NATURE OF RELEASE

Type of Release	Produced water and oil	Volume of Release	4 bbls	Volume Recovered	0 bbls
Source of Release	1 in. nipple on well head	Date and Hour of Occurrence	5/15/14	Date and Hour of Discovery	5/15/14
Was Immediate Notice Given?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Not Required	If YES, To Whom?			
By Whom?		Date and Hour			
Was a Watercourse Reached?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No	If YES, Volume Impacting the Watercourse.			
If a Watercourse was Impacted, Describe Fully.*					

Describe Cause of Problem and Remedial Action Taken.* A cow rubbed up against 1 in. nipple on well head. Shut valve and installed fence around well head.

Describe Area Affected and Cleanup Action Taken.* A total of 4 barrels of produced water and oil was released over 1,177 square feet of lease pad and pasture land. RECS personnel were on site beginning on June 3rd, 2014 to assess the release. Four points within the release area were sampled at the surface, and three points were sampled with depth. All samples were field tested for chlorides and organic vapors, and representative samples were taken to a commercial laboratory for analysis. Point 1 returned elevated laboratory chloride levels until 5.5 ft bgs. Point 2 returned elevated chloride levels until 1 ft bgs, and Point 3 and Point 4 returned chloride levels below regulatory standards at the surface. GRO readings at all points and all depths returned values of non-detect. DRO readings were elevated at the surface of Point 1 and Point 2, but fell below regulatory standards at depth. Point 3 returned DRO values above regulatory standards at the surface and 6 inches bgs, but at 1 ft bgs returned a DRO value below regulatory standards. Point 4 returned a DRO value of non-detect at the surface. Based on the lab data, a CAP was submitted to and approved by NMOCDD on June 25th, 2014. Corrective actions began at the site on July 8th, 2014. Micro-Blaze was applied to the overspray area to wash the vegetation and degrade the hydrocarbons. The remainder of the site was excavated in four parts. The north portion was excavated to 5 ft bgs and 2 ft bgs. The central portion was scraped to 1 ft bgs, and the southern portion, in the pasture, was scraped to 2 ft bgs. All excavated soils to a total of 92 cubic yards of soil were taken to a NMOCDD approved facility for disposal. Composite samples from the base of each scrape or excavation were taken to a commercial laboratory to confirm that chloride and TPH values were below regulatory standards. On July 10th, 2014, NMOCDD approved the site to be backfilled. A total of 108 cubic yards of caliche and 12 cubic yards of top soil were imported to the site to serve as backfill. A sample of the imported backfill was taken to a commercial laboratory for analysis and returned a chloride reading of non-detect. The lease pad was backfilled with the imported caliche and the pasture was backfilled with the imported top soil. Both areas were contoured to the surrounding location. On July 10th, 2014, the site was seeded with Lea County Mix.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCDD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCDD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCDD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.
