

## 2. Recommendations

The following recommendations are presented for consideration and discussion:

1. Continue to drill future laterals in this area in the current orientation of north-south. Though the primary project azimuth of N70°E to N80°E is somewhat oblique to the current lateral orientation, land restrictions limiting lateral direction to either north-south or east-west necessitates a choice between the two options. Given these restrictions, a north-south orientation results in the most exposed reservoir surface area/bbl of fracturing fluid pumped.
