Re: Site 3R-424 Quarterly Report for Heath Gas Com G1 Remediation Site

Dear Mr. [ ]:

Attached is the 2<sup>nd</sup> quarter 2016 update for groundwater remediation activity conducted at the Heath Gas Com G1 remediation site. This report was generated on behalf of BP by Trihydro Corporation and incorporates the most recent sampling and groundwater quality data. Recent data show all monitoring wells have achieved BTEX levels below WQCC standards for at least eight consecutive quarters. BP has terminated operation of the air sparge remediation system and will be preparing a request for closure to NMOCD.

If you have any questions, please feel free to contact me at (505) 330-9179 or at [Steven.Moskal@bp.com](mailto:Steven.Moskal@bp.com).

Field Environmental Coordinator

## memorandum

**To:** Mr. Steven Moskal  
BP America Production, Farmington, NM

**From:** Mr. John Pietz, P.E.

**cc:** Mr. Jeff Blagg, Blagg Engineering, Inc.

**Date:** November 9, 2017

**Re:** Second Quarter Report, April – June 2016, Heath GC G#1 Well Site  
San Juan County, New Mexico

---

Trihydro Corporation (Trihydro) has been working with BP America Production (BP) and Blagg Engineering, Inc. (BEI) to investigate and remediate a condensate release at the Heath GC G#1 Well Site located in San Juan County, New Mexico (Figure 1). The purpose of this memorandum is to provide a summary of activities and field data for the second quarter period from April – June 2016. These activities include monitoring well sampling and gauging, and operation of the air sparge system. Recommendations for future work are also presented. Figure 1 provides a site location map, and Figure 2 provides a map of the remediation systems.

### 1.0 COMPLETED ACTIVITIES

Activities completed during the April – June 2016 period included:

- Quarterly gauging of fluid level elevations in 27 wells on June 2, 2016.
- Quarterly groundwater sampling for benzene, toluene, ethylbenzene, and xylenes (BTEX) on June 2, 2016 of one well (MW-6), which had not attained eight consecutive quarters of compliance with groundwater standards.

### 2.0 QUARTERLY GROUNDWATER GAUGING AND SAMPLING

As of June 2, 2016, the site monitoring well network includes 37 monitoring wells (2-inch diameter) and eight recovery wells (4-inch diameter). Well construction information is summarized in Table 1.

The saturated thickness of the water bearing zone at the site ranges from approximately 8 to 10 feet thick and consists of fine to medium sands. Based on boring logs of existing monitoring wells, a light blue clay and/or claystone underlies the water bearing zone. This lower confining layer is reportedly regional in extent. Based on available hydrogeological data, the water bearing zone resembles a well-defined groundwater flow channel that follows the topographic drainage channel westward toward the San Juan River.

#### 2.1 GROUNDWATER GAUGING PROCEDURES

Depth to light non-aqueous phase liquid (LNAPL) petroleum, depth to groundwater, and total well depth, were measured in 27 monitoring wells on June 2, 2016 as part of the quarterly groundwater monitoring

event. Groundwater gauging and sampling was completed by BEI. Fluid levels (groundwater and LNAPL, if any) and total depths were measured to an accuracy of 0.01 feet using a Solinst oil/water interface probe. The probe was decontaminated before use and between well locations using a biodegradable detergent (Simple Green) and distilled water.

## **2.2 GROUNDWATER GAUGING RESULTS**

Fluid level elevations from the June 2, 2016 gauging event are summarized in Table 2, along with historical gauging data since December 2009. As shown in Table 2, LNAPL was not detected in site monitoring, or recovery wells gauged on June 2, 2016. The depth to water ranged from 24 to 31 feet below measuring point (ft-bmp), with shallower groundwater generally occurring to the west of the site.

The potentiometric surface contours for the June 2, 2016 data are shown on Figure 3. Groundwater generally appears to flow east to west at an average gradient of approximately 0.009 ft/ft between the release area and the down-gradient edge of the site at County Road 4460 (CR 4460), which is consistent with previous results. Hydrographs for four site monitoring wells (MW-1, MW-7, MW-17, and MW-34), located on the east and central areas of the site, are shown on Figure 4.

## **3.0 GROUNDWATER QUALITY**

The groundwater underlying the site is sampled and analyzed to monitor the nature, degree, and extent of impacts associated with the Heath GC G#1 Well Site condensate release. Additionally, the groundwater quality information is being utilized to evaluate progress towards remediating and mitigating the migration of residual dissolved-phase organic compounds. Groundwater quality sampling procedures and results are described below.

### **3.1 GROUNDWATER QUALITY SAMPLING METHODS**

During the June 2016 sampling event, groundwater samples were collected from one well, MW-6 (Table 3). This well had not attained groundwater standards for eight consecutive quarters and was sampled during this monitoring period. Samples were collected by purging three well casing volumes of water and collecting a sample in a dedicated disposable bailer. The sample was collected in new laboratory-provided sample containers with preservatives and placed on ice in laboratory provided coolers. The sample was submitted under appropriate chain-of-custody, sample analyses request (COC/SAR) protocol. The sample was analyzed by Hall Environmental Laboratory (Albuquerque, New Mexico) for BTEX by USEPA SW-846 Method 8260B.

### **3.2 GROUNDWATER QUALITY SAMPLING RESULTS**

The analytical results for BTEX for the current and past sampling events are presented in Table 3. Figure 5 provides a summary map of the June 2016 quarterly results for site monitoring wells. The tables

Mr. Steven Moskal  
November 9, 2017  
Page 3

and figures include comparisons to the New Mexico Water Quality Control Commission (NMWQCC) standards set forth in the New Mexico Administrative Code §20.6.2.3103. Figures 6 through 8 summarize historical benzene concentration trends from key wells in the central, northern, and western areas of the site, respectively. The complete analytical report for the June 2016 event is presented in Attachment A.

Several observations can be drawn from the June 2016 results for MW-6, as follows:

- Benzene was not detected above the NMWQCC standard of 10 micrograms per liter (ug/L).
- Toluene was not detected above the NMWQCC standard of 750 ug/L.
- Ethylbenzene was not detected above the NMWQCC standard of 750 ug/L.
- Xylene was not detected above the NMWQCC standard of 620 ug/L.
- This well has now completed 8 consecutive quarters of compliance with the above standards.

## **4.0 REMEDIATION SYSTEM OPERATION AND OPTIMIZATION**

Currently, groundwater remediation at the site consists of air sparging. A groundwater extraction system was also installed at the site, and began operations in September 2012; however, the groundwater extraction system is not operating at present because the air sparge system alone is sufficient for remediation of the residual groundwater hydrocarbons. Further details of current remedial activities are provided below.

### **4.1 AIR SPARGE SYSTEM**

The air sparge system was installed in several phases, and started operation in March 2010. The current air sparge system is shown in Figure 2. The system consists of three areas with 69 wells: the central area consisting of 30 wells (AS-1 through AS-30), the west area consisting of 15 wells (AS-55 through AS-69), and the northeast area consisting of 24 wells (AS-31 through AS-54). The central and northeast area systems were installed in February - August 2010. The western area system was installed in June and July 2010 in response to elevated BTEX concentrations down-gradient of well MW-30, and detections of BTEX in down-gradient wells MW-41 through MW-44.

The west and northeast system air sparge wells are completed to an average depth of approximately 8-10 feet below the water table. The central air sparge wells are completed to an average depth approximately 7 feet below the water table surface. All air sparge wells consist of 2-inch schedule 40 PVC well materials, with 1.5 ft of screen. Air supply headers are also constructed of 2-inch schedule 40 PVC pipe.

Currently, the air supply for the air sparge system consists of two dedicated positive displacement blowers powered by utility power. The system had previously used a natural gas generator for the on-site blower power. Prior to installation of the dedicated blowers, two portable diesel powered compressors were used to provide air flow to the air sparge wells.

The northeast area, which had not been operated due to its up-gradient location relative to the plume, was activated on July 10, 2013 to remediate an area likely to contain residual source hydrocarbons. As demonstrated by subsequent quarterly sampling results, operation of air sparging in the source area has resulted in significant reductions in ethylbenzene and xylene concentrations.

Performance of the air sparge system is tracked and evaluated through the groundwater monitoring program described above. This system has been effective in reducing BTEX concentrations in numerous site monitoring wells (see Figures 6, 7 and 8). In addition to the volatilization of BTEX associated with sparging, contaminant mass loss may also be attributable to natural attenuation process such as aerobic biodegradation, advection, dispersion, and dilution.

#### **4.2 GROUNDWATER EXTRACTION SYSTEM**

The groundwater extraction system at the site began operation on September 4, 2012 and operated for approximately two months prior to onsite generator issues and the onset of winter weather. This system is currently not operated, given the absence of BTEX in down-gradient wells and the substantial remedial progress that has been achieved at the site.

The recovery wells for the system consist of five wells (RW-49, RW-50, RW-52, RW-53, and RW-54) operated as a hydraulic barrier to control migration of the groundwater plume. When operational, the flow rate was approximately 8 gpm from RW-49.

The treatment system consists of the following unit operations: oil/water separation, chemical sequestration injection, air stripping, bag filtration, and injection into eight upgradient injection wells. While operational, influent and effluent groundwater to the system were sampled monthly, and results were submitted in a previous report.

#### **4.3 LNAPL RECOVERY**

An LNAPL recovery system consisting of skimmer pumps operated at the site from June through September 2010. Skimmers are currently not deployed at the site. Operation was terminated when LNAPL was no longer detected in sufficient thickness for skimmer operation. LNAPL has not been detected at the site since September 2010. The total volume of recovered LNAPL is estimated to be approximately 120 gallons.

Mr. Steven Moskal

November 9, 2017

Page 5

#### **4.4 REMEDIATION SYSTEM OPTIMIZATION**

In consultation with BP, the following recommendations have been identified to optimize site remediation:

- Terminate operation of the air sparge system
- Prepare the final quarterly reports and prepare a site closure report, given that the required eight consecutive quarters of compliance with BTEX groundwater standards in all monitoring wells.

#### **5.0 SUMMARY OF OPERATIONS TO DATE**

Significant improvements in groundwater quality have been achieved by operation of the remediation systems at the site since 2010, and all sampled wells have attained the required eight consecutive quarters of compliance with NMWQCC standards for BTEX.

<b>NMWQCC GROUNDWATER</b>		10	750	750	620

Notes:

ug/L - micrograms per liter

ND(1) - not detected, with detection limit (ug/L)

NMWQCC - New Mexico Water Quality Control Commission groundwater standards

- Data collected prior to June 2010 and on 7/6/10, 7/16/10,

8/19/10, 8/23/10, and after November 2010 based on bailer sampling completed by Blagg Engineering, Inc. See lab report for method.

- Data collected between June 2010 and December 2010 based on low-flow sampling completed by Trihydro Corporation and analyzed by Pace Labs (Lenexa, Kansas) by USEPA 8260B

RE: Heath GC G 1

OrderNo.: 1606237

Dear Nelson Velez:

Hall Environmental Analysis Laboratory received 1 sample(s) on 6/4/2016 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to [www.hallenvironmental.com](http://www.hallenvironmental.com) or the state specific web sites. In order to properly interpret your results it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0190

Sincerely,

A handwritten signature in black ink, appearing to read "Andy Freeman".

Analytical Report

Lab Order **1606237**

Date Reported: **6/13/2016**

**CLIENT:** Blagg Engineering

**Client Sample ID:** MW # 6

**Project:** Heath GC G 1

**Collection Date:** 6/2/2016 9:00:00 AM

**Lab ID:** 1606237-001

**Matrix:** AQUEOUS

**Received Date:** 6/4/2016 9:00:00 AM

<b>Analyses</b>	<b>Result</b>	<b>PQL</b>	<b>Qual</b>	<b>Units</b>	<b>DF</b>	<b>Date Analyzed</b>	<b>Batch</b>
<b>EPA METHOD 8021B: VOLATILES</b>							
Benzene	ND	1.0		µg/L	1	6/10/2016 12:05:42 AM	B34815
Toluene	ND	1.0		µg/L	1	6/10/2016 12:05:42 AM	B34815
Ethylbenzene	ND	1.0		µg/L	1	6/10/2016 12:05:42 AM	B34815
Xylenes, Total	ND	2.0		µg/L	1	6/10/2016 12:05:42 AM	B34815
Surr: 4-Bromofluorobenzene	110	87.9-146		%Rec	1	6/10/2016 12:05:42 AM	B34815

Refer to the QC Summary report and sample login checklist for flagged QC data and preservation information.

<b>Qualifiers:</b>	*	Value exceeds Maximum Contaminant Level.	B	Analyte detected in the associated Method Blank
	D	Sample Diluted Due to Matrix	E	Value above quantitation range
	H	Holding times for preparation or analysis exceeded	J	Analyte detected below quantitation limits
	ND	Not Detected at the Reporting Limit	P	Sample pH Not In Range
	R	RPD outside accepted recovery limits	RL	Reporting Detection Limit
	S	% Recovery outside of range due to dilution or matrix	W	Sample container temperature is out of limit as specified

### Chain of Custody

1. Custody seals intact on sample bottles?

Yes  No  Not Present

2. Is Chain of Custody complete?

Yes  No  Not Present

3. How was the sample delivered?

Courier

### Log In

4. Was an attempt made to cool the samples?

Yes  No  NA

5. Were all samples received at a temperature of >0° C to 6.0°C

Yes  No  NA

6. Sample(s) in proper container(s)?

Yes  No

7. Sufficient sample volume for indicated test(s)?

Yes  No

8. Are samples (except VOA and ONG) properly preserved?

Yes  No

9. Was preservative added to bottles?

Yes  No  NA

10. VOA vials have zero headspace?

Yes  No  No VOA Vials

11. Were any sample containers received broken?

Yes  No   
# of preserved bottles checked for pH:  
(<2 or >12 unless noted)

12. Does paperwork match bottle labels?  
(Note discrepancies on chain of custody)

Yes  No  Adjusted?

13. Are matrices correctly identified on Chain of Custody?

Yes  No

14. Is it clear what analyses were requested?

Yes  No

15. Were all holding times able to be met?

Yes  No  Checked by:

(If no, notify customer for authorization.)

### Special Handling (if applicable)

16. Was client notified of all discrepancies with this order?

Yes  No  NA
