Lea State 946 Enhanced Oil Recovery Project

Executive Summary

A detailed reservoir engineering evaluation of the Abo reservoir in the Lea State 946 Field in Lea County, New Mexico was made using geologic maps, log analyses, well tests, core data, workover reports and performance data. Based on this data a mathematical model has been developed. Oil recoveries were calculated under current operation and under water injection.

The model study concludes the following:

- Converting well Lea State 946 #1 well to water injection into the Abo zone improves total oil recovered from the Lea State 946 lease that benefits the Owners and State Lands of New Mexico
- The model predicts that converting Lea State 946 well #1 to injection will increase total field oil recovery by 60,200 bbls.
- Lea State 946 #1 well is in the best structural position for water injection as it is the most downdip well amongst the four producing wells in the lease
- The model predicts that remaining oil on the lease will be pushed from the Lea State 946 #1 well towards the three updip producing wells on the lease which are all located on State Lands of New Mexico thereby improving oil recovery.
- The well LEE #1 (operated by Occidental Petroleum), located about ½ mile East from the proposed injection well on private lands, produces from the Bone Springs zone and is separate and isolated from the Abo zone.

Simulation Model of Lea State 946

- A three-dimensional, three-phase reservoir simulation model of the Lea State 946 field was created to predict the benefits of converting Well #1 to injection in the Lea State 946 lease
- Existing structural and net thickness maps, logs, fluid properties, DST tests and production history was used to construct and calibrate model
- The simulation model was used to predict the oil recovery from converting Well #1 to injection and comparing this to the oil recovered from the base case of continuing current operations (i.e. produce all four wells and sending water to third party disposal).

Results from Simulation Model

- Converting Well #1 to injection and injecting at a rate of 300 bwpd, model predicts additional oil recovery of 60,200 bbls
- Source of 300 bwpd injection rate is from total field produced water; model predicts that adding make up water to system will yield additional oil recovery
- Well #1 is in best structural position for injection well because it is located downdip in reservoir

Project Timeline and Costs

- Project Timeline: 2 weeks
- Total Project Costs: \$62,000
 - Arrow Set Packer: \$3000
 - Plastic Coated Tubing (inj well): \$22,500
 - Plastic Coated Tubing (injection line): \$5000
 - Rig Work: \$8000
 - Triplex Pump: \$15,000
 - Master Valve, Check Valves: \$5000
 - Roustabout: \$3000

Diagram of Surface Injection Facility

*All tanks are monitored by Tank-Link monitor and sends readings via internet to operator

Predicted Response from Converting Lea State 946 #1 Well to Injection
(Injection Rate limited to field water production - IWR = 1.0)
