## Colorado Infill Drilling Results

- Actual results from 20 sections next to New Mexico
- No detrimental interference with parent wells performance
- Significantly higher pressure encountered at the infill well than parent well
- Infill gas reserves are mostly incremental, not rate acceleration
- Similar infill results expected in New Mexico

# CO/NM Border Fruitland Coal Infill Results

# Infill Reserves vs. Offset Gas Rate

- Infill incremental reserves range from 1 bcf to 6 bcf
- Average 2 bcf incremental reserves per infill well
- Potential NM infill reserves in high productivity area:
  - 194 wells  $\times$  2 bcf per well = 388 bcf
