We had discussed having hit some pretty hard material in the bottom of that excavation, and since groundwater is fairly deep, I will go ahead and sign off on this one. If salt wicking back up becomes an issue later on, the site may need to be readdressed, but that is not something OCD really monitors at this time.

Thanks,

Mike Bratcher

Mike, Since there is deep ground water, a solid barrier to prevent downward migration and impacted soils removed will that justify analytical results and request of closure as submitted?

Thanks, Bob.

I didn't catch this until after hitting send. The site diagram lists the well in 36-25s-28e, and I was only looking at that. I have a clean-up going on in that area and groundwater is less than 100' for the most part. This well is actually in 31e, which from what I can see, is going to be as you called it, 300'-400'. All of the other documents list 31e as the range, so if OK with you, I will just make a correction on the diagram. Until I get different directions, OCD would like to see a more complete delineation of spill sites, especially where contaminant levels are 5 digits and increasing with depth. Thanks - Mike

Mike, No there was no sampling any deeper than the 1.5', when we were sampling we hit a cemented layer of caliche. The contractor removed the impacted material per our discussion in August, with no further sampling required. Please advise on anything else. Thanks, Bob Asher.

Bob,

Is there any sample data available below the 1.5' (3.5'bsl) area just off well pad? It is marked yellow on the site diagram.
