RE: 2nd Quarter 2009 Groundwater Monitoring Results
Hobbs Booster Station, Lea County New Mexico (GW-044)
Unit C and D, Section 4, Township 19 South, Range 38 East

Dear Mr. Lowe:

DCP Midstream, LP (DCP), is pleased to submit for your review, a one copy of the 2nd Quarter 2009 Groundwater Monitoring Report for the DCP Hobbs Booster Station located in Hobbs, New Mexico (Unit C and D Section 4, T19S, R38E (32.696 degrees North, 103.156 degrees West)

If you have any questions regarding the report, please call me at 303-605-1718 or email me at swweathers@dcpmidstream.com

Sincerely

DCP Midstream, LP

Subject: Discharge Plan **GW-044**: Summary of Second Quarter 2009 Groundwater Monitoring Results for the Hobbs Booster Station: Hobbs, New Mexico
Units C and D Section 4, T 19 S, R 38 E, NMPM

Dear Steve:

This letter summarizes the second quarter 2009 groundwater-sampling event completed on May 26, 2009 at the DCP Midstream, LP Hobbs Booster Station in Hobbs, New Mexico. The facility is located in New Mexico Oil Conservation Division (OCD) designated units C and D of Section 4, Township 19 South, Range 38 East (Figure 1). The coordinates are 32.696 degrees north, 103.156 degrees west. The current well locations are shown on Figure 2. Construction and well use information is included in Table 1. Well uses include:

- Fluid level measurement and quarterly groundwater monitoring;
- Fluid level measurement and free phase hydrocarbon (FPH) recovery; and
- Fluid level measurement only.

Eleven additional wells, PW-AA through PW-KK, were installed as part of the FPH recovery system (Figure 2). They are not included in the monitoring program. These wells are checked periodically to ensure that the FPH recovery pumps are properly set.

A vacuum component was added to the FPH collection system in March 2008 to increase product recovery and extend the capture zones for the wells. The upgraded FPH collection system became fully operational in May 2008. The vacuum enhancement system generally runs between 40 and 50 inches of water.

There is also an air-sparge system (AS) that was installed along the south-central site boundary (Figure 2). This system injects air at pressures between 9 and 10 pounds per square inch (psi).

MONITORING ACTIVITIES AND GROUNDWATER FLOW

The monitoring activities were completed using the protocols for this site. The corrected groundwater elevations are shown on Table 2. A summary of all corrected water table elevation data is attached.

The 2-inch diameter wells that are attached to the FPH collection system were not gauged to minimize the potential for disruption. There are sufficient neighboring 4-inch wells that provide data to adequately characterize the water table configuration.

The water-table elevations for the wells containing free product were adjusted using the following formula:

$GWE_{corr} = MGWE + (PT*PD)$: where

- MGWE is the actual measured groundwater elevation;
- PT is the measured free-phase hydrocarbon thickness; and
- PD is the free phase hydrocarbon density (assumed 0.74 or 0.82 depending upon the well location).

Figure 3 shows hydrographs for select wells. The wells that were selected included:

- MW-7: Upgradient (west) of the site
- MW-14: Crossgradient on the southern property boundary
- MW-20: On the downgradient (east) property boundary
- TW-B: Attached to the western part of the FPH recovery system
- TW-D: Attached to eastern part of the FPH recovery system
- TW-Q: Immediately upgradient of FPH recovery system

These wells were evaluated as indicators for the potential effects of vacuum enhancement and air sparging. The water table declined in all wells except TW-D and TW-Q where it remained essentially constant. The water-table elevation in TW-D has remained constant since the fourth quarter of 2004: the time that the FPH collection system was installed. This stability may be related to the installation of that system.

A water-table contour map generated from the May 2009 corrected values using the program Surfer® with its kriging option is included as Figure 4. Groundwater flow beneath the site is eastward in the eastern half of the site. The regional water table has been modified from its natural configuration by the construction and operation of the FPH collection system. The effects continue to decline over time.

FPH RECOVERY

The vacuumed-enhanced FPH recovery system has been fully operational since early May 2008. Figure 5 graphs cumulative FPH removal. The FPH removal rate has remained essentially constant since the system was installed demonstrating its continued effectiveness.

GROUNDWATER CHEMISTRY

Samples were collected from down-gradient wells MW-19, MW-19d, MW-20, MW-21, MW-22, well MW-14 located on the southern property line, and southern boundary wells MW-15, MW-16, MW-23, MW-24 and MW-25. Each well was purged using a dedicated bailer until a minimum of three casing volumes of water was removed and the field parameters temperature, pH and conductivity stabilized. The well purging forms are attached. The affected purge water was disposed of at the DCP Linam Ranch facility.

Samples were collected from each well following field parameter stabilization using the dedicated bailers. All samples were placed in an ice-filled chest immediately upon collection and shipped to AccuTest laboratory using standard chain-of-custody protocols. The samples were analyzed for benzene, toluene, ethylbenzene and total xylenes (BTEX). A copy of the laboratory analytical report is attached.

The quality assurance/quality control evaluations included:

1. The adjusted sample cooler temperature was listed as 2.0 degrees.
2. None of the surrogate recoveries completed on the individual analyses were outside of their control limits;
3. The laboratory method blank and blank spikes were in their respective control ranges.
4. The matrix spike and matrix spike duplicates from MW-14, and MW-25 did not exceed their respective control limits. The matrix spike results for toluene and xylenes and the matrix spike duplicate value for xylenes were outside the control limits for MW-20.
5. The trip blank did not contain any BTEX; and
6. The relative percentage difference values for benzene and toluene from primary and duplicate samples were less than three percent. Ethylbenzene and xylenes were not detected.

The above evaluations establish that the data are suitable for their intended purposes.

The BTEX results are summarized in Table 3. The constituents that exceed the New Mexico Water Quality Control Commission Groundwater (NMWQCC) Standards highlighted as bold text. Benzene in MW-14 was the only constituent that exceeded the standards. There were no exceedances in the eastern down-gradient or southern boundary wells.

The benzene concentrations for the samples collected during this monitoring event are posted on Figure 6. The benzene concentration in MW-23 is below the method quatitation limit even though it is only 50 feet from MW-14. This relationship demonstrates that the BTEX concentrations are not above the NMWQCC Standards at any off-site locations.

Summary tables of all of the groundwater monitoring results are attached. Figure 7 graphs the time-benzene concentrations for the south boundary well MW-14. The benzene concentration in MW-14 declined substantially for the fourth straight monitoring event.

Based upon the data collected, AEC does not recommend any changes to the monitoring program, the FPH collection activities or the AS system over the next quarter. The FPH recovery and AS systems will continue to be checked at least weekly. The pumps in the system are generally set monthly to ensure that they are properly positioned.

The next groundwater-monitoring episode is scheduled for the third quarter of 2009. Do not hesitate to contact me if you have any questions or comments on this report or any other aspects of the projects.

Sincerely,
AMERICAN ENVIRONMENTAL CONSULTING, LLC

WELL SAMPLING DATA FORM

CLIENT: DCP Midstream WELL ID: **MW-25**

SITE NAME: Hobbs Booster Station DATE: 5/26/2009

PROJECT NO. NA SAMPLER: Stewart/Taylor

PURGING METHOD: ☑ Hand Bailed ☐ Pump If Pump, Type: _____

SAMPLING METHOD: ☑ Disposable Bailer ☐ Direct from Discharge Hose ☐ Other: _____

DESCRIBE EQUIPMENT DECONTAMINATION METHOD BEFORE SAMPLING THE WELL:

☑ Gloves ☐ Alconox ☐ Distilled Water Rinse ☐ Other: _____

TOTAL DEPTH OF WELL: 55.00 Feet

DEPTH TO WATER: 45.73 Feet

HEIGHT OF WATER COLUMN: 9.27 Feet

WELL DIAMETER: 2.0 Inch

4.5 Minimum Gallons to purge 3 well volumes (Water Column Height x 0.49)

TIME	VOLUME PURGED	TEMP. °C	COND. *m* S/cm	pH	DO mg\L	Turb	PHYSICAL APPEARANCE AND REMARKS
