

2016 ANNUAL GROUNDWATER REPORT

Johnston Fed #4
NMOCD Case #: 3RP-201-0
Meter Code: 70194
T31N, R09W, Sec 33, Unit H

SITE DETAILS

Site Location: Latitude: 36.862800 N, Longitude: -107.771983 W
Land Type: Private/Fee
Operator: Burlington Resources

SITE BACKGROUND

- **Site Assessment:** 8/94
- **Excavation:** 9/94 (60 cy)

Environmental Remediation activities at the Johnston Fed #4 (Site) are managed pursuant to the procedures set forth in the document entitled, “Remediation Plan for Groundwater Encountered during Pit Closure Activities” (Remediation Plan, El Paso Natural Gas Company / El Paso Field Services Company, 1995). This Remediation Plan was conditionally approved by the New Mexico Oil Conservation Division (OCD) in correspondence dated November 30, 1995; and the OCD approval conditions were adopted into El Paso CGP Company (EPCGP’s) program methods. Currently, the Site is operated by Burlington Resources Oil & Gas Company LP and is active.

The Site is located on Private/Fee land. Various site investigations have occurred since 1994. Monitoring wells were installed in 1995 (MW-1, MW-2, MW-3), 2006 (MW-4, TMW-5), 2013 (MW-6 through MW-12), and 2014 (MW-13 through MW-20). Temporary piezometers PH-PZ-1, PH-PZ-2, and PH-PZ-3 were installed and abandoned in 1997. Temporary monitoring well TMW-5 was plugged and abandoned in 2014. Free product has been observed at the site and is periodically recovered. In 2016, measureable free product was observed in MW-1, MW-3, MW-6, MW-8, and MW-11. Currently, groundwater sampling is conducted from selected monitoring wells on a semi-annual basis.

GROUNDWATER SAMPLING ACTIVITIES

Groundwater monitoring and sampling was completed on April 16 and October 12, 2016. Water levels were gauged at wells MW-1 through MW-4 and MW-6 through MW-20. Monitoring wells MW-6, MW-7, MW-9, MW-13, MW-15, MW-16, MW-18, MW-19 and MW-20 were selected to be sampled in 2016. Groundwater samples were not collected from MW-1, MW-3, MW-8, and MW-11 in 2016 due to the presence of free product. Groundwater samples were collected from selected monitoring wells using HydraSleeve™ (HydraSleeve) no-purge groundwater sampling devices. The HydraSleeves were set during the previous sampling event approximately 0.5 foot above termination depth of the monitoring wells using a suspension tether and stainless steel weights to collect a sample from the screened interval.

Groundwater samples were placed into laboratory-supplied sample containers, packed on ice, and shipped under standard chain-of-custody protocols to TestAmerica-Pensacola where they were analyzed for BTEX. Additional field parameters were collected from the excess sample water recovered by the HydraSleeve. Excess sample water was poured into a YSI multi-parameter instrument sample cup and analyzed. Field parameters include dissolved oxygen, temperature, conductivity, pH, and oxidation-reduction potential (ORP). Field parameters are not collected if free product is present. The unused sample water is combined in a waste container and taken to Basin Disposal, Inc. for disposal.

FREE PRODUCT RECOVERY

Free product was manually recovered from MW-1, MW-3, MW-8 and MW-11 in 2016. Approximately 0.2 gallons of free product were manually recovered from MW-1, approximately 1.44 gallons of free product were recovered from MW-3, approximately 4.63 gallons of free product were recovered from MW-8, and 0.79 gallons of free product were recovered from MW-11 in 2016. During the April 2016 recovery event, field specific gravity measurements of 0.745, 0.745, and 0.75, were recorded from the free product recovered from MW-3, MW-8, and MW-11, respectively, using a hydrometer. Based on the data collected, transmissivity estimates of 0.00029 to 0.17 ft²/ day were obtained using Bouwer and Rice, and Cooper, Bredehoeft, and Papadopoulos models.

Mobile dual phase extraction (MDPE) events were completed on November 30 and December 1, 2016, by AcuVac Remediation, LLC, of Houston, Texas (AcuVac). The purpose of the MDPE events was to evaluate more aggressive free product recovery methods from monitoring wells MW-3 and MW-8. MDPE is a process combining soil vapor extraction (SVE) with groundwater depression to enhance the removal of liquid and vapor phase hydrocarbons. A submersible pump is used to simultaneously remove dissolved-phase contaminated groundwater, inducing a hydraulic gradient toward the extraction well, and creating groundwater depression to expose the hydrocarbon smear zone to SVE. Recovered liquids were transferred to a portable storage tank for off-site disposal. Recovered vapors were used as fuel and burned in the MDPE internal combustion engine (ICE), resulting in little to no emissions. Power generated by the ICE is used to create the induced vacuum for SVE.

2016 ANNUAL GROUNDWATER REPORT

**Johnston Fed #4
NMOCD Case #: 3RP-201-0
Meter Code: 70194
T31N, R09W, Sec 33, Unit H**

Two, 8-hour MDPE events were completed, one using MW-1 as an extraction well, and a second using MW-8 as an extraction well. Based on field data collected by AcuVac, approximately 6.7 gallons of hydrocarbons were recovered from MW-3, and approximately 15.27 gallons of hydrocarbons were recovered from MW-8. AcuVac's report summarizing the MDPE events at the Site is presented as Appendix A. Recovered fluids from the MDPE event were transported to Basin Disposal Inc. for disposal. Waste disposal documentation is included as Appendix B.

In order to confirm hydrocarbon recovery during the MDPE events, a vapor sample was collected at the extraction wellhead during each MDPE event. The vapor samples were collected in laboratory-provided Summa canisters, and shipped under chain-of-custody protocols to TestAmerica Laboratories, Inc. in Burlington, Vermont. The vapor samples were analyzed for TPH and BTEX constituents. The analytical results were used to supplement the field measurements collected by Acuvac in order to calculate constituent-specific mass removal for each extraction well. Based on the vapor concentrations, 53 pounds of hydrocarbons as TPH were removed from MW-3, and 32 pounds of hydrocarbons as TPH were removed from MW-8. The mass removal calculation tables and laboratory reports are included as Appendix C.

SUMMARY TABLES

Historic groundwater analytical results and well gauging data are summarized in Tables 1 and 2, respectively. When free product was present, static water level elevations were corrected for measurable thicknesses of free product (specific gravity of 0.75). Monthly free product recovery data is summarized in Table 3.

SITE MAPS

Groundwater analytical results (Figures 1 and 3) and groundwater elevation contour maps (Figures 2 and 4) summarize results of the 2016 groundwater sampling and gauging events.

ANALYTICAL LAB REPORTS

The groundwater analytical lab reports are included as Appendix D.

GROUNDWATER RESULTS

- The groundwater flow direction at the Site is generally to the east-southeast (see Figures 2 and 4). The elevations at MW-12 remained anomalous, consistent with past results.
- Free product was observed in MW-1, MW-3, MW-8, and MW-11 in 2016. No samples were collected from these monitoring wells.

2016 ANNUAL GROUNDWATER REPORT

**Johnston Fed #4
NMOCD Case #: 3RP-201-0
Meter Code: 70194
T31N, R09W, Sec 33, Unit H**

- One or more groundwater samples collected in 2016 from MW-6, MW-9, and MW-16 exceeded the New Mexico Water Quality Control Commission (NMWQCC) standard (10 micrograms per liter [$\mu\text{g}/\text{L}$]) for benzene in groundwater. Groundwater samples from the remaining monitoring wells sampled in 2016 were either below the NMWQCC standard for benzene or not detected.
- Concentrations of toluene were either below the NMWQCC standard (750 $\mu\text{g}/\text{L}$) or not detected in the Site monitoring wells sampled in 2016.
- Concentrations of ethylbenzene were either below the NMWQCC standard (750 $\mu\text{g}/\text{L}$) or not detected in the Site monitoring wells sampled in 2016.
- Concentrations of total xylenes were either below the NMWQCC standard (620 $\mu\text{g}/\text{L}$) or not detected in the Site monitoring wells sampled in 2016.

PLANNED FUTURE ACTIVITIES

Groundwater monitoring events will be conducted on a semi-annual basis, utilizing a selection of site monitoring wells which provides an adequate representation of site conditions. Free product recovery will also continue in 2017. A work plan will be submitted to the NMOCD for additional activities, if planned, for 2017. The 2017 Annual Report will be submitted in early 2018.

Notes:

"µg/L" = micrograms per liter

Results highlighted yellow exceed their respective New Mexico Water Quality Control Commission (NMWQCC) standards.

"J" = Result is less than the reporting limit but greater than or equal to the method detection limit and the result is an approximate value.

"<" = analyte was not detected at the indicated reporting limit (some historic data were reported at the detection limit).

"NS" = Monitoring well not sampled

Mr. Stephen Varsa
Supervising Hydrogeologist
MWH Americas, Inc.
11153 Aurora Avenue
Des Moines, IA 50322

Dear Stephen:

Re: Johnston Federal No. 4, San Juan County, NM

At your request, we performed two Mobile Dual Phase Extraction (MDPE); Event #1A on well MW-8 on and Event #1B on well MW-3 at the above referenced site on November 30, 2016 and December 1, 2016, respectively. Following is the Report and a copy of the Operating Data collected during Event #1. Additionally, Table #1 contains the Summary Well Data and Table #2 contains the Summary Recovery Data.

The purpose of the MDPE events was to maximize recovery of Phase Separated Hydrocarbons (PSH). PSH is referred to as Non-Aqueous Phase Liquids (NAPL) which includes Light Non-Aqueous Phase Liquids (LNAPL). The source of the NAPL is an historical release of natural gas condensate.

OBJECTIVES

The Objectives of an MDPE event are to:

- Evaluate the potential for removing liquid and vapor phase NAPL from the groundwater (GW) and soils in the subsurface formations within the influence of the extraction well.
- Expose the capillary fringe area and below to the extraction well (EW) induced vacuums.
- Increase the groundwater and contaminant specific yields with high induced vacuums.
- Provide an induced hydraulic gradient (IHG) to gain hydraulic control of the area during the event period.
- Select the groundwater depression and pump rates to accomplish the above objectives.

METHODS AND EQUIPMENT

AcuVac owns and maintains an inventory of equipment to perform MDPE events. No third party equipment is utilized. The events at the above referenced site were conducted using the AcuVac I-6 System, with Roots RAI-33 blower used as a vacuum pump and Roots RAI-22 positive displacement blower. The following table lists equipment and instrumentation employed in these events and the data captured by each.

Data Element	Measurement Equipment
Extraction Well Vacuum	Dwyer Magnehelic Gauges
Extraction Well Vapor Flow	Dwyer Averaging Pitot Tubes / Magnehelic Gauges
Observation Wells Induced Vacuum	Dwyer Digital Manometer
Extraction Well Non-Diluted Vapor Samples	V-1 vacuum box
Extraction Well Vapor TPH Content	HORIBA® Analyzer Model Mexa 554GE
Extraction Well Vapor Oxygen Content	Lumidor MicroMax Pro O ₂ Monitor
Depth to NAPL and Depth to groundwater	Solinst Interface Probes Model 122
Liquid Flow and Total Volume	Blancett 1100 Turbine Flow Meter
Liquid Flow and Total Volume	Blancett B3000 Flow Monitor
Liquid Column in Extraction and Observation Wells	In-Situ Level Troll 700 Data Logger
Equalize Well Vacuum/Pressure	In-Situ Vented Cable with Chamber
Capture Readings from Data Logger Trolls	In-Situ Rugged Reader Data Logger Interface
In-Well Pump	Grundfos Redi-Flo 2 Total Fluids Pump
Pump Speed, Other Diagnostics	Grundfos/Baldor Electronic Pump Controller
Relative and Absolute Barometric Pressure	Testo Model 511

The vacuum extraction portion of the AcuVac System consists of a vacuum pump driven by an internal combustion (IC) engine. The vacuum pump is connected to the extraction well and the vacuum created on the extraction well causes light hydrocarbons in the soil and on the groundwater to volatilize and flow through a moisture knockout tank to the vacuum pump and the IC Engine where they are burned as part of the normal combustion process. Propane is used as auxiliary fuel to help power the engine if the well vapors do not provide the required energy.

The AcuVac IC Engine is fully loaded for the maximum power necessary to achieve and maintain high induced vacuums and/or high well vapor flows required to maximize the vacuum radius of influence (ROI) for pilot tests and short term event remediation.

Emissions from the engine are passed through three catalytic converters to ensure maximum destruction of removed hydrocarbon vapors. The engine's fuel to air ratio can be adjusted to maintain efficient combustion. Because the engine is the power source for all equipment, all systems stop when the engine stops. This eliminates any uncontrolled release of hydrocarbons. Since the AcuVac System is held entirely under vacuum, any leaks in the seals or connections are leaked into the System and not emitted into the atmosphere. The engine is automatically shut down by vacuum loss, low oil pressure, over speed or overheating.

Groundwater extraction is provided by an in-well, Redi-Flo 2 total fluids pump that has the discharge line connected to a total volume meter. The discharge line from the volume meter is then connected to the stand-by tank. The electrical power for the groundwater pump was supplied from a 120v Honda generator. The groundwater flow rate can be adjusted to maintain a target level. Interface meters are used to collect depth to groundwater and depth to NAPL measurements. Groundwater samples were taken periodically in a graduated cylinder to determine the average NAPL percentages and volume.

The design of the AcuVac System enables independent control of both the Induced well vacuum and the groundwater pumping functions such that the AcuVac team can control the IHG to increase exposure of the formation to SVE. The ability to separate the vacuum and liquid flows within the extraction well improves the NAPL recovery rates, and enables the AcuVac team to record data specific to each media.

SUMMARY OF MDPE EVENT #1A- WELL MW-8

- The total Event time was 7.5 hours. The Event was conducted on November 30, 2016. This was the first event completed from well MW-1, and therefore there was no comparative data from this well.
- The total liquid volume recovered was 798 gals, of which 0.26% or 2.10 gals were liquid NAPL.
- Based on the HORIBA® analytical data, total vapor NAPL burned as IC engine fuel was 13.17 gals, for a total liquid and vapor NAPL recovery of 15.27 gals, or 2.04 gals per hour.
- Average HORIBA® analytical data from the influent vapor samples was:
Total Petroleum Hydrocarbons (TPH) = 33,500 ppmv, Carbon dioxide (CO₂) = 4.70%, Carbon monoxide (CO) = 0.49%, Oxygen (O₂) = 9.0% and Hydrogen sulfide (H₂S) = 1 ppm.
- The maximum HORIBA® analytical data from the influent vapor samples for TPH was 35,760 ppmv.
- The average extraction well induced vacuum was 63.13 inches of water ("H₂O) with a maximum vacuum of 80.00" H₂O.
- The average extraction well vapor flow was 24.25 scfm with a maximum well vapor flow of 32.87 scfm.
- The groundwater pump inlet was initially set at 55.5 ft BTOC, or 1.0 ft above the well bottom of well MW-8. This position was based on the fact that the well was pumped dry when it was being produced after it was drilled. At 1300 hrs, the groundwater pump was relocated to 52.5 ft BTOC. This position placed the groundwater pump within 1.0 ft of the then hydro-equivalent. The average groundwater pump rate was 1.84 gpm, and the maximum groundwater pump rate was 2.80 gpm.
- The average groundwater depression, based on the positioning of the groundwater pump, was 1.5 ft below the hydro-equivalent static level.
- A NAPL thickness in well MW-8 of 0.60 ft was recorded prior to the start of Event #1A and no NAPL thickness was recorded at the conclusion of the Event #1A.

The total NAPL removed, including liquid and vapor, during the 7.5 hour Event #1A, Well MW-8, was 15.27 gals.

ADDITIONAL INFORMATION

- For the first 2.0 hours of the Event #1A, there was no groundwater pumping, and SVE only was conducted due to the frozen conditions at the site.
- The lower percentage of the NAPL volume, 2.10 gals or 13.75%, was recovered as liquid within minutes after the start of Event #1A. The NAPL was present in the well bore and most likely in the area immediately surrounding the well. No quantifiable liquid NAPL was recovered after the first 30 minutes of Event #1A.

- A higher percentage of the NAPL volume, 13.17 gals or 86.25%, was burned as IC engine fuel as a result of the TPH content in the influent vapors.
- Well MW-20 (31.11 ft from well MW-8), well MW-3 (36.11 ft from well MW-8) and well MW-10 (45.30 ft from well MW-8) were sealed with plugs designed to accept a digital manometer. During the course of Event #1A, the vacuum influence of the extraction well on the observation wells was measured with a digital manometer. Well MW-3 (average of 1.81" H_2O) was sufficiently influenced by the induced vacuum to the extent to be considered in the radius of influence. Well MW-10 (average of 0.15" H_2O) and MW-20 (average of 0.03" H_2O) were slightly influenced by the induced vacuum, but not to the extent to be considered in the radius of influence of extraction well MW-8.
- An approximation of the radius of influence may be obtained by determining the point at which the measured vacuum is 0.60 to 0.70" H_2O or approximately 1.0% of the average induced vacuum of 63.13" H_2O . It is assumed that beyond the lower point, the pressure gradient (driving force) is negligible to effectively transport vaporized contaminants to the extraction well. Under continuous operation, vacuum and radius of influence will most likely continue to increase horizontally and vertically.
- Data loggers were placed in the extraction well MW-8 and observation well MW-3 to determine the extent of the induced hydraulic gradient that was created by the groundwater pumping. The graphs of the data are included in Graph #1.

SUMMARY OF MDPE EVENT #1B- WELL MW-3

- The total Event time was 8.0 hours. The Event was conducted on December 1, 2016. This was the first event completed from well MW-1, and therefore there was no comparative data from this well.
- The total liquid volume recovered was 630 gals with no measureable liquid NAPL recovered.
- Based on the HORIBA® analytical data, total vapor NAPL burned as IC engine fuel was 6.70 gals, for a total liquid and vapor NAPL recovery of 6.70 gals, or 0.84 gals per hour.
- Average HORIBA® analytical data from the influent vapor samples was:
TPH = 26,676 ppmv, CO₂ = 6.86%, CO = 0.24%, O₂ = 7.4% and H₂S = 0 ppm.
- The maximum HORIBA® analytical data from the influent vapor samples for TPH was 27,210 ppmv.
- The Average extraction well induced vacuum was 62.35" H_2O with a maximum vacuum of 80.00" H_2O .
- The average extraction well vapor flow was 14.53 scfm with a maximum well vapor flow of 19.25 scfm.
- The groundwater pump inlet was initially set at approximately 66.0 ft BTOC, or 1.0 ft above the well bottom. This position was based on the assumption that the well may not produce a high volume of liquid. At 1000 hrs, the groundwater pump became clogged with bentonite from the well bottom. The pump was removed from the well, disassembled, cleaned and was relocated to approximately 53.0 ft BTOC. This position placed the groundwater pump within 1.0 ft of the then hydro-equivalent. The average groundwater pump rate for Event #1B was 1.41 gpm, and the maximum groundwater pump rate was 2.00 gpm.
- The average groundwater depression, based on the positioning of the groundwater pump, was 1.5 ft below the hydro-equivalent static level.

- A NAPL thickness of 0.21 ft in extraction well MW-3 was recorded prior to the start of Event #1B and no NAPL thickness was recorded in extraction well MW-3 at the conclusion of the Event #1B.

The total NAPL removed, including liquid and vapor, during the 8.0 hour Event #1B, Well MW-3, was 6.70 gals.

ADDITIONAL INFORMATION

- For the first 1.5 hours of the event, there was no groundwater pumping, and SVE only was conducted due to the frozen conditions at the site.
- No measurable liquid NAPL was recovered. All of the NAPL volume, 6.70 gals or 100.00%, was burned as IC engine fuel.
- Well MW-20 (31.11 ft from well MW-3), well MW-2 (31.5 ft from well MW-3), well MW-8 (36.11 ft from well MW-3) and well MW-10 (45.3 ft from well MW-3) were sealed with plugs designed to accept a digital manometers. During the course of Event #1B, the vacuum influence of the extraction well on the observation wells was measured with a digital manometer. All of the wells were slightly influenced by the induced vacuum in extraction well MW-3, but not to the extent to be considered in the radius of influence. MW-2- average of 0.07" H_2O , MW-20- average of 0.09" H_2O , MW-8- average of 0.53" H_2O , and MW-10-average of 0.02" H_2O .
- An approximation of the radius of influence may be obtained by determining the point at which the measured vacuum is 0.60 to 0.70" H_2O or approximately 1.0% of the average induced vacuum of 62.35" H_2O . It is assumed that beyond the lower point, the pressure gradient (driving force) is negligible to effectively transport vaporized contaminants to the extraction well. Under continuous operation, vacuum and radius of influence will most likely continue to increase horizontally and vertically.
- Data loggers were placed in the extraction well MW-3 and observation well MW-8 to determine the extent of the induced hydraulic gradient that was created by the groundwater pumping. The graphs of the data are included in Graph #2.

METHOD OF CALIBRATION AND CALCULATIONS

The HORIBA® Analytical instrument is calibrated with Hexane, CO and CO₂.

The formula used to calculate the emission rate is:

$$ER = HC \text{ (ppmv)} \times MW \text{ (Hexane)} \times \text{Flow Rate (scfm)} \times 1.58E^{-7} \frac{\text{(min)(lb mole)}}{\text{(hr)(ppmv)(ft}^3\text{)}} = \text{lbs/hr}$$

INFORMATION INCLUDED WITH REPORT

- Table #1 Summary Well Data
- Table #2 Summary Recovery Data
- Schedule A-1: Graphic Summary of Induced Hydraulic Gradient- Event #1A
- Schedule A-2: Graphic Summary of Induced Hydraulic Gradient- Event #1B
- Recorded Data
- Photographs of the MDPE System, well MW-3 and MW-8.

After you have reviewed the report and if you have any questions, please contact me. We appreciate you selecting AcuVac to provide this service.

Sincerely,
ACUVAC REMEDIATION, LLC

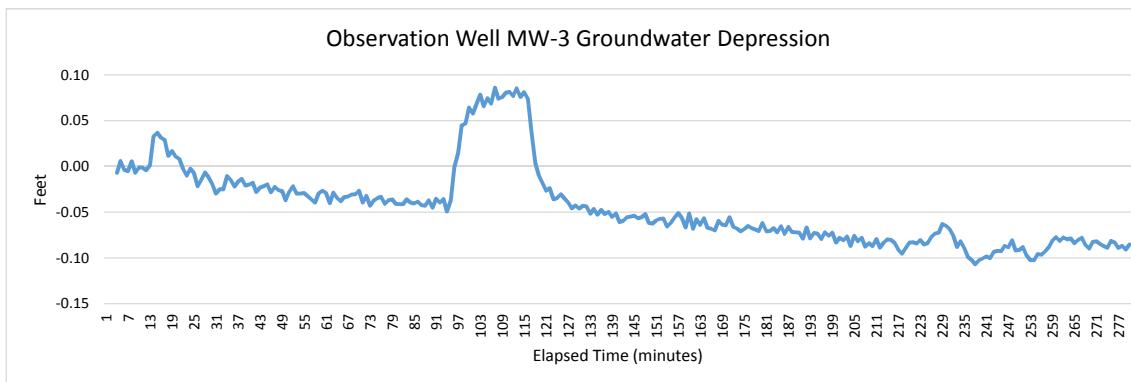

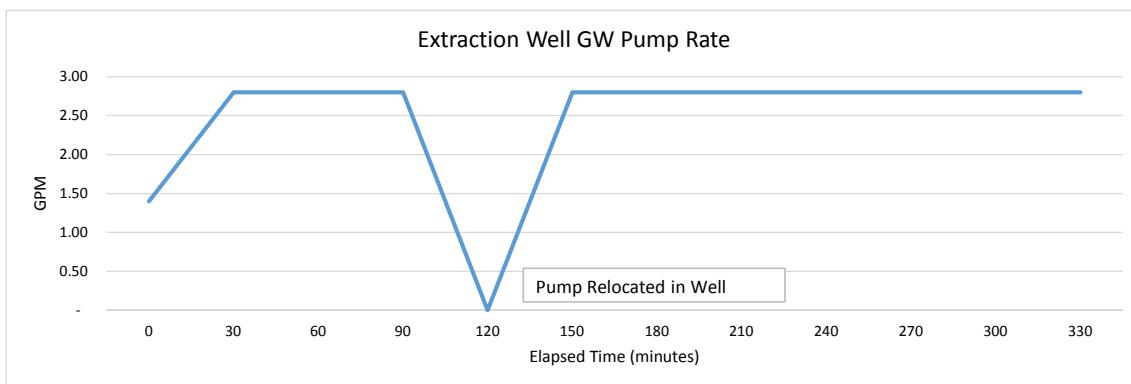

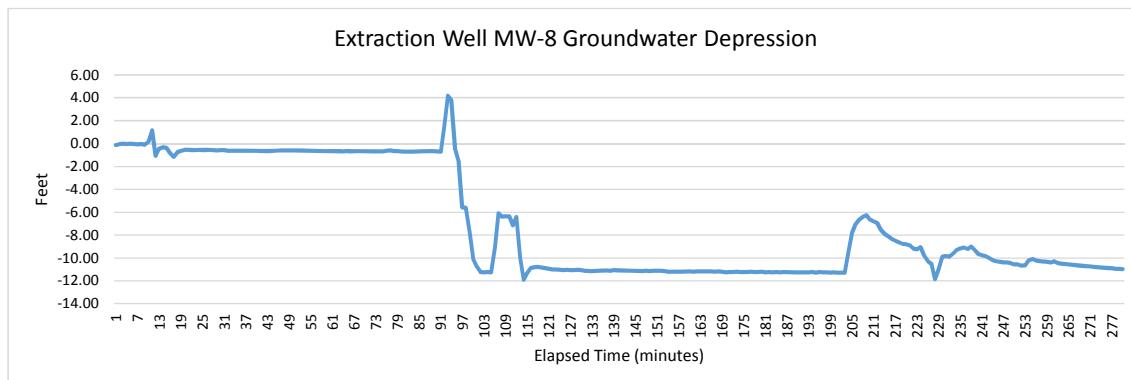

Paul D. Faucher
Vice President, Operations

Date:

11/29/16 1640 HRS MOBILIZED THE AcuVac SYSTEM NEAR WELL mw-8.
 GAUGED WELL, SO. 89 FT BDOC DTNAPL, 51.49 FT DTGW
 0.60 FT NAPL, HE 51.05. GW PUMP INLET POSITIONED
 1.5 FT ABOVE THE WELL BOTTOM.

MW-8 IS A 20" WELL AND ACCORDINGLY, THE DATA
 LOGGER WAS PLACED 1.0 FT ABOVE THE PUMP INLET

11/30/16 0750 ARRIVED ON SITE. PERFORMED TANKER SAFETY MTG.
 TEMPERATURES VERY LOW. VAC HOSE DEVELOPED CRAKS
 WHICH WERE REPAIRED. AcuVac SYSTEM WOULD NOT START
 DUE TO FROZEN PROpane VALVE.

0900 EVENT STARTED. INITIAL WELL VAC SET AT 80" H₂O
 RESULTING IN A WELL VAPOR FLOW OF 13.44 SCFM.
 GW PUMP STARTED BUT DID NOT PRODUCE LIQUID DUE TO
 POSSIBLY FROZEN WATERLINE.

0930 WELL VAPOR SAMPLE TAKEN. TPH VAPORS 29,160 PPmV.
1000 WELL VAC STEADY, WVF ↑ 16.45 SCFM
1030 WELL VAC STEADY, WVF ↑ 19.77 SCFM. WELL VAPOR
 SAMPLE OBTAINED. TPH VAPORS ↑ 34,510.

1115 GW PUMP STARTED. INITIAL SURGE OF NAPL AND THEN
 MOSTLY CLEAR LIQUID WITH A SHEEN

NOTE: THE INDUCED WELL VAC HAD TO BE REDUCED EACH
 TIME A WELL VAPOR SAMPLE WAS TAKEN.

Location: Johnston Federal #4, San Juan County, NM

Project Managers: Faucher / George

Date: 11/30/16

THE INITIAL PUMP PLACEMENT WAS BASED UPON THE FACT THE WELL WAS PUMPED DRY DURING INITIAL PRODUCTION AFTER IT WAS DRILLED. THE GW PUMP WAS STARTED AT 1145 HRS. THE INITIAL DRAWDOWN WAS APPROXIMATELY 50 FT. AFTER THE INITIAL DRAWDOWN, THE RATE SLOWED. IT WAS DETERMINED THAT THE PUMP SHOULD BE RELOCATED IN ORDER TO GET THE PUMP INLET CLOSER TO THE GW/NAPL INTERFACE.

1300 HRS THE GW PUMP INLET WAS RELOCATED TO APPROXIMATELY 52.5 FT BTOP. THE INITIAL DATA LOGGER READING WAS 3.47 FT WC ABOVE THE DATA LOGGER. THE PUMP INLET IS 1.0 FT BELOW THE DATA LOGGER.

1330 HRS THE PUMP WAS RESTARTED AT THE SAME PUMP OF 2.8 GPM. THE WATER COLUMN ABOVE THE DATA LOGGER DECREASED TO .01 FT. BUT THE PUMP RATE REMAINED STEADY AT 2.8 GPM.

* THIS INDICATES THAT THE GW PUMP WAS WITHIN 1.0 FT OF THE GW/NAPL INTERFACE.

NAPL .21

Location: Johnston Federal #4, San Juan County, NM

Project Managers: Faucher / George

Date: **12/1/16****NOTES**

PLACED THE GW PUMP IN WELL MW-3 AT APPROXIMATELY 1600HRS ON 12/30/16. GW PUMP POSITIONED 1.0 FT ABOVE WELL BOTTOM.

0720 ARRIVED ON SITE. CONNECTED VACUUM HOSES TO ACUVAC SYSTEM. CONNECTED GW PUMP DISCHARGE LINE TO TOTAL FLOW METER AND THEN TO STANDBY COLLECTION TANK.

0800 EVENT STARTED. INITIAL WELL VAC OF 70" H₂O WITH A WELL VAPOR FLOW OF 2.41 SCFM. WATER LINES WERE FROZEN DUE TO VERY LOW TEMPERATURE - 11°F. THAWED FROZEN LINES WITH A HEAT GUN.

0900 WELL VAC ↑ TO 80" H₂O. LIQUID MOUNDING IN WELL.

0945 GW PUMP STARTED. INITIAL FLOW RATE OF 2.0GPM.

1000 GW PUMP CLOGGED WITH BENTONITE THAT HAD BEEN DRAWN INTO PUMP. PUMP REMOVED FROM WELL CLEARED EXTERIOR OF PUMP. REPLACED PUMP IN WELL. RECEIVED PUMP CONTROLLER FAULT. REMOVED PUMP FROM WELL. DISASSEMBLED PUMP AND CLEANED ALL PARTS. REASSEMBLED AND REPLACED IN WELL.

1100 GW PUMP RESTARTED AT THE RATE OF 2.0 GPM. PUMP WORKING FINE. REDUCED WELL VAC TO 70" H₂O TO MAINTAIN CONSTANT DRAWDOWN. PUMP RATE NOT ADJUSTED.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Laboratory: TestAmerica Burlington

Narrative

Job Narrative
200-36530-1

Comments

No additional comments.

Receipt

The samples were received on 12/6/2016 10:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice.

Receipt Exceptions

During the canister pressure check performed upon receipt, it was observed that the following sample(s) was received at an elevated residual vacuum level: MW-8, MW-3. The samples are grabs, and therefore there are no flow controllers to be checked. The client was contacted, and the laboratory was instructed to proceed with analysis.

Air Toxics

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Question	Answer	Comment	
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	Lab does not accept radioactive samples.	6
The cooler's custody seal, if present, is intact.	True	Not present	7
Sample custody seals, if present, are intact.	True		8
The cooler or samples do not appear to have been compromised or tampered with.	True		9
Samples were received on ice.	N/A	Thermal preservation not required.	10
Cooler Temperature is acceptable.	True		11
Cooler Temperature is recorded.	N/A	Thermal preservation not required.	12
COC is present.	True		13
COC is filled out in ink and legible.	True		14
COC is filled out with all pertinent information.	True		15
Is the Field Sampler's name present on COC?	True		
There are no discrepancies between the containers received and the COC.	True		
Samples are received within Holding Time (excluding tests with immediate HTs)	True		
Sample containers have legible labels.	True		
Containers are not broken or leaking.	True		
Sample collection date/times are provided.	True		
Appropriate sample containers are used.	True		
Sample bottles are completely filled.	N/A		
Sample Preservation Verified.	True		
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True		
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True		
Multiphasic samples are not present.	True		
Samples do not require splitting or compositing.	True		
Residual Chlorine Checked.	N/A

¹ Batch Certification: The reading is taken on the "batch" canister and this value is used as the initial pressure for all canisters in the batch.

² Adjusted Initial Pressure = Initial Pressure + (Initial BP - Final BP).

³ Difference = Final Pressure - Adjusted Initial Pressure . Acceptance Criteria: (1) The difference must be less than or equal to + 0.5. (2) Pressure readings must be at least 24 hours apart.

If time frame was not met, the PM must authorize shipment of canister
PM Authorization Signature: _____ Date: _____

12	4916			-29.7	-0.2						

¹ Batch Certification: The reading is taken on the "batch" canister and this value is used as the initial pressure for all canisters in the batch.

² Adjusted Initial Pressure = Initial Pressure + (Initial BP - Final BP).

³ Difference = Final Pressure - Adjusted Initial Pressure. Acceptance Criteria: (1) The difference must be less than or equal to + 0.5. (2) Pressure readings must be at least 24 hours apart.

If time frame was not met, the PM must authorize shipment of canister

PM Authorization Signature:

Clean Canister Certification Analysis & Authorization of Release to Inventory

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments

No additional comments.

Receipt

The samples were received on 4/19/2016 9:43 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.0° C.

GC VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	1.0°C IR-6
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

Job Narrative 400-128739-1

Comments

No additional comments.

Receipt

The samples were received on 10/15/2016 9:13 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.9° C.

Receipt Exceptions

The following sample containers were received broken upon receipt: MW-20. There was insufficient sample to analyze due to both vials being received broken.

GC VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	745575
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	1.9°C IR5
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	False	Refer to Job Narrative for details.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
