Subject: Red WTR Station

Due to the COG SWD being down we are having to haul our water. We had two trucks loading and apparently they both fell asleep which caused our tanks to over flow while we were still producing. Approximately 170bbbls of produced water was released, we recovered 130bbbls from inside of the berms and 30bbbls from the location. COG should have their line repaired by the end of the week. That's when we will start the remediation. We will have hand crews for inside the battery and will start with equipment on the location once the line is repaired. We will remediate the location according to standard and will discuss with you the findings on the bermed area. C141 to follow.
