STANDARD OF CARE

Site Characterization

Julio State #1

Ref. #160052

The information provided in this report was collected consistent with the New Mexico Oil Conservation Division (NMOCD) *Guidelines for Remediation of Leaks, Spills and Releases* (August 13, 1993), the NMOCD *Unlined Surface Impoundment Closure Guidelines* (February, 1993) and Environmental Plus, Inc. (EPI) *Standard Operating Procedures and Quality Assurance/Quality Control Plan.* The conclusions are based on field observations and laboratory analytical reports as presented in the report. Recommendations follow NMOCD guidance and represent the professional opinions of EPI staff. These opinions were derived using currently accepted geologic, hydrogeologic and engineering practices at this time and location. The report was prepared or reviewed by a certified or registered professional with a background in engineering, environmental and/or natural sciences.

This report was prepared by:

100 Ategemoli-Jason Stegemoller

Environmental Scientist

1.0 **PROJECT SYNOPSIS**

Site Specific:

- Company Name: Chesapeake Operating, Inc.
- Facility Name: Julio State #1
- ♦ Project Reference: 160052
- Company Contacts: Bradley Blevins
- Site Location: WGS84 N32° 33' 49.44"; W103° 04' 26.54"
- Legal Description: Unit Letter-D, (NW¼ of the NW¼), Section 20, T 20 S, R 39 E
- General Description: Approximately 10-miles northeast of Eunice, New Mexico
- Elevation: 3,515-ft amsl
- Land Ownership: McCasland Limited Partnership
- EPI Personnel: Project Consultant Iain Olness Site Foreman – David Robinson

Release Specific:

- Product Released: Crude oil and production fluids
- Volume Released: ~10-barrels Volume Recovered: ~5-barrels
- Time of Occurrence: 8 March 2006 Time of Discovery: 8 March 2006
- Release Source: Well kicked during work over activities
- Initial Surface Area Affected: ~ 5,400 square feet with ~36,600 square feet impacted by overspray.

Remediation Specific:

- ♦ Final Vertical Extent of Contamination: <5-feet bgs
- Depth to Ground Water: Approximately 40-feet bgs
- Water Wells Within 1,000-ft: 2
- Private Domestic Water Sources Within 200-ft: 0
- Surface Water Bodies Within 1,000-ft: Ephemeral Stream and a Stock Pond
- NMOCD Site Ranking Index: 30 points (<50-ft to top of water table, <1,000-ft to surface water bodies)
- Remedial Goals for Soil: TPH 100 mg/Kg; BTEX 50 mg/Kg; Benzene 10 mg/Kg; Chloride and sulfate residuals may not be capable of impacting groundwater above NMWQCC groundwater standards of 250 mg/Kg and 600 mg/Kg, respectively.
- **RCRA Waste Classification:** Exempt
- Remediation Option Selected: a) Excavation of contaminated soil above NMOCD remedial goals and/or NMWQCC groundwater standards with disposal at Sundance Services, Inc.; b) laboratory analyses to confirm removal of soil impacted above NMOCD remedial thresholds and NMWQCC groundwater standards in excavation bottom; and, c) backfill the excavation
- Disposal Facility: Sundance Services, Inc.- Eunice, New Mexico
- Volume Disposed: 210-yd³
- Project Completion Date: May 12, 2006

2.0 SITE AND RELEASE INFORMATION

- 2.1 Describe the land use and pertinent geographic features within 1,000 feet of the site. Land surrounding the area is rangeland in native grasses and would be utilized for livestock grazing.
- 2.2 Identify and describe the source or suspected source(s) of the release. Well kicked during work over activities.
- 2.3 What is the volume of the release? (if known): <u>10</u> barrels of crude oil and production fluids
- 2.4 What is the volume recovered? (if any) <u>5</u> barrels
- 2.5 When did the release occur? (if known): <u>8 March 2006</u>

2.6 Geological Description

The United States Geological Survey (USGS) Ground-Water Report 6, "Geology and Ground-water Conditions in Southern Lea County, New Mexico," A. Nicholson and A. Clebsch, 1961, describes the near surface geology of southern Lea County as "an intergrade of the Quaternary Alluvium (QA) sediments (i.e., fine to medium sand) with the mostly eroded Cenozoic Ogallala (CO) formation. Typically, the QA and CO formations in the area are capped by a thick interbed of caliche and generally overlain by sandy soil."

The release site is located in the Eunice Plains physiographic subdivision, described by Nicholson & Clebsch as an area that "is underlain by a hard caliche surface and is almost entirely covered by reddish-brown dune sand. The sand cover is 2 to 5 feet thick over most of the area."

2.7 Ecological Description

The area is typical of the Upper Chihuahuan Desert Biome consisting primarily of sandy soil covered with short, semi-arid grasses, interspersed with Honey Mesquite and forbs. Mammals represented include Orrd's and Merriam's Kangaroo Rats, Deer Mouse, White Throated Wood Rat, Cottontail Rabbit, Black Tailed Jackrabbit, Mule Deer, Bobcat, Red Fox and Coyote. Reptiles, amphibians and birds are numerous and typical of the area. A survey of Listed, Threatened or Endangered species was not conducted.

2.8 Area Groundwater

The unconfined groundwater aquifer at this site is projected to be approximately 40-ft bgs based on water depth data obtained from the New Mexico State Engineers Office and the United States Geological Survey data base (reference *Table 1*).

2.9 Area Water Wells

There are two water supply wells located within a 1,000-foot radius of the release site as indicated by USGS water well data. However, there are no private, domestic fresh water wells or springs used by less than five households for domestic or stock watering purposes located within a 200-foot radius of the release site (reference *Figure 2*).

2.10 Area Surface Water Features

There is a pond utilized for livestock watering within a 1,000 foot radius of the release site.

3.0 <u>NMOCD SITE RANKING</u>

Contaminant delineation and remedial work done at this site indicate chemical parameters of the soil and physical parameters of the groundwater were characterized consistent with the characterization and remediation/abatement goals and objectives set forth in the following New Mexico Oil Conservation Division (NMOCD) publications:

- Guidelines for Remediation of Leaks, Spills and Releases (August 13, 1993)
- Unlined Surface Impoundment Closure Guidelines (February, 1993)
- <u>Pit and Below-Grade Tank Guidelines (November, 2004)</u>

Acceptable thresholds for contaminants/constituents of concern (CoC) were determined based on the NMOCD Ranking Criteria as follows:

- Depth to Groundwater (i.e., distance from the lower most acceptable concentration to groundwater);
- Wellhead Protection Area (i.e., distance from fresh water supply wells);
- Distance to Surface Water Body (i.e., horizontal distance to all down gradient surface water bodies).

Based on the proximity of the site to protectable area water wells, surface water bodies, and depth to groundwater from the lower most contamination, the NMOCD ranking score for the site is fifty points with the soil remedial goals highlighted in the Site Ranking table presented below:

1. GROUND	VATER	2. WELLHEAD PROTECTION AREA	3. DISTANCE TO SURFACE WATER
Depth to GW <50 fee	et: 20 points	If <1,000' from water source, or <200' from	<200 horizontal feet: 20 points
Depth to GW 50 to 9 10 points	9 feet:	private domestic water source: 20 points	200-1,000 horizontal feet: 10 points
Depth to GW >100 fe	eet: 0 points	If >1,000' from water source, or >200' from private domestic water source: <i>0 points</i>	>1,000 horizontal feet: <i>0 points</i>
Site Rank (1+2+3) =	20 +20 +10 =	30 points	
	Total Site	Ranking Score and Acceptable Remedial Goa	al Concentrations
Parameter	20 (or > 10	0
Benzene ¹	10 p	ppm 10 ppm	10 ppm
BTEX ¹	50 p	ppm 50 ppm	50 ppm
ТРН	100	ppm 1,000 ppm	5,000 ppm

A field soil vapor headspace measurement of 100 ppm can be substituted in lieu of laboratory analyses for benzene and BTEX.

4.0 EXCAVATED SOIL INFORMATION

4.1 Was soil excavated for off-site treatment-or disposal? Xes \Box No

Date excavated: March 14 – 20, 2006

Total volume removed: Approximately 210 cubic yards

4.2 Indicated soil treatment type:

Disposal
Land Treatement
Composting/Biopiling
Other ()

Name and location of treatment/disposal facility: Sundance Services, Inc. – Eunice, New Mexico

5.0 SAMPLING INFORMATION

5.1 Briefly describe the field screening methods used to distinguish contaminated from uncontaminated soil.

Organic Vapor Concentrations – A portion of each soil sample collected was inserted into a self-sealing polyethylene bag to allow volatilization of organic vapors. After the samples equilibrated to $\sim 70^{\circ}$ F, they were analyzed for organic vapors utilizing a MiniRae® Photoionization Detector (PID) equipped with a 10.6 electron volt (eV) lamp.

Chloride Concentrations – A LaMotte Chloride Test Kit was utilized for field analyses of chloride concentration.

5.2 Briefly describe the soil analytical sampling and handling procedures used.

Soil samples collected from the excavation were collected utilizing hand and/or mechanical excavation equipment to gather the sample from at least 6-inches below/within the surface of the excavation.

Upon collection of each sample, a portion was immediately placed in a laboratory provided container, labeled and set on ice for transport to an independent laboratory for quantification of total petroleum hydrocarbons (TPH), benzene, toluene, ethylbenzene and total xylenes (BTEX) and chloride concentrations.

5.3 Discuss sample locations and provide rationale for their locations.

On March 14, 2006, soil samples were collected from a background location, two sample locations within the excavation and excavated, stockpiled soil for field analyses. Soil sample locations were chosen to provide the best representative example of soil within the excavation sidewalls.

After further excavation, soil samples were collected on March 16, 2006 from the two locations in the north excavation floor [NBH-1(8") and NBH-2 (6")] and four locations in the south excavation floor [SBH-1(12"), SBH-2(12"), SBH-3(6") and SBH-4(6")] for field and laboratory analyses (reference *Figure 5*). Soil sample locations were chosen to provide the best representative example of soil within the excavation floor.

6.0 ANALYTICAL RESULTS

6.1 Describe the vertical and horizontal extent and magnitude of soil contamination.

Field analyses of soil samples collected on March 14, 2006 from the excavation floor at one-foot bgs indicated organic vapor concentrations ranged from 22.6 to 37.6 parts per million (ppm). Chloride concentrations in the excavation floor samples were reported to range from 320 to 1,600 mg/Kg and the excavated, stockpiled soil were 640 mg/Kg. Field chloride analyses of the background sample indicated a concentration of 240 mg/Kg (reference *Table 2*).

Laboratory analyses of soil samples collected on March 16, 2006 from the excavation floor indicated TPH and BTEX constituent concentrations were ND at or above laboratory MDL. Reported chloride concentrations ranged from 47 to 749 mg/Kg (reference *Table 2, Figure 5* and *Appendix I*).

6.2 Is surface soil contamination present at the site (i.e., soil in the uppermost two feet that is visibly stained, contaminated at greater than 10 ppm (PID) or hydrocarbon saturated)?

🗌 yes 🛛 🖾 no

If yes, attach a site map identifying extent(s) of surface soil contamination.

Visibly stained soil has been excavated and transported to Sundance Services, Inc. for disposal. Field and laboratory analyses indicate hydrocarbon impacted soil has been excavated from the release area. Chloride impacted soil above the NMWQCC groundwater standard remains in the excavation floor.

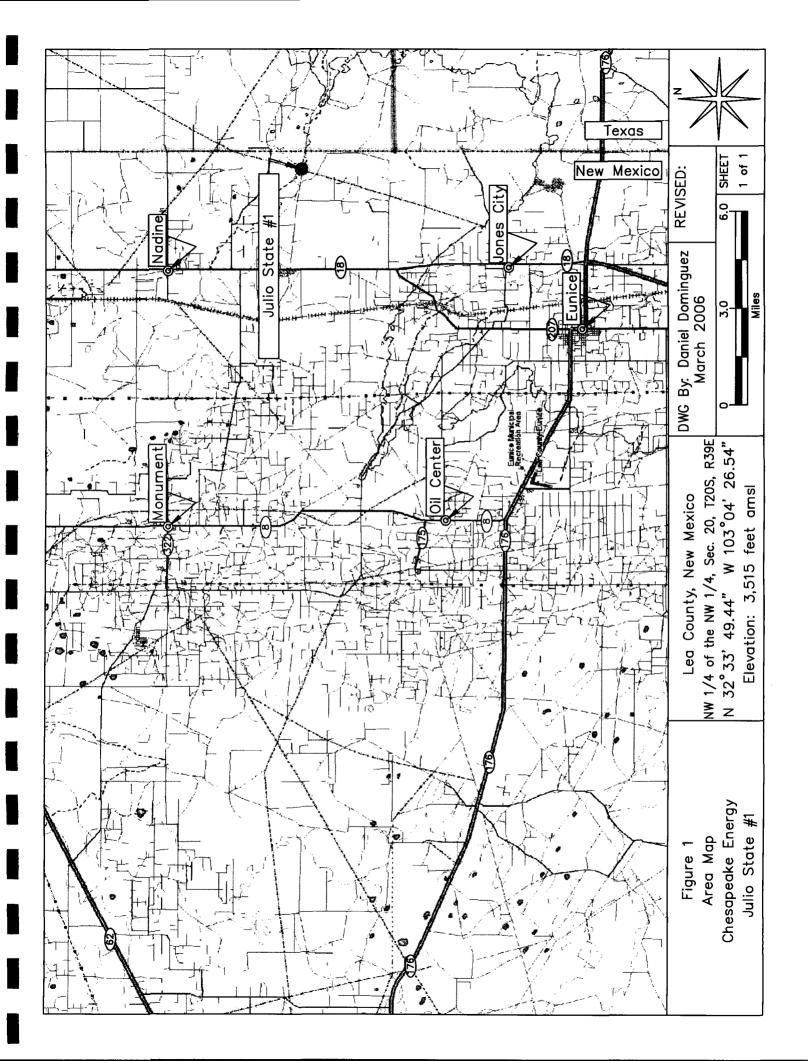

7.0 <u>DISCUSSION</u>

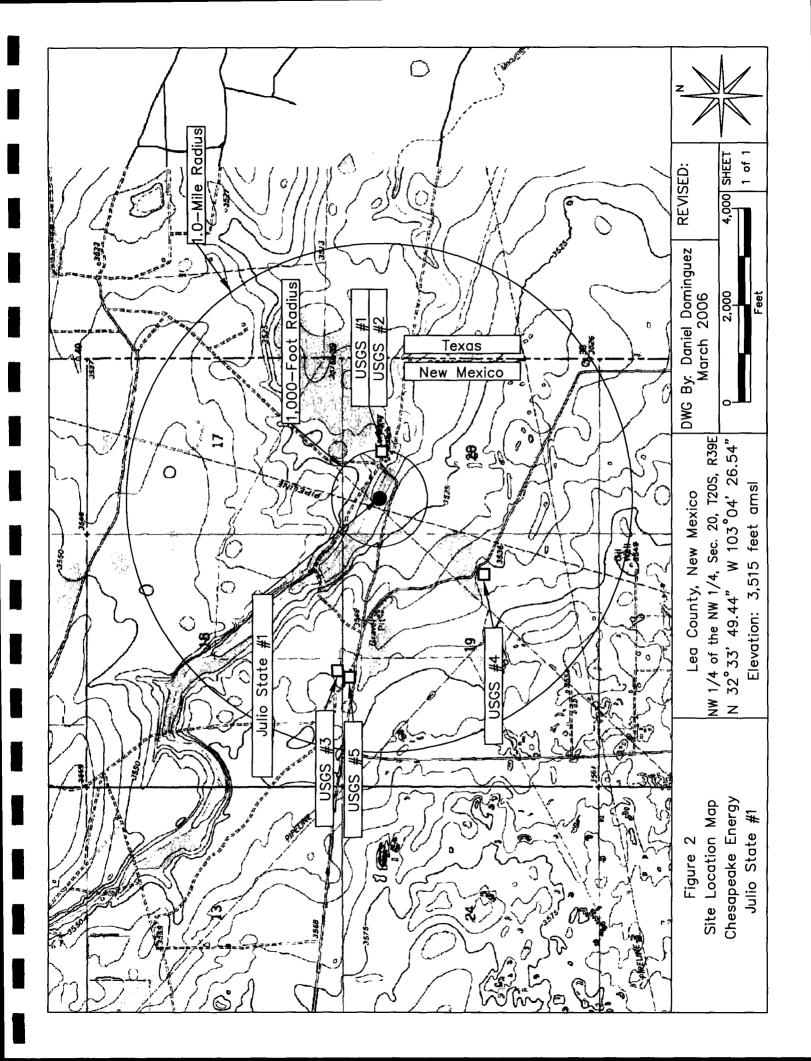

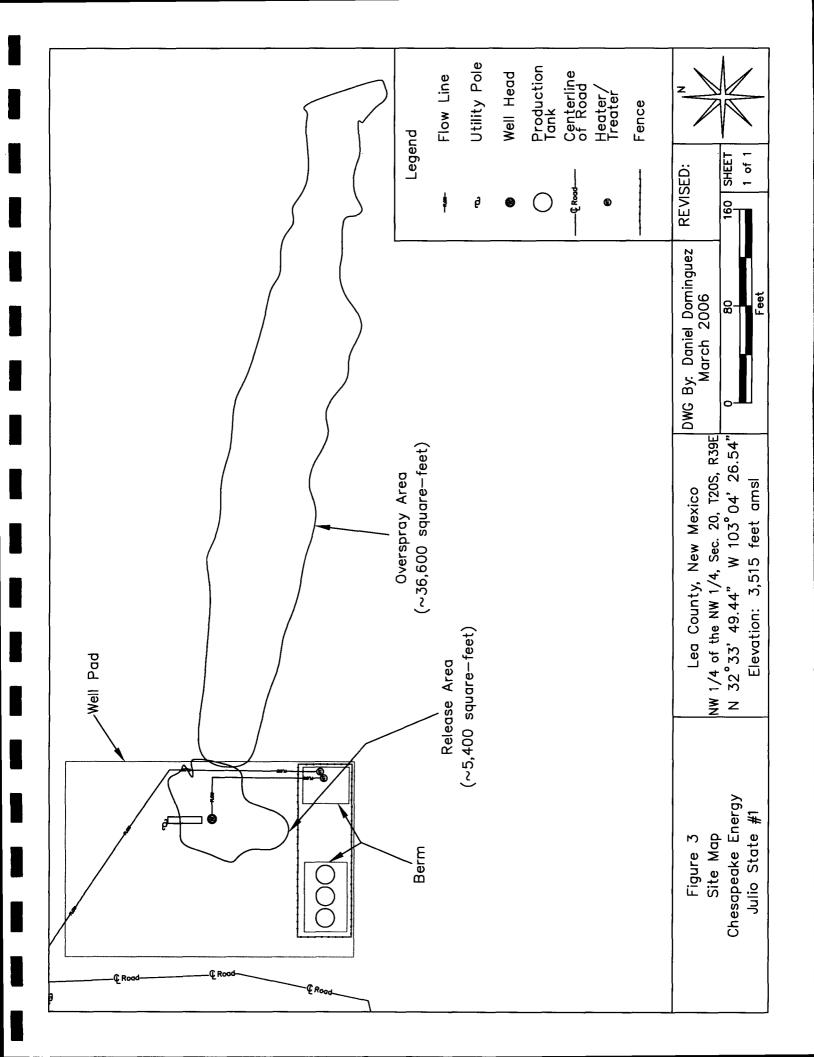

Based on depth to groundwater (approximately 40-ft bgs), chloride impacted soil above the NMWQCC groundwater standards should not be capable of impacting local groundwater.

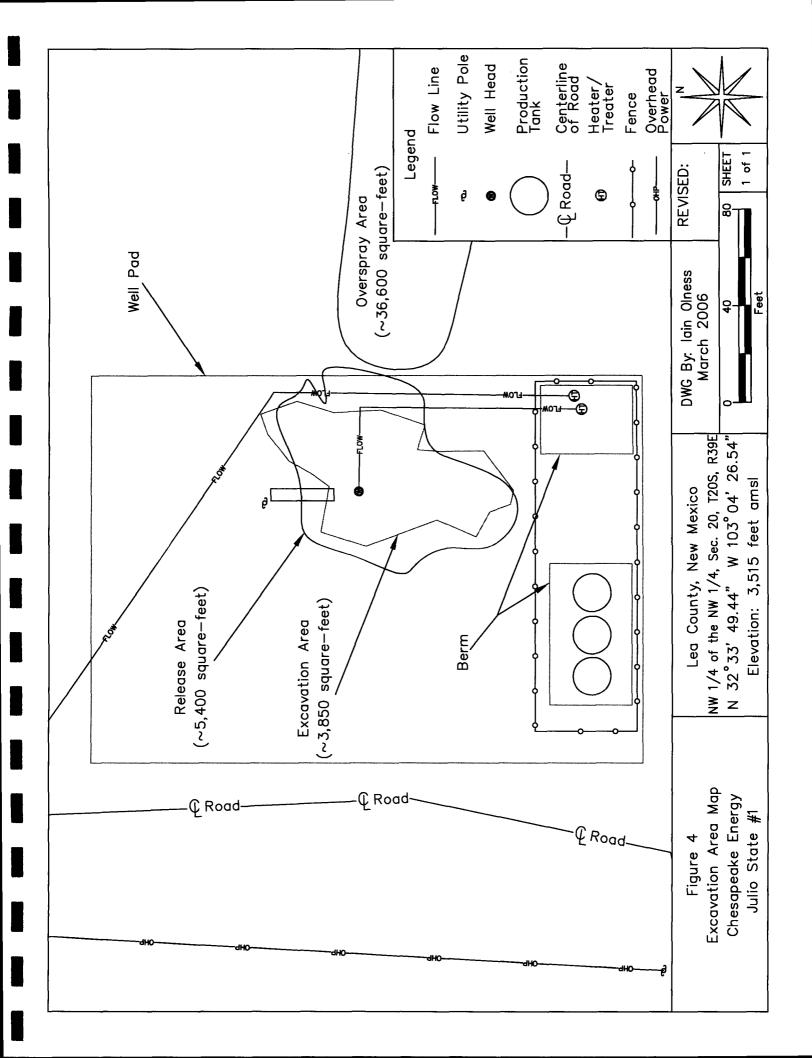

- 7.2 Discuss the risks associated with the impacted groundwater: Not Applicable
- 7.3 Discuss other concerns not mentioned above: The overspray area from the initial release consisted of an area of approximately 36,000-square feet. A treatment of 60 gallons of a 6% solution of Microblaze (i.e., a commercial solution of petrophillic microbes) was applied to the overspray area to mitigate any hydrocarbon impacts. Additionally, a sheen of oil was detected on a nearby stock pond. An absorbent boom was utilized to collect the oil from the water surface.

Regarding:

Environmental Plus, Incorporated	Project: Chesapeake/ Julio State #1	Fax: 505-394-2601
P.O. Box 1558	Project Number: 160052	Reported:
Eunice NM, 88231	Project Manager: Iain Olness	03/20/06 13:00

Notes and Definitions

J Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).

- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- LCS Laboratory Control Spike
- MS Matrix Spike
- Dup Duplicate

Report Approved By:

Raland K Just

3/20/2006

Raland K. Tuttle, Lab Manager Celey D. Keene, Lab Director, Org. Tech Director Peggy Allen, QA Officer Jeanne Mc Murrey, Inorg. Tech Director LaTasha Cornish, Chemist Sandra Sanchez, Lab Tech.
