

5b. In this area, water for stock use generally can be obtained from wells in limestone, gypsum, or rebeds of the Rustler formation at depths as great as 250 feet. Water is generally too high in chloride and sulfate for domestic use and locally is undesirable even for livestock.

5c. In this area, water for stock and domestic use generally can be obtained from wells in the Triassic rebeds at depths up to 300 feet. Water is generally of fair quality but locally is impotable.

5d. In this small area of the High Plains, potable water for stock and domestic use can be obtained from wells in sand and gravel or from underlying rebeds at a depth of about 300 feet.
