RE: OCD Araho Facility

Order No.: 0505007

Dear Joseph Tracy:

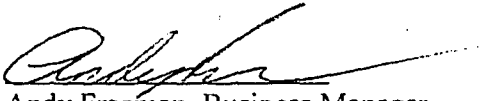

Hall Environmental Analysis Laboratory received 2 samples on 5/2/2005 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

RE: OCD Araho Facility

Order No.: 0505139

Dear Joseph Tracy:

Hall Environmental Analysis Laboratory received 6 samples on 5/16/2005 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

RE: Araho

Order No.: 0506292

Dear Sean Grossetete:

Hall Environmental Analysis Laboratory received 2 samples on 6/30/2005 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Cap Design Specifications

**Procedure for Excavation of Chlorides Contaminated Soil
and
Backfilling/Capping Excavation
Araho Former Oilfield Production Water Disposal Facility**

1.0 GENERAL

Contactors shall perform site work, including excavation, removal, and disposal of chlorides-contaminated soil and backfilling in accordance with the procedures described in the following sections.

Contractor shall be responsible for Health and Safety for the site, complying with all applicable federal, state, and local regulations, including compliance with OSHA trench safety regulations.

Contractor shall be responsible for protecting the environment during excavation, backfilling, transportation, and disposal operations at the Araho site. Contractor shall comply with all applicable federal, state, and local environmental regulations. INTERA has submitted a Notice of Intent (NOI) to comply with New Mexico General Permit No. NMR150000, and has completed a Storm Water Pollution Prevention Plan (SWPPP). Contractor shall comply with all Best Management Practices (BMPs) included in the SWPPP.

Contractor is responsible for means and methods for completion of the site work. This document is intended to be a description of the requirements for the site work, and is not intended to convey means and methods.

2.0 DESCRIPTION OF SITE WORK

Site work includes excavation, removal, and disposal of chlorides-contaminated soil to a depth of 10 feet below ground surface, installation, compaction, and grading of a one-foot clay cap at the base of the excavation; backfilling and compaction with local fill proposed by the contractor; and installation, compaction and grading of a one-foot caliche surface cap.

2.1 Excavation

Contactors are responsible for verifying that the site is free of subsurface structures, including subsurface utilities and/or piping prior to beginning excavation. Contractor is similarly responsible for protecting any overhead utilities, fencing, and existing monitoring wells during site activities.

Contractor shall excavate chlorides-contaminated soil from the area shown on Plan Drawing 01 to a depth of not less than 10 feet below ground surface (bgs) and not greater than 11 feet bgs. The area shown on Drawing 01 represents the base of the

excavation. Sides of the excavation shall be benched, sloped, or shored as required to maintain stability and comply with health and safety regulations. Upon completion of the excavation, measurements shall be made to ensure that a minimum of 10 feet of material have been removed.

The base of the excavation shall be graded so that there is a crown running along the approximate center of the excavation with an approximate 4% grade to the edge of the excavation. The depth of the crown shall be 10 feet bgs. The proposed grade of the base of the excavation is shown on the typical cross section provided on Drawing 02.

Excavated material shall be loaded onto appropriate trucks and transported to a disposal facility. A proper manifest and/or bill of lading shall be maintained for each truck load of disposed material and imported fill, and the final, signed manifests/bills of lading shall be provided to the Engineer once disposal operations have been completed.

2.2 Preparation for Backfill

Once the targeted soil has been removed from the excavation to the specified depth of 10 feet, the bottom of the excavation will be worked to provide the required grade for the clay cap. Native soil will be excavated from the edges of the bottom of the excavation and moved to the center of the excavation to achieve a 4% grade (see Drawing 02). The height of the crown at the center of the excavated area and the depth of material removed from the side to achieve grade will be variable and dependent on the width of the excavation. The crown shall have a degree of curvature no less than 3 degrees. The Contractor shall perform standard proctor test on the native material in accordance with ASTM method D698-00ae1. The worked soil shall be compacted to 95% ($\pm 3\%$) of the standard proctor with moisture content of $\pm 2\%$ of optimum. The grade, degree of compaction, and surface completion shall be approved by the INTERA representative prior to placing the clay cap.

2.3 Installation of 1-foot Clay Cap

A 1-foot clay layer shall be placed at the base of the excavation. The clay layer shall have a permeability of not greater than 10^{-7} cm/sec at the designated compaction and moisture. Contractor shall perform a standard proctor test on the proposed clay cap material in accordance with ASTM method D698-00ae1, and provide the results to the Engineer prior to delivery and placement of the clay.

The clay cap shall be installed in two six-inch final thickness lifts (approximately 8-inch loose lifts) and compacted to no less than 93% and no more than 98% standard proctor with a moisture content of -1 to +2 of optimum. Contractor shall confirm that compaction has been reached by conducting two compaction tests using ASTM method D2922-04, Standard Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth). One test shall be performed in the area of the north "panhandle" (Drawing 01) and the other test shall be completed in the area of the

southern portion of the excavation. Exact locations will be determined by the Engineer's on-site representative at the time of the tests.

While placing the second lift of the clay cap, the Contractor shall maintain grade control to ensure that the final grade meets the requirements. The final grade of the clay cap shall match the final grade base of the excavation, with a crown in the center and an approximate 4% grade to the edges of the excavation. A typical cross section of the excavation showing the backfill is shown on Drawing 02.

2.4 Backfilling and Compaction of Fill Material

Once the clay cap has been installed, the Contractor shall place approximately 7 to 11 feet of locally obtained fill material. According to information supplied by the Contractor, the fill material they are proposing consists primarily of fine sand with 16% fines. The Contractor shall supply to the Engineer the results of ASTM test methods D698-00ae1 and D422-63(2002), Standard Test Method for Particle-Size Analysis of Soils prior to delivery and placement of the fill material. The fill material shall be placed in one-foot loose lifts and each lift shall be compacted to no less than 90% standard proctor at a moisture content of $\pm 2\%$ of optimum. The Contractor shall ensure that compaction is reached by conducting two compaction tests per lift using ASTM test method D2922-04 at the locations described in Section 2.2. A typical cross section of the excavation showing the backfill is shown on Drawing 02.

2.5 Installation of 1-foot Caliche Cap

Once the fill material has been placed, a caliche cap shall be installed in the last one-foot of the excavation. The caliche shall be poorly sorted with coarse, medium, and fine fractions to produce an armored wearing surface over the excavation. The Contractor shall supply results of ASTM test methods D698-00ae1 and a sample of the caliche to the Engineer at least 1 week prior to delivery of the material. The caliche shall not be delivered to the site until the Engineer approves the material.

The one-foot caliche cap shall be placed in either a single one-foot compacted lift or two 6-inch compacted lifts with final compactions not less than 90% and not greater than 97% of standard proctor with moisture level of $\pm 2\%$ of optimum. The Contractor shall ensure that compaction criteria have been met by conducting two compaction tests using ASTM test method D2922-04 at the locations described in Section 2.2.

2.6 Final Grade

The final grade shall match the grade shown on Drawing 01. The Contractor shall be responsible for grade control during placement of the final lift. The Contractor shall supply a final elevation survey to the Engineer to ensure that the final grade has been met. Field fitting to achieve final grade will be coordinated with the Engineer's on-site representative.

3.0 WASTE MANAGEMENT

The Contractor is responsible for managing the waste generated during the project in accordance with all federal, state and local statutes and/or regulations. Waste at the site potentially consists of incidental trash, waste oil from routine equipment maintenance, contaminated soil from fuel or oil spills, and chlorides-contaminated soil.

Incidental trash shall be kept in appropriate containers and disposed of at an approved landfill.

Contractor shall perform routine equipment maintenance in such a way that petroleum product/waste spills are prevented or minimized, including using secondary containment as is needed and/or practical. Should a spill occur, the Contractor shall notify the Engineer in a timely manner (meaning the same day), and place the contaminated soil in an appropriate container as soon as is practical. Contractor is responsible for all removal actions from spills that happen during the completion of the site work, and shall be responsible for transportation and disposal of contaminated soil.

Contractor is responsible for means and methods for storage, transportation, and disposal of the excavated chlorides-contaminated soil. The Contractor shall provide the means and methods to the Engineer prior to starting work. Excavation and transport of the contaminated soil shall be performed in such a way to prevent spills outside of the boundaries of the excavation. Excavation and transport methods shall be carried out in a manner that is protective of the environment. During offsite transport to the approved disposal facility, the Contractor shall be responsible for following all federal, state, and local regulations regarding the transport and disposal of waste. Specifically, the Contractor shall be responsible for following all New Mexico Department of Transportation regulations regarding truck weight, freeboard, and tarps. All truck loads of contaminated soil shall be appropriately manifested and inspected prior to leaving the site. Signed manifests and/or bills of lading shall be supplied to the Engineer once the truck has reached the disposal facility and the waste has been accepted.

4.0 SUBMITTALS

Submittals that are required from the Contractor are:

- Test results for clay cap (Proctor, gradation, Atterberg Limits, Permeability, and compaction verification testing)
- Test results for fill material (Proctor, gradation, Atterberg Limits [if appropriate], and compaction verification testing)
- Test results for caliche (Proctor, gradation, Atterberg Limits [if appropriate], and compaction verification testing)
- Sample of caliche (>5 kg)
- Signed manifests for all loads of contaminated soil that left the site
- Final elevation survey

5.0 PROJECT CLOSEOUT

The project closeout shall consist of delivery of all Contractor submittals to the Engineer. The Engineer shall conduct a final site walk once the Contractor notifies the Engineer that Site work is complete. The Engineer shall make a punch list of deficient items, if any, and the Contractor shall complete those items prior to demobilization from the site. The Contractor shall leave the site in the condition it was found, at a minimum. The Contractor shall police the grounds and remove any incidental trash prior to final demobilization.
