Subject: RE: Soil Samples - Murchison Oil Lease
Attachments: Field Sketch with FID Readings.pdf

Mike,

Per our phone conversation, I am submitting the Flame Ionization Detector readings on headspace samples collected at the referenced site. These readings were pulled on a different set of samples collected at the same locations as those collected for laboratory analysis. The FID readings are all below 100 ppm and most were below 25 ppm. As discussed, we will analyze the samples collected at 6 inches for both TPH and BTEX.

Once we receive the lab reports we will provide to NM OCD for evaluation.

Let me know if you need further information at this time.

Regards,

Victor Ayala
