Downhole Commingling
F. F. Hardison "B" #4
Unit B, Section 34, T21S, R37E
Lea County, New Mexico

New Mexico Oil Conservation Division
P. O. Box 2088
Santa Fe, NM 87504

Attention: Mr. David R. Catanach

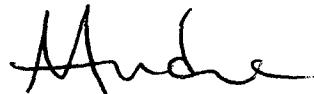

Exxon Corporation requests an exception to New Mexico Oil Conservation Division Rule 303-A to permit downhole commingling of production from the Blinebry Oil and Gas and Drinkard pools in the captioned wellbore.

The well is currently a dual completion with the Drinkard producing 4 bopd and 163 mcfpd on plunger lift up the tubing and the Blinebry is dead in the casing-tubing annulus (see attached wellbore schematic). The Blinebry has been shut-in during the 12 months ending 5/31/90. The well has a static fluid level of 4000' and casing pressure of only 10 psig. By downhole commingling the Blinebry with the economic Drinkard completion and artificially lifting both zones, Exxon will be able to recover additional reserves from the Blinebry that would not otherwise be recovered.

Exxon proposes to perforate the tubing to establish communication with the Blinebry, and to artificially lift remaining reserves out of both zones simultaneously using plunger lift.

All offset operators have been notified by copy of this letter and its attachments.

Sincerely,

Michael W. Andrews
Compliance Supervisor

Attachment 2
F. F. Hardison "B" #4
Downhole Commingling - Data Required

To obtain approval for downhole commingling, we have enclosed the following data pursuant to Rule 303 (C) (2) (a through j):

1. Exxon's name and address:

Exxon Corporation
P. O. Box 1600
Midland, TX 79702

2. Lease name, well number, well location, and name of pools to be commingled:

F. F. Hardison "B" No. 4, Unit B, Section 34, T-21-S, R-37-E, Lea County, New Mexico. Pools to be commingled: Blinebry Oil and Gas and Drinkard.

3. A plat of the area showing the acreage dedicated to the well and ownership of all offsetting leases:

Attached.

4. A 24-hour productivity test on Division Form C-116 showing the amount of oil, gas, and water produced from each zone:

Tests for the Blinebry Oil and Gas and Drinkard are attached.

5. A production decline curve for zones showing that for a period of at least one year a steady rate of decline has been established for each zone which will permit a reasonable allocation of the commingled production to each zone for statistical purposes:

Decline curves for the Blinebry and Drinkard are attached.

6. A current bottomhole pressure for each zone capable of flowing:

Measured shut-in bottomhole pressure is 421 psig for the Drinkard (measured by static downhole pressure bomb in the F. F. Hardison "B" #4), and 492 psig for the Blinebry (estimated from static fluid level in the tubing-casing annulus in the F. F. Hardison "B" #4).

7. A description of the fluid characteristics of each zone showing that the fluids will not be incompatible in the wellbore:

Produced fluids are already surface commingled with no compatibility problems.

F. F. HARDISON "B" #4
DOWNHOLE COMMINGLING APPLICATION

8. A computation showing that the value of the commingled production will not be less than the sum of the values of the individual streams:

All of the crude and condensate currently produced from the Blinebry and Drinkard is already being surface commingled into one common stock tank, and sold as a mixture.

9. A formula for the allocation of production to each of the commingled zones and a description of the factors or data used in determining such a formula:

The Drinkard has produced an average of 4 bopd and 120 mcfpd during the 12 months ending 5/31/90. The contribution from the Blinebry will be determined by subtracting the prior rate of the Drinkard from the total commingled rate. A test period of 2 to 3 weeks will be used to obtain a stabilized rate prior to submitting the allocation formula.

10. A statement that all offset operators and, in case of a well on Federal land, the United States Geological Survey, has been notified in writing of the proposed commingling.

By copy of this letter, we are notifying the offset operators of this proposed commingling.

11. In addition, working interest and royalty interest ownership in all zones are the same.

Instructions:

During gas-oil ratio test, each well shall be produced at a rate not exceeding the top unit allowable for the pool in which well is located by more than 25 percent. Operator is encouraged to take advantage of this 25 percent tolerance in order that well can be assigned increased allowables when authorized by the Division.
 Gas volumes must be reported in MCF measured at a pressure base of 15.025 psia and a temperature of 60° F. Specific gravity base will be 0.60.
 Report casing pressure in lieu of tubing pressure for any well producing through casing.

(See Rule 301, Rule 1116 & appropriate pool rules.)

I hereby verify that the above information is true and complete to the best of my knowledge and belief.
