical and current groundwater monitoring are presented in **Table 1** and **Table 2** respectively.

METHODOLOGY

Groundwater elevations were measured in June and December 2013 from all groundwater monitoring wells and groundwater samples were collected in December 2013 from all groundwater monitoring wells.

Water Level Measurements

Static groundwater level monitoring included recording depth to groundwater measurements with a Keck oil/water interface probe. The interface probe was decontaminated with Alconox™ soap and rinsed with de-ionized water prior to each measurement.

Groundwater Sampling

Prior to sampling groundwater, depth to groundwater and total depth of wells were measured with a Keck oil/water interface probe. Presence of any free-phase petroleum hydrocarbons was also investigated using the interface probe. The interface probe was decontaminated with Alconox™ soap and rinsed with de-ionized water prior to each measurement. The volume of water in the wells was calculated, and a minimum of three casing volumes of water was purged from each well using a new disposable polyvinyl chloride (PVC) bailer or a dedicated PVC bailer or the well was purged dry. All purge water was disposed of into tanks on site.

2013 XTO GROUNDWATER REPORT

Once each monitoring well was properly purged, groundwater samples were collected by filling at least two 40-milliliter (ml) glass vials. The laboratory supplied vials were filled and capped with no air inside to prevent degradation of the sample. Samples were labeled with the date and time of collection, well designation, project name, collector's name and parameters to be analyzed. They were immediately sealed, packed on ice, and shipped to Environmental Science Corporation (ESC) in Mt. Juliet, Tennessee via Fed-Ex overnight delivery. Proper chain-of-custody (COC) procedures were followed with logs documenting the date and time sampled, sample number, type of sample, sampler's name, preservative used (if any), analyses required and sampler's signature. Laboratory reports from December 2013 is included as **Attachment 8** and 2013 field notes are included as **Attachment 9**.

Groundwater Contour Maps

Groundwater elevations measured in monitoring wells during site visits were used to draft groundwater potentiometric surface maps. Contours were inferred based on groundwater elevations and observation of physical characteristics at the site (topography, proximity to irrigation ditches, etc.).

RESULTS

Laboratory results from December 2013 indicate BTEX concentrations are below NMWQCC standards or not detectable in groundwater from monitoring wells MW-1R, MW-3R, MW-4, and MW-9. Laboratory results from groundwater in monitoring wells MW-2R, MW-5, MW-6, MW-7, and MW-8 indicate elevated concentrations of BTEX exist. BTEX concentrations in monitoring wells MW-2R, MW-5, MW-6, MW-7, and MW-8 remained stable in 2013, showing little decline. Upgradient groundwater monitoring well MW-9 contained benzene for the first time in December 2013.

Site monitoring activities indicate groundwater flow is primarily controlled by the adjacent unlined irrigation ditch. When the ditch is dry during the winter months, the groundwater flow direction near the center and eastern portion of the site is towards a small depression in the water table near monitoring well MW-5. Groundwater directly adjacent to the ditch trends steeply towards the ditch. Historical data indicates during the spring and summer months, when flow within the irrigation ditch is high, the small depression appears to be absent and groundwater at the site is essentially level, but flows away from the ditch to the east. **Figures 2 and 3** illustrate the estimated groundwater potentiometric surface during 2013.

CONCLUSIONS

The groundwater analytical results indicate that source material is still in contact with groundwater, causing the elevated concentrations of BTEX. Soil at the site has been impacted by historical releases of petroleum hydrocarbons from three known sources (former Amoco blowdown pit, former Amoco separator pit, and former EPFS production pit). The petroleum hydrocarbon impact attributable to these multiple sources is commingled in subsurface soil and groundwater at the site and can be loosely characterized by a western source area (the former Amoco blowdown pit and former Amoco separator pit) and an eastern source area (the former EPFS production pit).

Groundwater has been impacted by BTEX concentrations in excess of the NMWQCC groundwater standards in monitoring wells MW-2R, MW-5, MW-6, MW-7, and MW-8; BTEX in groundwater in monitoring wells MW-1R, MW-3R, MW-4, and MW-9 remain below the NMWQCC standards. BTEX concentrations in MW-7 remain consistently less than adjacent MW-8 and MW-6, indicating there are likely two separate groundwater plumes that have commingled. BTEX impact in groundwater is defined to the north, south, and west; yet remains undefined to the east. For the first time, BTEX concentrations were detected in upgradient monitoring well MW-9.

2013 XTO GROUNDWATER REPORT

Groundwater flow direction and elevation fluctuation at the Site appear to be in response to the presence of water in the nearby irrigation ditch. This influence is reduced farther away from the ditch. When water is present in the ditch, groundwater flow is east/northeast away from the ditch; this trend reverses during the drying cycle when water flow ceases in the ditch and groundwater flow gradually returns to the west/southwest toward the ditch.

RECOMMENDATIONS

XTO proposes to continue collection of depth to groundwater data semi-annually and collection of groundwater samples annually during 2014.

FIELD REPORT CLOSURE VERIFICATION

92140

1 31

LOCATION: LEASE BRUINGTON GAS WELL #1 SE 5W/4 NW/4 (E)
SEC 14 TWP 29N RNG 11W BM NMI ENTR SJ ST BM PIT BLOW

ATE STARTED 10-20-93
ATE FINISHED 10-27-93

CONTRACTOR: PAUL UELASQUEZ
EQUIPMENT USED: EXCAVATOR

ENVIRONMENTAL
SPEC. NO: REC

SITE FENCE/TENT: QUANTITY EXCAVATION APPROX. 40' X 75' X 20' MAX DEEP.

DISPOSAL FACILITY: CROUCH MESA

LAND USE: RESIDENTIAL/INDUSTRIAL

SURFACE CONDITIONS: EXCAVATED PRIOR TO ARRIVAL

FIELD NOTES & REMARKS: PIT LOCATED APPROXIMATELY 125 FEET SOUTH FROM WELL-HEAD.
EXCAVATION IS 20' DEEP. TOP 8-10' APPEARS UNCONTAMINATED. HEAVY 8'-10' DOWN,
HEAVY CONTAMINATION EVIDENCED BY DARK GRAY TO BLACK, WITH HEAVY PETROLEUM ODOR.
SOIL IS SILTY SAND, BOTTOM @ 18-20' IS SANDSTONE BEDROCK. WATER SLOWLY
SEEPING IN TO EXCAVATION.

IRRIGATION CANAL ~ 100' DOWNGRADIENT TO THE SOUTHWEST.

EXCAVATIONS CONTINUING ON WEST END OF PIT AT THIS TIME.

10/21/93 LEDGE ROCK ON SOUTH EDGE OF EXCAVATING @ ~ 12' DEEP. COARSE SANDY SOIL.

FIELD API CALIBRATION

SAMPLE NO:	WEIGHT (g)	API FREQUENCY (ml/READINGS)	DEPTH TO HYDROCARBON

SITE DETAILS

Legals - Twn: 29 Rng: 11
NMOCD Hazard Ranking: 20
Operator: AMOCO PRODUCTION COMPANY

Sec: 14 Unit: E
Land Type: 4 - Fee

Pit Closure Date: 04/28/94

RATIONALE FOR RISK-BASED CLOSURE:

The above mentioned production pit was assessed and ranked according to the criteria in the New Mexico Conservation Division's Unlined Surface Impoundment Closure Guidelines.

The primary source, discharge to the pit, has been removed. There has been no discharge to the production pit for at least five years and the pit has been closed for at least three years.

The production pit has been remediated to the practical extent of the trackhoe or to the top of bedrock. Initial laboratory analysis has indicated that the soil remaining at the bottom of the excavation is above standards based on the hazard ranking score. Contaminated soil was removed and transported to an approved landfarm for disposal. The initial excavation was backfilled with clean soil and graded in a manner to divert precipitation away from the excavated area. Any rainfall that does infiltrate the ground surface must migrate through clean backfill before reaching any residual hydrocarbons remaining in the soil. Therefore, further mobility of residual hydrocarbons is unlikely.

Since the soil samples from the initial excavation were above standards, a test boring was drilled and a sample was collected to evaluate the vertical extent of impact to soils. Test boring sample results indicated soils below standards beneath the original excavation.

El Paso Field Services Company (EPFS) requests closure of the above mentioned production pit location for the following reasons:

- Discharge to the pit has not occurred in over five years and the pit has been closed for over three years.
- The bulk of the impacted soil was removed during the initial excavation.
- The excavation was backfilled with clean soil and graded to divert precipitation away from the excavation area.
- All source material has been removed from the ground surface, eliminating potential direct contact with livestock and the general public.
- Groundwater was not encountered in the initial excavation or test boring; therefore, impact to groundwater is unlikely.
- Soil samples collected beneath the initial excavation were below standards.
- No potential receptors are within 1,000 feet of the site.
- Residual hydrocarbons remaining in the soil at the bottom of the initial excavation will naturally degrade in time with minimal risk to the environment.

Project Name/Number: PIT CLOSURE 24324

Attention: John Lambdin

On 05/03/94, Analytical Technologies, Inc., (ADHS License No. AZ0015), received a request to analyze **non-aqueous** samples. The samples were analyzed with EPA methodology or equivalent methods. The results of these analyses and the quality control data, which follow each set of analyses, are enclosed.

EPA Method 8015 analysis was added on 05/05/94 for sample 945008 per Stacy Sendler.

The matrix spike/spike duplicate data from the samples extracted on 05/05/94 is reported twice reflecting quantification using both the internal standard and external standard protocols. Both protocols were employed to quantify the samples submitted for this project.

If you have any questions or comments, please do not hesitate to contact us at (505) 344-3777.

Attention: John Lambdin

On 06/16/95, Analytical Technologies, Inc., (ADHS License No. AZ0015), received a request to analyze **non-aqueous** samples. The samples were analyzed with EPA methodology or equivalent methods. The results of these analyses and the quality control data, which follow each set of analyses, are enclosed.

If you have any questions or comments, please do not hesitate to contact us at (505) 344-3777.

EXECUTIVE SUMMARY

XTO Energy, Inc. (XTO) retained LT Environmental, Inc. (LTE) to conduct two subsurface soil investigations to define the vertical and lateral extent of petroleum hydrocarbon impacted soil and conduct groundwater monitoring activities to define the lateral extent of groundwater impacted by benzene, toluene, ethylbenzene, and total xylenes (BTEX) at the Bruington Gas Com #1 natural gas well site (Site). In addition to the soil and groundwater investigation activities, LTE reviewed four historical excavation reports, one each for the closure of a former Amoco unlined blowdown pit, a former Amoco unlined separator pit, an El Paso Field Services (EPFS) unlined production pit, and one excavation in between the former Amoco blowdown pit and the former Amoco separator pit. The excavation reports indicate impacted soil was left in place in the bottom and/or sides of the respective excavations. Groundwater monitoring wells were installed to address remaining impacts from the former Amoco pits, which is currently addressed by XTO.

A pit closure report for the former EPFS production pit was submitted to and approved by the New Mexico Oil Conservation Division (NMOCD) for risk-based closure siting presence of sandstone bedrock at 25 feet below ground surface (bgs) and no indication of groundwater above the sandstone. In May 2007, XTO installed a groundwater monitoring well adjacent to the former EPFS production pit and identified petroleum hydrocarbon impacted soil and groundwater above 25 feet bgs.

During the subsurface investigations covered by this report, LTE identified petroleum hydrocarbon impacted soil and groundwater across the Site. The concentrations of total petroleum hydrocarbons and BTEX in soil samples exceed NMOCD standards and concentrations of BTEX in five groundwater monitoring wells exceed the New Mexico Water Quality Control Commission groundwater standards. Lithology at the Site is characterized by a consolidated sand unit, which is most likely highly weathered Nacimiento Sandstone, overlain by a sandy clay to clay unit, in turn overlain by a silty sand unit. The petroleum hydrocarbon impact to soil resides primarily in the sandy clay unit with a lesser area of the underlying consolidated sand unit also being impacted by petroleum hydrocarbons. The upper silty sand is not impacted.

The petroleum hydrocarbon impact to soil and groundwater is most likely attributable to multiple sources and comingled in subsurface soil and groundwater at the Site. It can be characterized by a western source area (the former Amoco blowdown and separator pits) and an eastern source area (the former EPFS production pit).

1.0 INTRODUCTION

XTO Energy, Inc. (XTO) retained LT Environmental, Inc. (LTE) to conduct two subsurface soil investigations to define the vertical and lateral extent of petroleum hydrocarbon impacted soil and conduct groundwater monitoring activities to define the lateral extent of impacted groundwater at the Bruington Gas Com #1 well site (Site) due to historical operations. The subsurface investigation included installation of 25 Geoprobe® boreholes (B-1 through B-25) in October 2009, installation of 10 hollow stem auger boreholes (B-26 through B-35) in January 2011, and installation of one groundwater monitoring well (MW-9) in January 2011. Additionally, LTE collected soil samples for analysis of total petroleum hydrocarbons (TPH) and benzene, toluene, ethylbenzene, and total xylenes (BTEX), measured groundwater elevations in nine groundwater monitoring wells, and collected groundwater samples for analysis of BTEX.

2.0 SITE SETTING AND BACKGROUND

2.1 SITE DESCRIPTION

The Site is a natural gas well location and adjacent parcel of private property in the southwest quarter of the northwest quarter of Section 14, Township 29 North, and Range 11 West in San Juan County, New Mexico. Surface topography is a faint elongated depression gently sloped to the west toward the Citizens Irrigation Ditch, which is approximately 150 feet from the well location (Figure 1).

2.2 SITE GEOLOGY AND HYDROGEOLOGY

The Site is located in the northern San Juan Basin on the north slope of the San Juan River Valley and 0.5 miles east of Bloomfield Canyon (Figure 1). Asymmetrically layered Tertiary sandstones and shales of the Nacimiento Formation along with Quaternary alluvial deposits dominate surficial geology (Dane and Bachman, 1965). Miles of arroyos, washes, and intermittent streams exist as part of the drainage network toward the San Juan River. These features often cut into exposed surfaces of the Nacimiento Formation, contributing to sedimentation downstream. The sudden influx of water from storm events easily erodes soil that covers the area. Alluvial aquifers are prevalent in the valley fill of the San Juan River and its tributaries (Stone et al., 1983).

2.3 SITE HISTORY

The Site includes one natural gas well (Bruington Gas Com #1) and related production equipment. Amoco Production Company (Amoco) operated the well and related production equipment until December 7, 1997, at which time XTO (doing business as Cross Timbers Operating Company) began operations. Amoco operated a former unlined separator pit and a former unlined blowdown pit that were taken out of service and excavated in 1993. El Paso Field Services, LLC (EPFS) formerly operated a gas gathering system and utilized a former unlined production pit on site that was excavated in 1994. Copies of the excavation reports for the above-referenced pits are in Appendix A of this report.

2.3.1 Soil Impact

From October 20 to 27, 1993, Amoco excavated an area approximately 40 feet by 75 feet by 20 feet deep to remove petroleum hydrocarbon impacted soil adjacent to the decommissioned blowdown pit. The excavation was overseen by Envirotech, Inc. (Envirotech) of Farmington, New Mexico. The excavation report prepared by Envirotech (Appendix A) indicates the blowdown pit was located 125 feet south of the wellhead (Figure 2). Petroleum hydrocarbon impacted soil was not encountered in the excavation until 8 feet below ground surface (bgs) to 10 feet bgs, at which depth soil with dark grey to black staining and heavy petroleum odor was encountered. The impacted soil extended to the bottom of the excavation at 18 feet bgs to 20 feet bgs, at which depth sandstone bedrock was interpreted to be present. The headspace of soil samples collected from a depth of 15 feet bgs were field screened with an organic vapor meter (OVM) and contained 625 parts per million (ppm) to 736 ppm of organic vapors. One soil sample was collected from a depth of 17 feet bgs and analyzed by Envirotech Laboratories of Farmington, New Mexico (Envirotech Labs) for TPH. TPH concentrations were not detected in the soil sample above the laboratory detection limit of 10 milligrams per kilogram (mg/kg). Groundwater was encountered during the excavation at a depth of approximately 18 feet bgs and sampled for analysis of BTEX. The groundwater sample contained 3,320 micrograms per liter ($\mu\text{g/l}$) of benzene, 3,500 $\mu\text{g/l}$ of toluene, 87 $\mu\text{g/l}$ of ethylbenzene, and 2,458 $\mu\text{g/l}$ of total xylenes.

On October 22, 1993, Amoco excavated an area approximately 65 feet by 75 feet by 2 feet to 8 feet deep to remove petroleum hydrocarbon impacted soil adjacent to the former separator pit. The separator pit was removed from service and replaced by a closed loop separator. The excavation was overseen by Envirotech. The excavation report prepared by Envirotech (Appendix A) indicates the separator pit was located 160 feet west of the wellhead (Figure 2). The bottom of the excavation extended to a depth of 8 feet bgs in the north end of the excavation to 2 feet bgs in the south end of the excavation, at which depth sandstone bedrock was interpreted to be present. The headspace of soil samples from 4 feet bgs to 8 feet bgs were screened with an OVM and contained 555 ppm to 1,717 ppm of organic vapors. One soil sample was collected from a depth of 8 feet bgs and analyzed by Envirotech Labs for TPH. TPH concentrations were not detected above the detection limit of 10 mg/kg. Groundwater was not encountered during the excavation.

On November 10, 1993, Amoco excavated an area approximately 120 feet by 144 feet by 15 feet deep to remove petroleum hydrocarbon impacted soil located between the blowdown pit and separator pit excavations. The excavation was overseen by Envirotech. The excavation report prepared by Envirotech (Appendix A) indicates the center of the excavation was located 40 yards to 50 yards (120 feet to 150 feet) south 40 degrees ($^{\circ}$) west of the wellhead (Figure 2). The depth of the excavation was variable and extended to a maximum of 15 feet bgs, at which depth sandstone bedrock was interpreted to be present. The headspaces of two soil samples (9 feet bgs to 10 feet bgs) were screened with an OVM and contained 604 ppm and 677 ppm, respectively, of organic vapors. The soil samples were analyzed by Envirotech Labs for TPH and BTEX. The sample collected at 9 feet bgs contained 358 mg/kg of TPH, 0.061 mg/kg of benzene, 0.940 mg/kg of toluene, 0.890 mg/kg of ethylbenzene, and 6.53 mg/kg of total xylenes, and the sample collected at 10 feet bgs contained 310 mg/kg of TPH, 0.192 mg/kg of benzene, 2.18 mg/kg of toluene, 2.36 mg/kg of ethylbenzene, and 43.8 mg/kg of total xylenes. Groundwater was encountered during the excavation and sampled for analysis of BTEX; the depth was not noted.

The groundwater sample contained 5,500 µg/l of benzene, 4,380 µg/l of toluene, 438 µg/l of ethylbenzene, and 3,450 µg/l of total xylenes.

On April 28, 1994, a production pit owned by EPFS was removed and an unknown volume of petroleum impacted soil adjacent to the pit was excavated. The excavation report (Appendix A) is not on letterhead; therefore, it is not known what firm oversaw the excavation. The excavation report indicates there were two pits on site, however only one was closed. The EPFS production pit was located 144 feet south 120° east of the wellhead. The final excavation of the pit was approximately 17 feet by 16 feet by 12 feet deep (Figure 2), and the side walls and floor were ‘still real black’ as noted in the remarks section. One soil sample from 12 feet bgs was field screened with an OVM and contained 410 ppm of organic vapors. The soil sample was analyzed by Analytical Technologies, Inc. (ATI) for TPH and BTEX. The sample contained 433 mg/kg of TPH, 2.6 mg/kg of benzene, 59 mg/kg of toluene, 8.8 mg/kg of ethylbenzene, and 110 mg/kg of total xylenes. On June 13, 1995, Philip Environmental of Farmington, New Mexico completed one borehole to a depth of 25.5 feet bgs and submitted one soil sample from a depth of 25 feet bgs to 25.5 feet bgs to ATI for analysis of BTEX. BTEX was not detected in the sample above the laboratory detection limit of <0.025 mg/kg. The borehole log indicated black soil from approximately 15 feet bgs to 22 feet bgs. On July 2, 1998, New Mexico Oil Conservation Division (NMOCD) received the “Rationale for Risk-Based Closure” for the dehydration pit prepared by EPFS, which was approved by NMOCD on December 21, 1998.

In October 2009, LTE conducted a Geoprobe® investigation for XTO, and in January 2011, LTE conducted a supplementary soil boring investigation using a hollow stem auger with continuous core (Figure 2). Results of these two investigations are discussed in this report.

2.3.2 Groundwater Impact

In April 1996, Blagg Engineering, Inc. (Blagg) was retained by Amoco to install three groundwater monitoring wells (MW-1, MW-2, and MW-3) and monitor groundwater quality. To correct the submerged screen intervals in MW-1, MW-2, and MS-3, in June 1997, Blagg drilled MW-1A immediately adjacent to MW-1 and pulled the casings of MW-2 and MW-3 up 7.47 feet and 3.00 feet, respectively.

During the May 1998 site visit, Blagg observed the casing for monitoring well MW-1 was broken and MW-1A and MW-2 were dry. In June 1998, Blagg installed groundwater monitoring wells MW-1R and MW-2R to replace MW-1A and MW-2, respectively. In February 2001, Blagg installed groundwater monitoring wells MW-4, MW-5, and MW-6; and in July 2003, Blagg installed groundwater monitoring MW-7. MW-8 was installed by Lodestar Services, Inc. (Lodestar) in May 2007 and MW-9 was installed by LTE in January 2011.

Groundwater monitoring and sampling for BTEX has occurred at varying frequencies from quarterly to annually by Blagg, Lodestar, and LTE from April 2006 until present.

3.0 METHODS

This section provides a description of the methods that were employed to complete the LTE subsurface investigation. LTE notified New Mexico One-Call and had all underground utilities identified prior to initiating ground disturbing activities.

3.1 SOIL INVESTIGATION METHODS

LTE provided a geologist trained in conducting soil sampling and logging to oversee site investigation activities. The geologist described soil samples according to the Unified Soil Classification System and conducted field screening of organic vapors to determine which soil samples were to be submitted for laboratory analysis. Lithologic logs are presented in Appendix B.

Field screening for volatile aromatic hydrocarbons using a photoionization detector (PID) with a 10.6 electron-volt lamp was conducted on the soil sample collected from the interval immediately beneath the ground surface and every two feet thereafter in addition to any soil that was visibly stained or had a hydrocarbon odor. Field screening was conducted in accordance with the NMOCD's *Guidelines for Remediation of Leaks, Spills, and Releases*, dated August 13, 1993. Soil samples for laboratory analysis were collected from the section of core containing the highest field screening results and from the bottom of each soil boring.

To minimize loss of volatile aromatic hydrocarbons from the soil samples, the soil was firmly packed into glass soil jars supplied by the laboratory and immediately placed on ice in a cooler. The sample jars were labeled with the date and time of collection, sample identifier, project name, collector's name, and parameters to be analyzed. Strict chain-of-custody (COC) protocol was followed from sampling through shipment. The date and time sampled, sample identifier, sampler's name, required analyses, and sampler's signatures were included on the COC.

All down-hole equipment was thoroughly decontaminated on site prior to each use; decontamination water was containerized in a lined bin and collected into 55-gallon drums for disposal in an on-site below-grade tank. Impacted soil was containerized in 55-gallon drums, labeled for their contents, and disposed of at the Envirotech landfarm in Hilltop, New Mexico. Upon completion, all soil borings were filled to ground surface with grout.

3.1.1 Geoprobe® Soil Samples

October 27 and 28, 2009, LTE utilized a Geoprobe® 6620-DT track rig (Geoprobe®) to investigate the soil at 25 point locations (soil borings B-1 through B-25, Figure 2). Samples collected from these soil borings were shipped on ice via overnight courier to Hall Environmental Analytical Laboratories (HEAL) of Albuquerque, New Mexico for analysis of BTEX by United States Environmental Protection Agency (EPA) Method 8021B, and TPH by EPA Method 8015B.

3.1.2 Hollow Stem Auger Soil Samples

January 4 to 7, 2011, LTE utilized a CME-75 drilling rig equipped with hollow stem augers and a split spoon sampler to continuously core 10 soil borings (B-26 through B-35, Figure 2). Samples collected from these soil borings were shipped on ice via overnight courier to Environmental Science Corporation (ESC) Laboratories, Mt. Juliet, Tennessee for analysis of BTEX by EPA Method 8021B, and TPH-gasoline range organics (GRO) and TPH-diesel range organics (DRO) by EPA Method 8015B.

3.2 GROUNDWATER INVESTIGATION METHODS

3.2.1 Groundwater Monitoring Well Installation & Development

Soil boring B-34 was converted to a groundwater monitoring well (MW-9) with a total depth of 33 feet bgs. The well completion diagram for MW-9 is presented in Appendix B. The groundwater monitoring well was constructed of 2-inch diameter schedule 40 polyvinyl-chloride (PVC) and included 15 feet of 0.01 inch machine slotted flush-threaded PVC well screen. A clean 10-20 grade silica sand gravel pack was placed from the bottom of the soil boring to two feet above the top of the screen. Two feet of three-eighths inch bentonite chips were set above the gravel pack, followed by a neat cement slurry to the surface, containing a minimum of 5 percent powdered bentonite. On January 13, 2011, LTE gauged depth to groundwater in MW-9 and determined the well was dry.

On March 2, 2011, LTE measured the depth to groundwater in MW-9 and upon determining the well contained sufficient water, LTE developed MW-9 utilizing a clean, disposable PVC bailer to remove groundwater from the monitoring well. During well development, LTE monitored pH, electrical conductivity, and temperature until parameters stabilized and turbidity was reduced to the greatest extent possible. The monitoring well was allowed to recharge a minimum of 7 days prior to collection of groundwater samples.

3.2.2 Groundwater Sampling

Prior to sampling the groundwater monitor wells, depth to groundwater and total depth of each well was measured with a Keck® oil/water interface probe. No phase-separated hydrocarbons were measured in any of the groundwater monitoring wells. The interface probe was decontaminated with Alconox® soap and rinsed with de-ionized water prior to each measurement.

The volume of water in each groundwater monitoring well casing was calculated by subtracting the depth to groundwater from the total depth of the well and a minimum of three well casing volumes of water was purged from the well or the well was purged dry using a dedicated disposable polyethylene bailer. As water was purged from the groundwater monitoring well, pH, electric conductivity, and temperature were monitored until these parameters stabilized, indicating that the water was representative of aquifer conditions. Stabilization was defined as three consecutive stable readings for each water parameter (± 0.4 units for pH, ± 10 percent for electric conductivity, and $\pm 2^\circ$ Celsius for temperature). The field parameters were recorded on Sampling Purge Logs, which are provided in Appendix C. All purge water was disposed of into the on-site below-grade tank.

Once each groundwater monitoring well was purged, groundwater samples for BTEX analysis were collected by filling three 40-milliliter (ml) glass vials. The pre-cleaned, non-preserved vials were filled and capped with zero headspace to prevent loss of volatiles and immediately placed on ice in a cooler. The sample vials were labeled with the date and time of collection, sample identifier, project name, collector's name, preservative, and parameters to be analyzed. Strict COC protocol was followed from sampling through shipment. The date and time sampled, sample identifier, sampler's name, preservative used, required analyses, and sampler's signature was included on the COC.

On January 13, 2011, LTE measured depth to groundwater in nine groundwater monitoring wells (MW-1 through MW-9) and collected groundwater samples from all monitoring wells except MW-9, which was dry. Samples were shipped in a cooler on ice via overnight courier to ESC Laboratories in Mt. Juliet, Tennessee for analysis of BTEX by EPA Method 8021B.

On March 2, 2011, LTE measured depth to groundwater in all groundwater monitoring wells and utilized the data to calculate groundwater elevations and prepare a potentiometric surface map for the Site. LTE determined there was sufficient water to sample MW-9.

On March 10, 2011, LTE measured depth to groundwater and collected a groundwater sample from MW-9. Samples were shipped in a cooler on ice via overnight courier to ESC Laboratories in Mt. Juliet, Tennessee for analysis of BTEX by EPA Method 8021B.

4.0 RESULTS

4.1 SOIL

4.1.1 Lithology

The deepest lithologic unit encountered at the Site is a consolidated sand unit, which appears to have a variable topography, forming a large, elongated depression aligned northeast/southwest with steep sides on the north, east, and south (Figure 3). The consolidated sand unit was shallowest in soil boring B-29 (3.5 feet bgs) and deepest in soil boring B-12 (31.5 feet bgs); this unit occasionally contains lenses of silty sand or sandy silt. A smaller and shallower secondary depression in the consolidated sand unit is present in the eastern part of the Site, near the former unlined EPFS pit, separated from the primary axis of the depression by a small lithologic rise in the consolidated sand unit near monitoring well MW-7. To the south of the smaller depression, a plateau in the consolidated sand unit is interpreted to be present. The thickness of the consolidated sand unit is not known; that determination was beyond the scope of this investigation. This consolidated sand unit was interpreted as bedrock during the 1993 and 1994 excavations at the Site and is most likely a highly weathered Nacimiento sandstone. It was penetrated less than one foot deep by the Geoprobe® equipment during the October 2009 investigation, but additional penetration and sampling was possible utilizing the hollow stem auger and continuous core sampling during the January 2011 investigation. Samples collected from the continuous core indicate the sand is impacted in some areas.

The central portion of the depression in the consolidated sand has been filled with a sandy clay to clay unit, which is interbedded with unconsolidated well sorted sand and/or sandy silt along the

northern and southern flanks. The sandy clay to clay unit is encountered at depths varying from 10.25 feet bgs to 23 feet bgs. This unit ranges in thickness from 0.5 feet to 20.75 feet; it is thickest in the depressions and is pinched out where the consolidated sand unit rises in elevation.

A silty sand unit overlies the sandy clay, sandy silt, and unconsolidated sand units and is present to ground surface. The silty sand unit ranges in thickness from 0.5 feet to 20.75 feet. Cross sections through the Site have been prepared to depict the lithology and contaminant distribution in the soil (Figures 4, 5, 6, and 7).

4.1.2 Field Screening Results

Field screening results indicate organic vapors greater than 50 ppm as measured on the PID are first encountered in soil borings at a depth ranging from 10 feet bgs in B-6, B-13, and B-25 to 17 feet bgs in B-24; and extend to depths ranging from 12 feet bgs in B-13 to 28.5 feet bgs in B-32. The highest PID concentrations were encountered at a depth of 16 feet bgs to 17 feet bgs in B-19 (3,444 ppm), which is adjacent to and below the total depth of the former EPFS production pit excavation and at a depth of 17 feet bgs in B-24 (3,060 ppm), which is northwest of the former Amoco blowdown pit excavation. Soil less than 10 feet bgs does not contain any detectable organic vapors as measured by the PID except for B-6 (1,402 ppm at 10 feet bgs) and B-25 (250 ppm at 10 feet bgs); all field screening results are shown in the lithologic logs in Appendix B.

4.1.3 Soil Sampling Results

Soil sample analytical results exceed the NMOCD standards for TPH, benzene, and/or total BTEX in the area of the former Amoco blowdown pit, the former EPFS production pit, and the north end of the well location. Soil samples near the former Amoco separator pit do not exceed NMOCD standards. The soil sample from soil boring B-34, at the north end of the well location, exceeds the NMOCD standard for TPH, but associated staining was only a ¼-inch thick in the continuous core. This soil sample is likely unrelated to the former pits. Table 1 and Figure 8 summarize the soil sample laboratory analytical results and copies of the laboratory analytical reports are presented in Appendix D.

The NMOCD standard of 10 mg/kg for benzene was exceeded in three soil samples located near the former Amoco blowdown pit excavation, collected at depths ranging from 12 feet bgs to 22 feet bgs. The concentration of benzene in these three soil samples ranged from 12 mg/kg to 48 mg/kg.

The NMOCD standard of 50 mg/kg for total BTEX was exceeded in nine soil samples: five soil samples collected west of the former Amoco blowdown pit excavation, one sample collected immediately east of the former Amoco blowdown pit excavation, two soil samples collected between the former Amoco blowdown pit excavation and the former EPFS production pit excavations, and one soil sample collected east of the former EPFS production pit excavation. The concentration of total BTEX in these soil samples ranged from 77.7 mg/kg to 80.2 mg/kg in B-7 to 768.6 mg/kg in B-14. The soil sample from B-14 was collected from a depth of 13 feet bgs, the other eight soil samples were collected at depths ranging from 16 feet bgs to 22 feet bgs.

The NMOCD standard of 100 mg/kg for TPH was exceeded in 12 soil samples: seven soil samples collected from west, north, and east of the former Amoco blowdown pit excavation, four

soil samples collected between the former Amoco blowdown pit and former EPFS production pit excavations, and one soil sample collected east of the former EPFS production pit excavation. The concentration of TPH in these soil samples ranged from 193 mg/kg in B-18 to 6,700 mg/kg in B-14. One soil sample (B-14) was collected at a depth of 13 feet bgs, the other eleven were collected at depths ranging from 16 feet bgs to 24 feet bgs.

4.2 GROUNDWATER

Groundwater elevations ranged from 5,552.80 feet above mean sea level (amsl) in MW-4 to 5,555.80 feet amsl in MW-9 on March 2, 2011 (Table 2). Groundwater flow direction on March 2, 2011 was generally to the south and west, toward the irrigation ditch (Figure 9) except between MW-6 and MW-7, where a groundwater divide is present. The groundwater near and west of MW-6 was flowing to the west and the groundwater in the vicinity of MW-7 was flowing to the east.

Groundwater analytical results from the January 14, 2011, and March 10, 2011 sampling events indicate MW-1R, MW-3R, MW-4, and MW-9 do not contain detectable concentrations of any BTEX parameter. Concentrations of benzene in MW-5 exceed the New Mexico Water Quality Control Commission (NMWQCC) groundwater standards for benzene and total xylenes. Concentrations of benzene, toluene, and total xylenes in MW-7 and MW-8 exceed the NMWQCC groundwater standard for benzene, toluene, and total xylenes; and concentrations of all BTEX compounds exceed the NMWQCC groundwater standard in MW-2 and MW-6. Figure 9 depicts the groundwater analytical results from the January 14 and March 10, 2011 sampling events and Table 3 summarizes the historical groundwater analytical results. The groundwater laboratory analytical reports can be found in Appendix E.

5.0 DATA INTERPRETATION

5.1 LOCAL GEOLOGY AND HYDROLOGY

The material encountered below the Site was deposited in a floodplain, fluvial, or lacustrine setting and a paleochannel was carved beneath the Site that eventually filled with fine-grained material that settled out as the topography flattened and water and debris flow was slowed. This is the zone containing shallow groundwater.

Cross-section C-C' has a lense of sandy silt within the consolidated sand and cross-section B-B' has a lense of silty sand within the consolidated sand which indicate that the consolidated sand unit is not homogeneous and implies water and contamination may penetrate more readily. On cross-section C-C', the shape of the impacted area mirrors the channel shape above it, implying this area is a low point for water collection and has been eroded over time and to become less resistant to erosion than the surrounding consolidated sand, therefore allowing the vertical migration of water and contamination.

It does appear that the contamination migrated vertically from the source areas through the silty sand to the groundwater, which appears to occur primarily atop the consolidated sand with some interconnection in less resistant/less consolidated areas of the consolidated sand unit. The impact to the east on cross-section A-A' appears to be from the former EPFS production pit and the

impact to the west appears to be from the former Amoco blowdown pit and former Amoco separator pit with some commingling. The impact appears to migrate within water to the southwest within the paleochannel atop the consolidated sand with limited vertical migration when the water table fluctuates.

Groundwater elevation along the southwestern and central portion of the Site is highly influenced by the presence of water in the irrigation ditch through seasonal wetting and drying cycles. Hysteresis in the hydrology of the Site likely causes the spring wetting cycle (March thru June) to be of shorter duration when compared to the winter drying cycle (September through March). Observed groundwater elevation fluctuations in groundwater monitoring well MW-1R have been greater than 9 feet during a 3-month wetting cycle in 2007 and have been over 8 feet during a 6-month drying cycle in 2009-2010 (Table 2). Groundwater monitoring well MW-4 exhibits similar trends. The large variability in groundwater elevation attributable to the presence of water in the ditch is lessened as the groundwater table progresses east across the Site and does not appear to be observed in groundwater monitoring wells east of MW-6. The lithologic rise in the consolidated sand unit just west of groundwater monitoring well MW-7 appears to contribute to this lessening effect. The groundwater elevation in groundwater monitoring wells MW-7 and MW-8 does not appear to be influenced by the presence of water in the ditch; observed groundwater elevation fluctuations in MW-7 and MW-8 average 2 feet to 3 feet seasonally.

Groundwater flow direction is highly variable at the Site due to the presence or absence of water in the irrigation ditch and resulting wetting and drying cycles. During wetting cycles, groundwater flow is to the east/northeast, away from the irrigation ditch; however, once the drying cycle begins, groundwater flow direction slowly migrates toward the west/southwest, toward the irrigation ditch.

The petroleum hydrocarbon impact in the consolidated sand unit is likely attributed to period(s) of low groundwater elevation in which petroleum hydrocarbon impacted groundwater migrated into the underlying consolidated sand and remained in the groundwater smear zone.

5.2 SOIL IMPACT

Impacted soil is primarily within the sandy clay unit, although impacted soil extends into the consolidated sand unit in soil borings B-28, B32, and B33. This coincides with thinning or absence of the sandy clay unit where the consolidated sand unit rises in elevation. It is not known how far to the south and southeast, in the vicinity of soil boring B-6 and B-7, the petroleum hydrocarbon impact in the consolidated sand unit extends since soil borings B-6, B-7, B-8, and B-25 did not penetrate the consolidated sand unit. Potential impact east of the former EPFS production pit is also not fully defined. In the vicinity of monitoring well MW-8, and soil borings B-18 and B-19, near the former EPFS production pit where the shallower depression is located, the soil impact is primarily within the sandy clay unit that fills the shallower depression. This trend is also observed in the larger depression near soil borings B-10, and B-12, where the sandy clay unit is impacted by petroleum hydrocarbons. The elevation of the top of petroleum hydrocarbon impacted soil is depicted in Figure 10.

The TPH impact in the consolidated sand unit (B-28 and B-32) is comprised primarily of the DRO fraction (80-90% DRO); whereas the TPH impact in the sandy clay unit (B-6, B-7, B-10,

B-11, B-12, B-14, B-18, B-19, and B-24) is comprised primarily of the GRO fraction (70-95% GRO). This may be a result of the higher clay content of the sandy clay unit and the GRO fraction preferentially adsorbing to the finer grained sediments, or it may be a result of the GRO fraction being more volatilized during the blowdown process, resulting in a higher fraction of DRO impact to soil in this area.

The lateral extent of soil impacted by petroleum hydrocarbons in excess of the NMOCD standards is limited to the central portion of the Site in a general east to west alignment following the trend of the two consolidated sand depressions. Soil impact is defined in soil borings to the north by B-27 and B-29, to the east by B-21 and B-22, to the south by B-5 and B-3 and to the west by B-2, B-9, and B-26, yet remains undefined to the southeast (southeast of B-8 and B-25) and east (east of MW-8).

The vertical extent of petroleum hydrocarbon impacted soil in the sandy clay unit is approximately 24 feet bgs in the west as observed in soil boring B-10, and approximately 17 feet bgs in the east as observed in soil boring B-17. The vertical extent of petroleum hydrocarbon impacted soil in the consolidated sand is deepest in soil boring B-32, extending to 30 feet bgs. The thickest section of impacted soil occurs near soil boring/monitoring well B-12/MW-6, where impacted soil is approximately 16 feet thick. Based on this distribution, an estimated total of approximately 13,000 cubic yards of soil are impacted by BTEX and/or TPH above the NMOCD standards at the Site.

5.3 GROUNDWATER IMPACT

Groundwater monitoring wells MW-1R, MW-3R, MW-4, and MW-9 do not have concentrations of benzene, toluene, ethylbenzene, or total xylenes exceeding the NMWQCC groundwater standards. Groundwater is impacted by benzene, toluene, ethylbenzene, or total xylenes above the NMWQCC groundwater standards in groundwater monitoring wells MW2R, MW-5, MW-6, MW-7, and MW-8. The BTEX concentrations in MW-7 are historically less than either MW-8 or MW-6; indicating there may be two separate sources that have comingled in this area (Figure 11).

The western groundwater plume is likely derived from petroleum hydrocarbon impacted soil left in place after excavation of the former Amoco blowdown pit. The eastern groundwater plume appears to be sourced from petroleum hydrocarbon impacted soil left in place after excavation of the former EPFS production pit. The extent of the groundwater contaminant plume is defined to the north by MW-9, to the west by MW-1R and MW-4, and to the south by MW-3R, and to the west by MW-1R and MW-4; however the groundwater contaminant plume is not defined to the southeast, east, and northeast.

6.0 SUMMARY AND CONCLUSIONS

Soil at the Site has been impacted by historical releases of petroleum hydrocarbons from three known sources (former Amoco blowdown pit former Amoco separator pit, and former EPFS production pit). The petroleum hydrocarbon impact attributable to these multiple sources is comingled in subsurface soil and groundwater at the Site and can be loosely characterized by a

western source area (the former Amoco blowdown pit, and former Amoco separator pit) and an eastern source area (the former EPFS production pit).

Petroleum hydrocarbon impact to soil resides primarily in the sandy clay unit with a lesser area of the underlying consolidated sand unit also being impacted by petroleum hydrocarbons. The upper silty sand is not impacted by petroleum hydrocarbons. Petroleum hydrocarbon impact to soil is encountered at the shallowest depth of 10 feet bgs and extends to a maximum depth of 27 feet bgs. The lateral extent of petroleum hydrocarbon impact to soil extends at least 300 feet from east to west (the eastern extent is not completely defined) and approximately 150 feet from north to south. Based on this distribution, an estimated total volume of 13,000 cubic yards of impacted soil exists in the subsurface.

Groundwater flow direction and elevation fluctuation at the Site appear to be in response to the presence of water in the nearby irrigation ditch. This influence is reduced farther away from the ditch. When water is present in the ditch, groundwater flow is east/northeast away from the ditch; this trend reverses during the drying cycle when water flow ceases in the ditch and groundwater flow gradually returns west/southwest toward the ditch.

Groundwater has been impacted by BTEX concentrations in excess of the NMWQCC groundwater standards in monitoring wells MW-2R, MW-5, MW-6, MW-7, and MW-8; BTEX in groundwater in monitoring wells MW-1R, MW-3R, MW-4, and MW-9 remain below the NMWQCC standards. BTEX concentrations in MW-7 remain consistently lower than adjacent MW-8 and MW-6, indicating there are likely two separate groundwater plumes that have comingled. BTEX impact in groundwater is defined to the north, south, and west; yet remain undefined to the east.

7.0 LIMITATIONS

No investigation is infallible. Some uncertainty will always exist concerning the presence or absence of potential contaminants at a particular property, irrespective of the rigor of the investigation. Accordingly, LTE does not warrant that contaminants, other than those identified in this report, do not exist at the subject property or may not exist there in the future.

LTE believes that it has performed the services summarized in this report in a manner consistent with the level of care and skill ordinarily exercised by members of the environmental profession practicing at the same time and under similar conditions in the area of the project.

EQUIPMENT USED EXCAVATOR

DATE STARTED 10-20-93
DATE FINISHED 10-27-93

ENVIRONMENTAL SPECIALIST REO

SOIL REMEDIATION QUANTITY EXCAVATION APPROX. 40' X 75' X 20' MAX. DEEP.

DISPOSAL FACILITY CROUCH MESA

LAND USE RESIDENTIAL/INDUSTRIAL

SURFACE CONDITIONS EXCAVATED PRIOR TO ARRIVAL

FIELD NOTES & REMARKS: PIT LOCATED APPROXIMATELY 125 FEET SOUTH FROM WELLHEAD.
EXCAVATION 15-20' DEEP - TOP 8-10' APPEARS UNCONTAMINATED. FROM 8-10' DOWN,
HEAVY CONTAMINATION EVIDENCED BY DARK GRAY TO BLACK, WITH HEAVY PETROLEUM ODOR.
SOIL IS SILTY SAND, BOTTOM @ 18-20' IS SANDSTONE BEDROCK. WATER SLURRY
SPRINGING INTO EXCAVATION.
IRRIGATION CANAL ~ 100' DOWNGRADIENT TO THE SOUTHWEST.
EXCAVATION CONTINUING ON WEST END OF PIT AT THIS TIME,
10/21' LEDGE ROCK ON SOUTH EDGE OF EXCAVATION @ ~ 12' DEEP. COARSE SAND SOIL.

Denny EL PASO FIELD SERVICES
PRODUCTION PIT CLOSURE
DEPUTY OIL & GAS INSPECTOR

OK

DEC 21 1993

BRUINGTON GAS COM #1
Meter/Line ID - 73746

RECEIVED
JUL 2 1993

Legals - Twn: 29 Rng: 11
NMOCID Hazard Ranking: 20
Operator: AMOCO PRODUCTION COMPANY

SITE DETAILS

Sec: 14 Unit: E
Land Type: 4 - Fee
Pit Closure Date: 04/28/94

RATIONALE FOR RISK-BASED CLOSURE:

The above mentioned production pit was assessed and ranked according to the criteria in the New Mexico Conservation Division's Unlined Surface Impoundment Closure Guidelines.

The primary source, discharge to the pit, has been removed. There has been no discharge to the production pit for at least five years and the pit has been closed for at least three years.

The production pit has been remediated to the practical extent of the trackhoe or to the top of bedrock. Initial laboratory analysis has indicated that the soil remaining at the bottom of the excavation is above standards based on the hazard ranking score. Contaminated soil was removed and transported to an approved landfarm for disposal. The initial excavation was backfilled with clean soil and graded in a manner to divert precipitation away from the excavated area. Any rainfall that does infiltrate the ground surface must migrate through clean backfill before reaching any residual hydrocarbons remaining in the soil. Therefore, further mobility of residual hydrocarbons is unlikely.

Since the soil samples from the initial excavation were above standards, a test boring was drilled and a sample was collected to evaluate the vertical extent of impact to soils. Test boring sample results indicated soils below standards beneath the original excavation.

El Paso Field Services Company (EPFS) requests closure of the above mentioned production pit location for the following reasons:

- Discharge to the pit has not occurred in over five years and the pit has been closed for over three years.
- The bulk of the impacted soil was removed during the initial excavation.
- The excavation was backfilled with clean soil and graded to divert precipitation away from the excavation area.
- All source material has been removed from the ground surface, eliminating potential direct contact with livestock and the general public.
- Groundwater was not encountered in the initial excavation or test boring; therefore, impact to groundwater is unlikely.
- Soil samples collected beneath the initial excavation were below standards.
- No potential receptors are within 1,000 feet of the site.
- Residual hydrocarbons remaining in the soil at the bottom of the initial excavation will naturally degrade in time with minimal risk to the environment.

Project Name/Number: PIT CLOSURE 24324

Attention: John Lambdin

On 05/03/94, Analytical Technologies, Inc., (ADHS License No. AZ0015), received a request to analyze **non-aqueous** samples. The samples were analyzed with EPA methodology or equivalent methods. The results of these analyses and the quality control data, which follow each set of analyses, are enclosed.

EPA Method 8015 analysis was added on 05/05/94 for sample 945008 per Stacy Sendler.

The matrix spike/spike duplicate data from the samples extracted on 05/05/94 is reported twice reflecting quantification using both the internal standard and external standard protocols. Both protocols were employed to quantify the samples submitted for this project.

If you have any questions or comments, please do not hesitate to contact us at (505) 344-3777.

Attention: John Lambdin

On 06/16/95, Analytical Technologies, Inc., (ADHS License No. AZ0015), received a request to analyze **non-aqueous** samples. The samples were analyzed with EPA methodology or equivalent methods. The results of these analyses and the quality control data, which follow each set of analyses, are enclosed.

If you have any questions or comments, please do not hesitate to contact us at (505) 344-3777.

The diagram shows a vertical borehole profile from 11' to 22'. Key features include:

- 11' - 16': A section with a cross-hatch pattern.
- 12-13.75': A section labeled "no recovery".
- 13.75 - 14': A section labeled "same as above".
- 14-16': A section labeled "black, sandy clay, HC odor".
- 16-20': A section labeled "16-16.5' NO Recovery".
- 16.5": A section labeled "dark gray sandy clay, HC odor, saturated @ 16.5'".
- 20-24': A section labeled "20-24' 1" of no recovery".
- 20.1"-23.8": A section labeled "dark gray sandy clay, HC odor".

 Other markings include "HC odor" at 16' and "18 = 19.29" at the bottom.

					10				
					11				

The bore log diagram shows three distinct soil profiles. Profile 1 (0-2.5') is labeled 'no recovery'. Profile 2 (3.5-5') is described as 7.5% s/s yellowish brown, silty sand, 30% silt, 40% fine sand, 30% med sand, and is labeled 'loose'. Profile 3 (9-10') is described as 7.5% s/s yellowish brown sand, 70% fine sand, 30% med sand, and is labeled 'loose & soft'. Sample locations are marked at depths 0, 4, 9, and 10 feet.

					14	
					15	
					16	
					17	
					18	
					19	
					20	
					21	
					22	

The diagram illustrates the borehole completion with various soil profiles labeled from top to bottom:

- Profile 1 (11-13.75'): No Recovery, Silt, slightly fine sand, 40% silt, 55% fine sand, 5% med sand.
- Profile 2 (13.75-14.5'): 13.75' - 14.5' silty fine sand, slight plasticity, 40% silt, 55% fine sand, 5% med sand.
- Profile 3 (14.5-15'): 14.5' - 15' 10-40% dark gray sand, silty to clayey fine sand, slight plasticity, 60% silt, 10% clay, 30% fine sand.
- Profile 4 (15-18'): 15-18' No Recovery, 50% fine sand, 40% med sand, 10% coarse, fairly loose sand, strong odor.

Sample locations are indicated by vertical lines at depths 11, 14, 15, 18, and 19 feet. Sample numbers B-28 and 18' are also noted near the 18' mark.

The diagram illustrates the borehole completion with various soil profiles and recovery data. The borehole depth is marked from 0 to 11 feet below ground surface (bgs.).

- 0-2' (Top):** Labeled "0-2' NO Recovery". Soil type is SM (Silty sand) with 2-5' 10% 4/16 dark yellow brown, 50% fine sand, 35% mid sand, loose.
- 5-8':** Labeled "5-8' NO Recovery". Soil type is SM (Silty sand) with 8-8.5' same as above.
- 8.5-10':** Labeled "8.5-10' sandy silt, 60% silt, 40% fine to very fine sand, semi-consolidated, compact". Soil type is ML (Muddy loam).
- 10-10.5':** Labeled "10-10.5' NO Recovery". Soil type is ML (Muddy loam) with same as above.

APPENDIX D
SOIL LABORATORY ANALYTICAL REPORTS

COVER LETTER

Tuesday, November 17, 2009

Kim Champlin
XTO Energy
382 County Road 3100
Aztec, NM 87410

TEL: (505) 333-3207
FAX (505) 333-3280

RE: Bruington GC #1

Order No.: 0910559

Dear Kim Champlin:

Hall Environmental Analysis Laboratory, Inc. received 33 sample(s) on 10/30/2009 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

A handwritten signature in black ink, appearing to read "Andy Freeman".

Andy Freeman, Laboratory Manager

Attachment A
List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L496949-02	WG516936	SAMP	Total Xylene	R1535971	B3
L496949-03	WG516936	SAMP	TPH (GC/FID) Low Fraction	R1535971	J3
			Total Xylene	R1535971	B3

Attachment B
Explanation of QC Qualifier Codes

Qualifier	Meaning
B3	(ESC) - The indicated compound was found in the associated method blank, but all reported samples were non-detect.
J3	The associated batch QC was outside the established quality control range for precision.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

Precision - The agreement between a set of samples or between duplicate samples. Relates to how close together the results are and is represented by Relative Percent Difference.

Surrogate - Organic compounds that are similar in chemical composition, extraction, and chromatography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.

TIC - Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

Daphne

On the COC we prepared for the XTO GW Monit. – Bruington water samples we collected on 1/13/11 and you should have received on 1/14/11 (today); we put the incorrect "Client Project #" as XTO1002. Can you please correct this project number on the COC to "XTO1001". The sample jar labels were also all incorrectly labeled with XTO1002 and should be XTO1001. Thank you for your attention to this matter.

Julie

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.

Water Sample Collection Form

Sample Location Brunswick GC #1
 Sample Date 12/17/13
 Sample Time 1545
 Sample ID MW-9
 Analyses BTEX
 Matrix GW
 Turn Around Time Standard
 Trip Blank ND
 Depth to Water 15.44
 Time 1515
 Vol. of H₂O to purge 30.46 - 15.44 = 15.02 \times 0.1631 = 2.449762 \times 3 = 7.3492
 Method of Purging Baiter
 Method of Sampling Baiter

Client XTO
 Project Name Groundwater Sampling
 Project # 012911009
 Sampler JN
 Laboratory ESC
 Shipping Method Fed EX
 Other QA/QC Standard
 TD of Well 30.46
 Depth to Product N/A

(height of water column * 0.1631 for 2" well or 0.6524 for 4" well) * 3 well vols

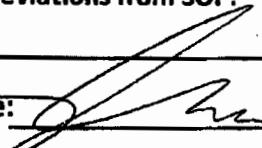

Time	Vol. Removed (gal.)	Total Vol H ₂ O removed (gal.)	pH (std. units)	F Temp. (C)	Conductivity (us or ms)	Comments
1515	0.25	0.25	9.11	38.6	38.6	yellow, clear
	0.25	0.50	6.15	39.2	38.8	yellow/brown
