Re: Site 3R-424 Quarterly Report for Heath Gas Com G1 Remediation Site

Dear Mr. Bayliss:

Attached is the 1st quarter 2016 update for groundwater remediation activity conducted at the Heath Gas Com G1 remediation site. This report was generated on behalf of BP by Trihydro Corporation and incorporates the most recent sampling and groundwater quality data. With the exception of well MW-6, which will be sampled next quarter, recent data show all monitoring wells have achieved BTEX levels below WQCC standards for at least eight consecutive quarters. BP has terminated operation of the air sparge remediation system and will be preparing a request for closure to NMOCD when all wells attain the closure standard.

If you have any questions, please feel free to contact me at (505) 330-9179 or at Steven.Moskal@bp.com.

Sincerely,

Steve Moskal
BP Lower 48-San Juan
Field Environmental Coordinator

memorandum

To: Mr. Steven Moskal
BP America Production, Farmington, NM

From: Mr. John Pietz, P.E.

cc: Mr. Jeff Blagg, Blagg Engineering, Inc.

Date: November 9, 2017

Re: First Quarter Report, January – March 2016, Heath GC G#1 Well Site
San Juan County, New Mexico

Trihydro Corporation (Trihydro) has been working with BP America Production (BP) and Blagg Engineering, Inc. (BEI) to investigate and remediate a condensate release at the Heath GC G#1 Well Site located in San Juan County, New Mexico (Figure 1). The purpose of this memorandum is to provide a summary of activities and field data for the first quarter period from January – March 2016. These activities include monitoring well sampling and gauging, and operation of the air sparge system. Recommendations for future work are also presented. Figure 1 provides a site location map, and Figure 2 provides a map of the remediation systems.

1.0 COMPLETED ACTIVITIES

Activities completed during the January – March 2016 period included:

- Quarterly gauging of fluid level elevations on February 24, 2016.
- Quarterly groundwater sampling for benzene, toluene, ethylbenzene, and xylenes (BTEX) on February 24, 2016 of seven wells.
- Operation of the air sparge system.

2.0 QUARTERLY GROUNDWATER GAUGING AND SAMPLING

As of February 24, 2016, the site monitoring well network includes 37 monitoring wells (2-inch diameter) and eight recovery wells (4-inch diameter). Well construction information is summarized in Table 1.

The saturated thickness of the water bearing zone at the site ranges from approximately 8 to 10 feet thick and consists of fine to medium sands. Based on boring logs of existing monitoring wells, a light blue clay and/or claystone underlies the water bearing zone. This lower confining layer is reportedly regional in extent. Based on available hydrogeological data, the water bearing zone resembles a well-defined groundwater flow channel that follows the topographic drainage channel westward toward the San Juan River.

2.1 GROUNDWATER GAUGING PROCEDURES

Depth to light non-aqueous phase liquid (LNAPL) petroleum, depth to groundwater, and total well depth, were measured in 27 monitoring wells on February 24, 2016 as part of the quarterly groundwater monitoring event. Groundwater gauging and sampling was completed by BEI. Fluid levels (groundwater and LNAPL, if any) and total depths were measured to an accuracy of 0.01 feet using a Solinst oil/water interface probe. The probe was decontaminated before use and between well locations using a biodegradable detergent (Simple Green) and distilled water.

2.2 GROUNDWATER GAUGING RESULTS

Fluid level elevations from the February 24, 2016 gauging event are summarized in Table 2, along with historical gauging data since December 2009. As shown in Table 2, LNAPL was not detected in site monitoring, or recovery wells gauged on February 24, 2016. The depth to water ranged from 24 to 31 feet below measuring point (ft-bmp), with shallower groundwater generally occurring to the west of the site.

The potentiometric surface contours for the February 24, 2016 data are shown on Figure 3. Groundwater generally appears to flow east to west at an average gradient of approximately 0.011 ft/ft between the release area and the down-gradient edge of the site at County Road 4460 (CR 4460), which is consistent with previous results. Hydrographs for four site monitoring wells (MW-1, MW-7, MW-17, and MW-34), located on the east and central areas of the site, are shown on Figure 4.

3.0 GROUNDWATER QUALITY

The groundwater underlying the site is sampled and analyzed to monitor the nature, degree, and extent of impacts associated with the Heath GC G#1 Well Site condensate release. Additionally, the groundwater quality information is being utilized to evaluate progress towards remediating and mitigating the migration of residual dissolved-phase organic compounds. Groundwater quality sampling procedures and results are described below.

3.1 GROUNDWATER QUALITY SAMPLING METHODS

During the February 2016 sampling event, groundwater samples were collected from three wells, MW-6, and RW-19 (Table 3). Numerous wells have attained groundwater standards for eight consecutive quarters and were not sampled during this monitoring period. Samples were collected by purging three well casing volumes of water and collecting a sample in a dedicated disposable bailer. All samples were collected in new laboratory-provided sample containers with preservatives and placed on ice in laboratory provided coolers. The samples were submitted under appropriate chain-of-custody, sample analyses request (COC/SAR) protocol. The samples were analyzed by Hall Environmental Laboratory (Albuquerque, New Mexico) for BTEX by USEPA SW-846 Method 8260B.

3.2 GROUNDWATER QUALITY SAMPLING RESULTS

The analytical results for BTEX for the current and past sampling events are presented in Table 3. Figure 5 provides a summary map of the February 2016 quarterly results for site monitoring wells. The tables and figures include comparisons to the New Mexico Water Quality Control Commission (NMWQCC) standards set forth in the New Mexico Administrative Code §20.6.2.3103. Figures 6 through 8 summarize historical benzene concentration trends from key wells in the central, northern, and western areas of the site, respectively. The complete analytical report for the February 2016 event is presented in Attachment A.

Several observations can be drawn from the February 2016 results, as follows:

- Benzene was not detected above the NMWQCC standard of 10 micrograms per liter (ug/L).
- Toluene was not detected above the NMWQCC standard of 750 ug/L.
- Ethylbenzene was not detected above the NMWQCC standard of 750 ug/L.
- Xylene was not detected above the NMWQCC standard of 620 ug/L.
- All sampled wells are below the NMWQCC standards for BTEX for this quarter.
- RW-19 and MW-6 have attained eight and seven consecutive quarters, respectively, of compliance with NMWQCC standards for BTEX.

4.0 REMEDIATION SYSTEM OPERATION AND OPTIMIZATION

Currently, groundwater remediation at the site consists of air sparging. A groundwater extraction system was also installed at the site, and began operations in September 2012; however, the groundwater extraction system is not operating at present because the air sparge system alone is sufficient for remediation of the residual groundwater hydrocarbons. Further details of current remedial activities are provided below.

4.1 AIR SPARGE SYSTEM

The air sparge system was installed in several phases, and started operation in March 2010. The current air sparge system is shown in Figure 2. The system consists of three areas with 69 wells: the central area consisting of 30 wells (AS-1 through AS-30), the west area consisting of 15 wells (AS-55 through AS-69), and the northeast area consisting of 24 wells (AS-31 through AS-54). The central and northeast area systems were installed in February - August 2010. The western area system was installed in June and July 2010 in response to elevated BTEX concentrations down-gradient of well MW-30, and detections of BTEX in down-gradient wells MW-41 through MW-44.

The west and northeast system air sparge wells are completed to an average depth of approximately 8-10 feet below the water table. The central air sparge wells are completed to an average depth

approximately 7 feet below the water table surface. All air sparge wells consist of 2-inch schedule 40 PVC well materials, with 1.5 ft of screen. Air supply headers are also constructed of 2-inch schedule 40 PVC pipe.

Currently, the air supply for the air sparge system consists of two dedicated positive displacement blowers powered by utility power. The system had previously used a natural gas generator for the on-site blower power. Prior to installation of the dedicated blowers, two portable diesel powered compressors were used to provide air flow to the air sparge wells.

The northeast area, which had not been operated due to its up-gradient location relative to the plume, was activated on July 10, 2013 to remediate an area likely to contain residual source hydrocarbons. As demonstrated by subsequent quarterly sampling results, operation of air sparging in the source area has resulted in significant reductions in ethylbenzene and xylene concentrations.

Performance of the air sparge system is tracked and evaluated through the groundwater monitoring program described above. This system has been effective in reducing BTEX concentrations in numerous site monitoring wells (see Figures 6, 7 and 8). In addition to the volatilization of BTEX associated with sparging, contaminant mass loss may also be attributable to natural attenuation process such as aerobic biodegradation, advection, dispersion, and dilution.

4.2 GROUNDWATER EXTRACTION SYSTEM

The groundwater extraction system at the site began operation on September 4, 2012 and operated for approximately two months prior to onsite generator issues and the onset of winter weather. This system is currently not operated, given the absence of BTEX in down-gradient wells and the substantial remedial progress that has been achieved at the site.

The recovery wells for the system consist of five wells (RW-49, RW-50, RW-52, RW-53, and RW-54) operated as a hydraulic barrier to control migration of the groundwater plume. When operational, the flow rate was approximately 8 gpm from RW-49.

The treatment system consists of the following unit operations: oil/water separation, chemical sequestration injection, air stripping, bag filtration, and injection into eight upgradient injection wells. While operational, influent and effluent groundwater to the system were sampled monthly, and results were submitted in a previous report.

4.3 LNAPL RECOVERY

An LNAPL recovery system consisting of skimmer pumps operated at the site from June through September 2010. Skimmers are currently not deployed at the site. Operation was terminated when

Mr. Steven Moskal
November 9, 2017
Page 5

LNAPL was no longer detected in sufficient thickness for skimmer operation. LNAPL has not been detected at the site since September 2010. The total volume of recovered LNAPL is estimated to be approximately 120 gallons.

4.4 REMEDIATION SYSTEM OPTIMIZATION

In consultation with BP, the following recommendations have been identified to optimize site remediation:

- Continue to operate the air sparge system within the source area to achieve the required eight consecutive quarters of compliance with BTEX groundwater standards in all monitoring wells.
- Sample MW-6 next quarter to determine if eight consecutive quarters have been achieved at that well.

5.0 SUMMARY OF OPERATIONS TO DATE

Significant improvements in groundwater quality have been achieved by operation of the remediation systems at the site since 2010. All monitoring wells sampled this quarter fell below the NMWQCC standards for BTEX. Following three additional consecutive quarters of compliance with standards, the site will likely qualify for closure.

NMWQCC GROUNDWATER		10	750	750	620

Notes:

ug/L - micrograms per liter

ND(1) - not detected, with detection limit (ug/L)

NMWQCC - New Mexico Water Quality Control Commission groundwater standards

- Data collected prior to June 2010 and on 7/6/10, 7/16/10,

8/19/10, 8/23/10, and after November 2010 based on bailer sampling completed by Blagg Engineering, Inc. See lab report for method.

- Data collected between June 2010 and December 2010 based on low-flow sampling completed by Trihydro Corporation and analyzed by Pace Labs (Lenexa, Kansas) by USEPA 8260B

RE: HEATH GC G #1

OrderNo.: 1602A63

Dear Nelson Velez:

Hall Environmental Analysis Laboratory received 2 sample(s) on 2/25/2016 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. In order to properly interpret your results it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0190

Sincerely,

A handwritten signature in black ink, appearing to read 'Andy Freeman', is written over a horizontal line.
