

7/24/81

Joe: What do you want to do about this fiasco? It took the threats of force-plugging hearings (3 times) to get the well completed. When Dawell acidized - after newspapers & radio put out the info. that well was a 100 bbl/day oil discovery - they had already used 420 ball sealers when I left location. (Later I learned that Dawell had filed lawsuit to collect their money for job.)

Last report shows TA permit expired 1-15-81. I can't legally give more time, and have not been able to reach "Gary Andy" in last few weeks, by telephone.

Attached are pictures of well site I took last Wed. No explanation. Gauge on well-head climbs to about 10 or 12 psi when gate valve is opened.

Carl

JDR. Saw it as SI CO₂ well 9/4/81
