**RE: Response to Approval with Modifications
Investigation Work Plan May 17, 2018 Slop Oil Line Release
Western Refining Southwest, Inc. – Bloomfield Terminal
EPA ID# NMD089416416
HWB-WRB-18-014**

Dear Mr. Pierard:

Bloomfield Terminal is submitting the enclosed response to comments received from NMED on March 3, 2020 regarding the referenced Investigation Work Plan. If there are any questions, please contact me at (419) 421- 2338 at your convenience.

Certification

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,
Western Refining Southwest, Inc.

RESPONSE TO COMMENTS
March 3, 2020 Approval with Modifications
Investigation Work Plan Slop Oil Line Release (May 2018)

NMED Comment 1:

In Section 2 (Background), page 2-3, Western describes the release that occurred from the slop oil pipeline. Provide the following information:

- a. According to the description, Western removed 285 cubic yards of soil but did not report whether liquid was removed from the site. Report the amount of liquid removed from the site in the response letter and the final C-141.
- b. Based on the original e-mailed notifications on May 18, 2019, the release was identified by visual inspection. State whether there were other types of indicators that were used to identify the release in the response letter.
- c. Along with the C-141, several photographs have been provided that showed the area where the release occurred as well as the open trench with the exposed pipelines. However, Western has not provided a scaled figure that includes the dimensions of the open trench or the depth that the soil was excavated. Provide a scaled figure with the dimensions of the open trench with the response letter.
- d. In an e-mail dated June 19, 2018, Western provided results for three composite soil samples and a picture of the open trench. Western did not provide a figure with the locations that the samples were collected. Furthermore, Western did not provide the sample depths or the rationale for the sample locations. Provide a scaled figure with the sample locations as well as discuss the reasons for the selected sample locations in the response letter. Also provide the sample depths in the response letter.

Western Response 1:

- a. In the second paragraph of page 2-3 of the Investigation Work Plan, there is a reference to the removal of free liquids. There was an estimated 1,075 barrels of mostly water recovered. Fire water was flushed through the line to help identify the location of the leak.
- b. A visual observation of steam in the area of the culvert was the first sign of a possible problem. While investigating the source of the steam, a slight hydrocarbon odor was observed suggesting a possible release of hydrocarbons.
- c. As the excavations had to be backfilled due to safety concerns with the close proximity to the County road, there are no exact dimensions available. However, an estimate of the lateral dimensions of the excavation (i.e., 10 feet by 12 feet) have been included on two photos, which are enclosed. The excavation depth is estimated at 4 feet.
- d. The locations of the three composite samples are discussed in the last paragraph on page 2-3 of the Investigation Work Plan. Each sample was a five-part composite that was collected across the respective face of the excavation; north side wall, west side wall, and bottom/floor of the excavation. Each aliquot was collected to provide a representative sample of the respective face through the compositing process and there is no record of the location where each individual aliquot was collected. As to depths, the samples were collected directly from the face of the excavation. Assuming a depth of approximately 4 feet, the floor samples would have been collected at a depth of approximately 4 feet from the original land surface. The wall samples would have ranged from 0.5 feet to 3.5 feet from the original land surface.

NMED Comment 2:

Section 5.2 (Soil Sampling), pages 5-1 to 5-3, Western discusses the soil sampling method and procedures and proposes to collect soil samples from four soil borings "to a minimum depth of six feet below the pipeline or to the vertical extent of any observed impacts." Figure 9 (Sample Location Map) depicts the excavation location and the four proposed soil sample locations. The soil sample locations appear to be too far away from the pipeline on the north side, and it is unclear why the soil sample locations are located so far north of the release site. Propose to include two additional soil sample locations with the following:

- a. The additional soil samples must be collected between the southern limit of the excavation and the two proposed southern soil sample locations depicted on Figure 9. Provide a revised Figure 9 that includes the added sample locations with the response letter.
- b. All soil samples must be collected within three to five feet laterally from the excavation boundary. These soil samples should laterally delineate the extent of the release as well as determine if the release migrated below the pipelines.

Western Response 2:

The samples located to the north of the excavation are placed as close as reasonably possible to the north side of the excavation to allow access with a drilling rig. There is a steep slope between the north side of the security fence and top of the tank dike located immediately to the north. We will locate the two northern borings as far to the south as physically possible considering site conditions.

- a. The comment requires that two additional soil borings be located between the southern limit of the excavation and the two proposed southern soil sample location depicted on Figure 9. Given the fact that County Road 4990 lies immediately on the south side of the excavation requires that we maintain a safe working distance to the north of the southern limit of the excavation/County Road 4990. Based on the presence of a ditch in this location, we cannot project exactly where the borings can be located relative to the road, but it is likely that the two additional borings would fall within less than five feet from the currently proposed southern borings. We can use a hand auger to collect samples at the requested location, but it will of course be subject to limitations in the sampling depth. Figure 9 is revised to show two additional hand auger locations. In addition, the increase to six borings is changed on pages 4-1, 5-1, and 5-2. Replacement pages and a redline copy showing the changes is enclosed.
- b. As noted above, the borings to the north will be further than three to five feet from the excavation unless NMED desires that we use a hand auger instead, but we do not anticipate that we can get deep enough with a hand auger through the tank dike wall to adequately assess beneath the pipelines running to the north.

NMED Comment 3:

Section 5.3 (Groundwater Water Monitoring), page 5-4, Western states that "no groundwater samples are proposed under this Scope of Work." However, Western did not state how long the pipeline may have been leaking. It is possible that the release may have been leaking for some time and may have migrated to groundwater. Furthermore, Table 2 (Ground Water Analytical Results Summary) did not include monitoring wells MW-30 and MW-44 which are located east of the release. Include data from these two monitoring wells with the report and provide a discussion if the analytical data indicates that the release migrated into the groundwater.

MPC Response 3:

The comment is acknowledged. The information will be included in the report.

Section 4

Scope of Services

4.1 Anticipated Activities

Pursuant to Section IV of the Order, a scope of services has been developed to determine and evaluate the presence, nature, extent, fate, and transport of contaminants resulting from the release of slop oil discovered on May 17, 2018. To accomplish this objective soil samples will be collected in the area of the release. Six soil borings are proposed to be drilled to a minimum depth of six feet below the pipeline or to the vertical extent of any observed impacts, whichever is deeper. Soil borings will be installed and samples collected as discussed in Section 5.2.

4.2 Background Information Research

Documents containing the results of previous investigations and subsequent routine groundwater monitoring data from monitoring wells were reviewed to facilitate development of this work plan. The previously collected data provide detailed information on the overall subsurface conditions, including hydrogeology and contaminant distribution within groundwater on a site-wide basis.

4.3 Collection and Management of Investigation Derived Waste

Drill cuttings, excess sample material and decontamination fluids, and all other investigation derived waste (IDW) associated with soil borings will be contained and characterized using methods based on the boring location, boring depth, drilling method, and type of contaminants suspected or encountered. All decontamination water will be disposed in the terminal wastewater treatment system upstream of the API Separator. An IDW management plan is included as Appendix D.

4.4 Surveys

The horizontal coordinates and elevation of each boring and the locations of all other pertinent structures will be determined by a registered New Mexico professional land surveyor in accordance with the State Plane Coordinate System (NMSA 1978 47-1-49-56 (Repl. Pamp. 1993)). The surveys will be conducted in accordance with Sections 500.1 through 500.12 of the Regulations and Rules of the Board of Registration for Professional Engineers and Surveyors Minimum Standards for Surveying in New Mexico. Horizontal positions will be measured to the nearest 0.1-ft and vertical elevations will be measured to the nearest 0.01-ft.

Section 5

Investigation Methods

The purpose of the site investigation is to determine and evaluate the presence, nature, and extent of releases of contaminants. Guidance on selecting and developing sampling plans as provided in *Guidance for Choosing a Sampling Design for Environmental Data Collection* (EPA, 2000) was utilized to select the appropriate sampling strategy.

5.1 Drilling Activities

Soil borings will be drilled using either hollow-stem auger or if necessary, air rotary methods including ODEX. The preferred method will be hollow-stem auger to increase the ability to recover undisturbed samples and potential contaminants. Shallow soil samples may be collected using a hand auger until the boring has cleared any underground utilities. The hand auger will also be used collect samples at those locations where a safe working distance from County Road 4990 has to be maintained. The drilling equipment will be properly decontaminated before drilling each boring.

The NMED/OCD will be notified as early as practicable if conditions arise or are encountered that do not allow the advancement of borings to the specified depths or at planned sampling locations. Appropriate actions (e.g., installation of protective surface casing or relocation of borings to a less threatening location) will be taken to minimize any negative impacts from investigative borings. Soil samples will be collected continuously and logged by a qualified geologist or engineer.

The drilling and sampling will be accomplished under the direction of a qualified engineer or geologist who will maintain a detailed log of the materials and conditions encountered in each boring. Both sample information and visual observations of the cuttings and core samples will be recorded on the boring log. Known site features and/or site survey grid markers will be used as references to locate each boring prior to surveying the location as described in Section 4.4. The boring locations will be measured to the nearest foot, and locations will be recorded on a scaled site map upon completion of each boring.

5.2 Soil Sampling

Since the location of the release is known, a judgmental sampling design is appropriate. Borings located along the pipelines will be spaced off the pipeline to avoid hitting the pipeline while drilling

but kept within a maximum of five feet of the pipelines, as possible considering necessary safety concerns. Six soil borings are proposed, with one on either side of the excavation (east and west), two borings to the north along the pipeline, and two hand auger borings located closer to the southern limit of the excavation (Figure 9). The slop oil line and the other lines that run together extend below ground approximately 40 feet to the north, where they come above-ground. The two northern borings will be located approximately 20 feet north of the excavation. No soil borings are proposed to the south of the road, as the release only exited the northern end of the culvert. All soil borings will be extended to a minimum depth of six feet below the depth of the adjacent pipelines. If there is screening evidence of impacted soils (e.g., petroleum odor, staining, or elevated photo-ionization detector or a combustible gas indicator readings) at six feet below the pipeline, then the boring will be extended deeper until either there is no evidence of impacts or groundwater is encountered, whichever occurs first.

The decision to use a hand auger vs. a drilling rig will be based on accessibility and health and safety concerns, although most locations are anticipated to be completed using a drilling rig. A decontaminated split-barrel sampler or continuous five-foot core barrel will be used to obtain samples during the drilling of each boring. Soil samples may be collected using decontaminated, hand-held stainless steel sampling device, shelly tube, or thin-wall sampler, or a pre-cleaned disposable sampling device. A portion of the samples will be placed in pre-cleaned, laboratory-prepared sample containers for laboratory chemical analysis. The use of an Encore® Sampler or other similar device will be used during collection of soil samples for VOC analysis. The remaining portions of the sample will be used for logging and field screening as discussed in Section 5.2.1. Sample handling and chain-of-custody procedures will be in accordance with the procedures presented below in Section 5.4.

Discrete soil samples will be collected for laboratory analyses from within the following intervals:

- 1-2' below the bottom depth of the adjacent pipeline (all soil borings);
 - 5-6' below the bottom depth of the adjacent pipeline or the lowermost one foot interval on soil borings penetrating deeper than six feet below the pipeline (all soil borings);
 - from the interval in each soil boring with the greatest apparent degree of contamination based on field screening (only soil borings with observed potential impacts);
 - From the 6" interval at the top of saturation (applicable only to borings that reach saturation); and
 - Any additional intervals as determined based on field screening results.
-

Section 4

Scope of Services

4.1 Anticipated Activities

Pursuant to Section IV of the Order, a scope of services has been developed to determine and evaluate the presence, nature, extent, fate, and transport of contaminants resulting from the release of slop oil discovered on May 17, 2018. To accomplish this objective soil samples will be collected in the area of the release. ~~Six~~ Four soil borings are proposed to be drilled to a minimum depth of six feet below the pipeline or to the vertical extent of any observed impacts, whichever is deeper. Soil borings will be installed and samples collected as discussed in Section 5.2.

4.2 Background Information Research

Documents containing the results of previous investigations and subsequent routine groundwater monitoring data from monitoring wells were reviewed to facilitate development of this work plan. The previously collected data provide detailed information on the overall subsurface conditions, including hydrogeology and contaminant distribution within groundwater on a site-wide basis.

4.3 Collection and Management of Investigation Derived Waste

Drill cuttings, excess sample material and decontamination fluids, and all other investigation derived waste (IDW) associated with soil borings will be contained and characterized using methods based on the boring location, boring depth, drilling method, and type of contaminants suspected or encountered. All decontamination water will be disposed in the terminal wastewater treatment system upstream of the API Separator. An IDW management plan is included as Appendix D.

4.4 Surveys

The horizontal coordinates and elevation of each boring and the locations of all other pertinent structures will be determined by a registered New Mexico professional land surveyor in accordance with the State Plane Coordinate System (NMSA 1978 47-1-49-56 (Repl. Pamp. 1993)). The surveys will be conducted in accordance with Sections 500.1 through 500.12 of the Regulations and Rules of the Board of Registration for Professional Engineers and Surveyors Minimum Standards for Surveying in New Mexico. Horizontal positions will be measured to the nearest 0.1-ft and vertical elevations will be measured to the nearest 0.01-ft.

Section 5

Investigation Methods

The purpose of the site investigation is to determine and evaluate the presence, nature, and extent of releases of contaminants. Guidance on selecting and developing sampling plans as provided in *Guidance for Choosing a Sampling Design for Environmental Data Collection* (EPA, 2000) was utilized to select the appropriate sampling strategy.

5.1 Drilling Activities

Soil borings will be drilled using either hollow-stem auger or if necessary, air rotary methods including ODEX. The preferred method will be hollow-stem auger to increase the ability to recover undisturbed samples and potential contaminants. Shallow soil samples may be collected using a hand auger until the boring has cleared any underground utilities. [The hand auger will also be used collect samples at those locations where a safe working distance from County Road 4990 has to be maintained.](#) The drilling equipment will be properly decontaminated before drilling each boring.

The NMED/OCD will be notified as early as practicable if conditions arise or are encountered that do not allow the advancement of borings to the specified depths or at planned sampling locations. Appropriate actions (e.g., installation of protective surface casing or relocation of borings to a less threatening location) will be taken to minimize any negative impacts from investigative borings. Soil samples will be collected continuously and logged by a qualified geologist or engineer.

The drilling and sampling will be accomplished under the direction of a qualified engineer or geologist who will maintain a detailed log of the materials and conditions encountered in each boring. Both sample information and visual observations of the cuttings and core samples will be recorded on the boring log. Known site features and/or site survey grid markers will be used as references to locate each boring prior to surveying the location as described in Section 4.4. The boring locations will be measured to the nearest foot, and locations will be recorded on a scaled site map upon completion of each boring.

5.2 Soil Sampling

Since the location of the release is known, a judgmental sampling design is appropriate. Borings located along the pipelines will be spaced off the pipeline to avoid hitting the pipeline while drilling

but kept within a maximum of five feet of the pipelines, as possible considering necessary safety concerns. ~~Six~~ Four soil borings are proposed, with one on either side of the excavation (east and west), ~~and the other~~ two borings to the north along the pipeline, and two hand auger borings located closer to the southern limit of the excavation (Figure 9). The slop oil line and the other lines that run together extend below ground approximately 40 feet to the north, where they come above-ground. The two northern borings will be located approximately 20 feet north of the excavation. No soil borings are proposed to the south of the road, as the release only exited the northern end of the culvert. All soil borings will be extended to a minimum depth of six feet below the depth of the adjacent pipelines. If there is screening evidence of impacted soils (e.g., petroleum odor, staining, or elevated photo-ionization detector or a combustible gas indicator readings) at six feet below the pipeline, then the boring will be extended deeper until either there is no evidence of impacts or groundwater is encountered, whichever occurs first.

The decision to use a hand auger vs. a drilling rig will be based on accessibility and health and safety concerns, although most locations are anticipated to be completed using a drilling rig. A decontaminated split-barrel sampler or continuous five-foot core barrel will be used to obtain samples during the drilling of each boring. Soil samples may be collected using decontaminated, hand-held stainless steel sampling device, shelly tube, or thin-wall sampler, or a pre-cleaned disposable sampling device. A portion of the samples will be placed in pre-cleaned, laboratory-prepared sample containers for laboratory chemical analysis. The use of an Encore® Sampler or other similar device will be used during collection of soil samples for VOC analysis. The remaining portions of the sample will be used for logging and field screening as discussed in Section 5.2.1. Sample handling and chain-of-custody procedures will be in accordance with the procedures presented below in Section 5.4.

Discrete soil samples will be collected for laboratory analyses from within the following intervals:

- 1-2' below the bottom depth of the adjacent pipeline (all soil borings);
 - 5-6' below the bottom depth of the adjacent pipeline or the lowermost one foot interval on soil borings penetrating deeper than six feet below the pipeline (all soil borings);
 - from the interval in each soil boring with the greatest apparent degree of contamination based on field screening (only soil borings with observed potential impacts);
 - From the 6" interval at the top of saturation (applicable only to borings that reach saturation); and
 - Any additional intervals as determined based on field screening results.

**RE: APPROVAL WITH MODIFICATION
INVESTIGATION WORK PLAN MAY 17, 2018 SLOP OIL LINE RELEASE
SWMU NO. 3 UNDERGROUND PIPING CURRENTLY IN USE, OCTOBER 2018
WESTERN REFINING SOUTHWEST, INC. – BLOOMFIELD TERMINAL
BLOOMFIELD, NEW MEXICO
EPA ID NO. NMD089416416
HWB-WRB-18-004**

Dear Mr. McCartney:

The New Mexico Environment Department (NMED) has received Western Refining Southwest, Inc., Bloomfield Terminal's (Western) *Investigation Work Plan Underground Slop Pipeline Release – May 18, 2018* (Work Plan) dated October 10, 2018. NMED has reviewed the Work Plan and hereby issues this Approval with the following modifications.

Comment 1

In Section 2 (Background), page 2-3, Western describes the release that occurred from the slop oil pipeline. Provide the following information:

- a. According to the description, Western removed 285 cubic yards of soil but did not report whether liquid was removed from the site. Report the amount of liquid removed from the site in the response letter and the final C-141.

- b. Based on the original e-mailed notifications on May 18, 2019, the release was identified by visual inspection. State whether there were other types of indicators that were used to identify the release in the response letter.
- c. Along with the C-141, several photographs have been provided that showed the area where the release occurred as well as the open trench with the exposed pipelines. However, Western has not provided a scaled figure that includes the dimensions of the open trench or the depth that the soil was excavated. Provide a scaled figure with the dimensions of the open trench with the response letter.
- d. In an e-mail dated June 19, 2018, Western provided results for three composite soil samples and a picture of the open trench. Western did not provide a figure with the locations that the samples were collected. Furthermore, Western did not provide the sample depths or the rationale for the sample locations. Provide a scaled figure with the sample locations as well as discuss the reasons for the selected sample locations in the response letter. Also provide the sample depths in the response letter.

Comment 2

Section 5.2 (Soil Sampling), pages 5-1 to 5-3, Western discusses the soil sampling method and procedures and proposes to collect soil samples from four soil borings "to a minimum depth of six feet below the pipeline or to the vertical extent of any observed impacts." Figure 9 (Sample Location Map) depicts the excavation location and the four proposed soil sample locations. The soil sample locations appear to be too far away from the pipeline on the north side, and it is unclear why the soil sample locations are located so far north of the release site. Propose to include two additional soil sample locations with the following:

- a. The additional soil samples must be collected between the southern limit of the excavation and the two proposed southern soil sample locations depicted on Figure 9. Provide a revised Figure 9 that includes the added sample locations with the response letter.
- b. All soil samples must be collected within three to five feet laterally from the excavation boundary. These soil samples should laterally delineate the extent of the release as well as determine if the release migrated below the pipelines.

Comment 3

Section 5.3 (Groundwater Water Monitoring), page 5-4, Western states that "no groundwater samples are proposed under this Scope of Work." However, Western did not state how long the pipeline may have been leaking. It is possible that the release may have been leaking for some time and may have migrated to groundwater. Furthermore, Table 2 (Ground Water

Analytical Results Summary) did not include monitoring wells MW-30 and MW-44 which are located east of the release. Include data from these two monitoring wells with the report and provide a discussion if the analytical data indicates that the release migrated into the groundwater.

Western must address all comments where a response is required by this Approval with Modifications. A response letter with the required figures must be submitted to NMED on or before **May 15, 2020**.

This approval is based on the information presented in the document as it relates to the objectives of the work identified by NMED at the time of review. Approval of this document does not constitute agreement with all information or every statement presented in the document.

If you have any questions regarding this letter, please contact Leona Tsinnajinnie of my staff at (505) 476-6057.

Sincerely,

Kevin Pierard

Re: Underground Slop Pipeline Release – May 18, 2018
 Western Refining Southwest, Inc. – Bloomfield Terminal
 Oil Conservation Division GW – 001
 EPA ID# NMD089416416
 HWB – WRB-MISC

Dear Mr. Griswold, and Mr. Keiling:

Release Scenario

The release occurred on May 17, 2018 from a below-ground pipeline just north of a culvert under CR 4990. The pipeline was in slop oil service. Details of the release were reported to the Oil Conservation Division (OCD) and the New Mexico Environment Department (NMED) on a C-141 form dated June 1, 2018.

Spill Clean-up

Western Refining has the performed emergency response activities by excavating, identifying the leaking line, repairing the line and removing free liquids /stained soils. Due to safety concerns, excavation was performed using hydro-vacuum truck. All excavated soils (impacted and clean) were disposed properly at an off-site facility. All free liquids were disposed through the facilities' waste water treatment system.

There are 15 pipelines, a high-voltage power line and a fiber-optic communication line in the culvert under the roadway. Damage to any of these lines would cause "major facility destruction". The potential impact would have caused a fuel and crude oil supply disruption for the region. To further complicate matters, the Release occurred in immediate proximity to a San Juan County roadway.

Delineation by excavation to cleanup-levels was not possible due to the following collapse concerns:

- Laterally, the excavation safety constraints are the presence of equipment, roadway, and/or collapse concerns.
- Vertically, the safety constraint is the presence of equipment - several large lines below the bottom of the excavation.

Pipeline Evaluation/Repair

To prevent further occurrences, the pipelines and other utilities have been evaluated and repaired, if necessary. Due to safety concerns and a request from San Juan County, the excavation was backfilled as soon as the pipeline mechanical integrity testing and repairs were completed.

Facility Remediation

Remediation under both OCD and NMED requirements is in progress at the Bloomfield Terminal. This work has been performed under OCD Discharge Permit GW-1 and the NMED Corrective Action Order (Order) dated July 27, 2007. The slop pipeline was previously investigated as part of Group 8 (SMWU 3 Underground Piping Currently in Use). Figure 2 from the Investigation Report is attached for reference. Ground water is monitored regularly and reported to both NMED and OCD on an annual basis. Figures 5 and 7 from the 2018 Annual Report are attached for reference.

Path Forward Proposal

Upon review of the OCD Spill Rules dated August 14, 2018, the aggressive time line is only achievable when soil removal is straightforward and technically practical. Due to excavation limitations, it is not possible to close the slop release in the allotted time (November 12, 2018).

Western Refining proposes to prepare an Investigation Work Plan by October 15, 2018. This plan will be prepared for review of OCD and NMED. The plan will be presented in a similar format to the Group 8 Work Plan.

If you have any questions or need additional information, please feel free to contact me at (915) 534-1483 at your convenience.

Sincerely,

WESTERN REFINING SOUTHWEST, INC.

Subject: RE: Western Refining - Bloomfield Terminal: Pipeline Leak Notification

Vanessa,

Please grant Western Refining an extension to the August 15, 2018 which is 90 days after the spill occurrence.

As you are aware, the release occurred from a below-ground pipeline just north of a culvert under CR 4990. There are 15 pipelines, a high-voltage power line and a fiber-optic communication line in the culvert. To complicate matters, the roadway is in close proximity of the excavation. Damage to any of these lines would cause "major facility destruction".

Spill Clean-up

Western Refining performed emergency response activities by excavating, identifying the leaking line, repairing the line and removing free liquids/stained soils. Delineation by excavation to cleanup-levels was not possible due to collapse concerns. Laterally, the excavation safety constraints are the presence of equipment and/or collapse concerns. Vertically, the safety constraint is the presence of equipment, several large lines below the bottom of the excavation that you witnessed.

Pipeline Evaluation/Repair

To prevent further occurrences, the pipelines and other utilities are being evaluated and repaired, if necessary. This work continues today and should be completed soon. Due to safety concerns, the excavation will be backfilled as soon as practicable.

Moving Forward

The area of the release is regulated by the following:

- NMOCD (Aztec) - Spill Rules (changing soon)
- NMOCD (Santa Fe) - GW-1 Discharge Permit (Release reporting and abatement requirements)
- NMED HWB – Corrective Action Order (SWMU 3 - Underground Piping Currently In Use)

Western Refining will propose a path forward for all of the Stakeholders to review.

Thank you,

Allen S. Hains
Project Manager
Refinery Remediation

Subject: RE: Western Refining - Bloomfield Terminal: Pipeline Leak Notification

Good morning Kelly ,

Conditions of Approval for Western Bloomfield Terminal Release:

- Following the NMOCD Guidelines for Remediation's of Leaks, Spills and Releases the remediation's levels for the soils at Western Bloomfield Terminal are as follows: Site ranking **20** 10 mg/kg Benzene, 50 mg/kg BTEX and 100 mg/kg TPH
 - Western will fully delineate the release both horizontally and vertically. Boreholes that exceeded 100ppm OVM or exhibit heavy staining and/or apparent hydrocarbon impacts will be considered impacted until sampled.
 - Delineation must be completed by July 20, 2018.
 - Provide OCD District III office 24 hour notification prior to sampling.
 - Horizontal delineation of soil impacts must be characterized for the following constituents using the associated laboratory methods: benzene, toluene, ethylbenzene, and total xylenes by either Method 8260 or 8021, total petroleum hydrocarbons by Method 8015 extended range (GRO+DRO+MRO; C6 thru C36). Soil sampling must be both within the impacted area and beyond.
 - Vertical delineation of soil impacts must be characterized for the following constituents using the associated laboratory methods: benzene, toluene, ethylbenzene, and total xylenes by either Method 8260 or 8021, total petroleum hydrocarbons by Method 8015 extended range (GRO+DRO+MRO; C6 thru C36), Vertical characterization samples should be taken at depth intervals no greater than five feet apart. Lithologic description of encountered soils must also be provided. At least ten vertical feet of soils with contaminant concentrations at or below the sites closure standards must be demonstrated as existing above the water table.
 - Composite sampling will not be allowed for delineation
 - Field screening and assessment techniques are acceptable (headspace, titration, EC [include algorithm for validation purposes], EM, etc.), but the sampling and assay procedures must be

clearly defined. Copies of field notes are highly desirable. A statistically significant set of split samples must be submitted for confirmatory laboratory analysis, including the laterally farthest and vertically deepest sets of soil samples. Make sure there are at least two soil samples submitted for laboratory analysis from each borehole or test pit (highest observed contamination and deepest depth investigated).

- Within 30 days of completion of delineation Western will submit to the OCD a delineation report and proposed alternative remediation plan.

Please let me know if you have any questions.

Thank you,

Subject: FW: Western Refining - Bloomfield Terminal: Pipeline Leak Notification

Good Morning Ma'am,

Western Refining would like to provide an up-date regarding the emergency response efforts pertaining to the slop line leak. As of current, the excavation around the leak source areas has not reached to the full extent of the release. The lab report for the latest soil sampling is attached. Western Refining has stopped excavation of the soils due to integrity issues relating to the roadway and exposed pipelines. The attached photo shows the pipelines and the roadway.

Moving forward, Western is in-need of making the excavation safe by backfilling the area later this week, if possible. Western management, including engineering, will develop a strategy to excavate the remaining impacted soil under emergency response, if possible. Please let us know if you have any questions or need any additional information.

Thank you for your time!

Good Afternoon,

Attached is the follow-up initial C-141 documenting the slop line leak at the Bloomfield Terminal. As stated in the report, the source of the leak was identified to be on the north side of County Road 4990. Western Refining is schedule to collect closure samples on Monday, June 3rd, 2018. A representative from NMOCD-Aztec will be on-site to witness the sampling activities. A follow-up C-141 will be submitted following receipt of the sample results for agency review.

If anyone has any questions, please let me know at your convenience.

Thank you for your time!

Sincerely,

Subject: Western Refining - Bloomfield Terminal: Pipeline Leak Notification

Good Afternoon Everyone,

Yesterday afternoon Western Refining – Bloomfield Terminal identified a leak in a pipeline used to transfer water/crude/finished product mixtures from the Terminal Loading/Unloading areas on the south side of County Road 4990 to the on-site Wastewater Treatment System located north of County Road 4990. The line has since been isolated from service and additional investigation efforts are on-going to determine the cause of the leak and extent of impact to the surrounding soils. At this time it is unknown as to the quantity of liquids released from the pipeline. Western Refining has contracted Envirotech to support the on-going field investigation efforts. We will be providing up-dates on progress made in the field as more information becomes available.

If you have any questions in the meantime, please feel free to contact me at your convenience.

Subject: Western Refining Bloomfield Terminal - Liquid Release from Below Ground Pipeline Follow-up Reporting

Good Morning Everyone,

Western Refining is providing a brief up-date of the efforts completed thus far as it pertains to a liquid release from a below ground pipeline located at the Western Refining Bloomfield Terminal originally reported on Friday, May 18th. Excavation crews continued to work through Saturday (May 19th) and will resume field efforts today. We have been able to locate the north end of the culvert which is in-place to protect several Western Refining pipelines that run across County Road 4990. We have not been able to locate the exact location of the line leak, but we suspect the release originated along the section of the slop line that is located inside or within close vicinity to the culvert. Excavation efforts will continue today to develop a clearance area where we can more safely access the entrance of the culvert and further assess the area within the culvert.

Prior to the start of the excavation effort, Operations flushed the section of the slop line that runs from the Terminal to the Tank Farm with clean water to clean-out the line as much as possible. The slop line will remain out-of-service until such time that repairs can be completed. Western Refining will continue to provide up-dates as new information is made available from the field team.

In the meantime, please let me know if you have any questions.

Kelly R. Robinson - Environmental Supervisor

Subject: Western Refining - Bloomfield Terminal: Pipeline Leak Notification

Good Afternoon Everyone,

Yesterday afternoon Western Refining – Bloomfield Terminal identified a leak in a pipeline used to transfer water/crude/finished product mixtures from the Terminal Loading/Unloading areas on the south side of County Road 4990 to the on-site Wastewater Treatment System located north of County Road 4990. The line has since been isolated from service and additional investigation efforts are on-going to determine the cause of the leak and extent of impact to the surrounding soils. At this time it is unknown as to the quantity of liquids released from the pipeline. Western Refining has contracted Envirotech to support the on-going field investigation efforts. We will be providing up-dates on progress made in the field as more information becomes available.

If you have any questions in the meantime, please feel free to contact me at your convenience.

Thank you for your time!

Kelly R. Robinson - Environmental Supervisor

Was a Watercourse Reached? ☐ Yes ☒ No	If YES, Volume Impacting the Watercourse.	

If a Watercourse was Impacted, Describe Fully.*

Describe Cause of Problem and Remedial Action Taken.*

On Thursday, May 17th, the Bloomfield Terminal identified a leak in an underground pipeline used to transfer water/crude/finished product mixtures from the Terminal Loading/Unloading areas on the south side of County Road 4990 to the on-site Wastewater Treatment System located north of County Road 4990. The leak originated from a crack in the elbow pipe joint. Since the pipe is wrapped in insulation, the wrapping deterred the release of liquids to the surrounding soils. The pipeline was evacuated of hydrocarbons using fire water, and all liquids were evacuated from the pipeline using the on-site vacuum truck. All liquids removed from the pipeline were transferred to the on-site wastewater treatment plant. The line remains out-of-service until the repairs to the line are completed and the section of the pipeline is hydro-tested to ensure the integrity of the pipeline is sound.

Describe Area Affected and Cleanup Action Taken.*

Western contracted a hydro-excavator to hydro-excavate all soils around the leak area. A hydro excavator was the only safe method of excavation due to the fact that there exists additional power and product lines within the vicinity of where the leak occurred. A sufficient amount of soils were removed to be able to thoroughly assess an extended section of the pipeline. All hydro-excavated materials were transferred to secondary containment areas on-site for temporary storage. A sample was collected of the excavated materials for waste characterization and waste profile development. Initial preliminary lab results indicate that the excavated soils are non-hazardous. Western is scheduled to collect samples of the excavated area on Monday, June 4th, 2018. A representative from NMOCD-Aztec Office will be on-site to witness the sampling activities for closure.

A follow-up C-141 report will be submitted following the collection of the field samples and receipt of the waste characterization results.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

RE: Investigation Work Plan
Underground Slop Pipeline Release – May 18, 2018
Western Refining Southwest, Inc. - Bloomfield Terminal
EPA ID# NMD089416416 (HWB-WRB-MISC)
Oil Conservation Division GW – 001

Dear Mr. Kieling and Griswold,

Western Refining Southwest, Inc. – Bloomfield Terminal submits the referenced Investigation Work Plan pursuant to New Mexico Environmental Department (NMED) Hazardous Waste Bureau (HWB) Corrective Action Order (Order) dated July 27, 2007 and the Oil Conservation Department (OCD) Discharge Permit (Permit) GW-1.

Remediation at the Bloomfield Terminal is conducted under both the NM Hazardous Waste Act (Order) and NM Water Quality Act (Permit) requirements. The slop pipeline was previously investigated as part of Group 8 (SMWU 3 Underground Piping Currently in Use). This Investigation Work Plan is presented in a similar format to the Group 8 Work Plan.

If you have any questions or need additional information, please feel free to contact me at (915) 534-1483 at your convenience.

Sincerely,

WESTERN REFINING SOUTHWEST, INC.

Executive Summary

The Bloomfield Terminal (former refinery), which is located in the Four Corners Area of New Mexico, has been in operation since the late 1950s. Past inspections by State and federal environmental inspectors have identified locations where releases to the environment may have occurred. These locations are generally referred to as Solid Waste Management Units (SWMUs) or Areas of Concern (AOCs).

Pursuant to the terms and conditions of an Order issued on July 27, 2007 by the New Mexico Environment Department (NMED) to San Juan Refining Company, as owner, and Giant Industries Arizona, Inc., as operator, for the Bloomfield Refinery, this Investigation Work Plan has been prepared to investigate a release from an underground pipeline discovered on May 17, 2018. The pipeline passes beneath County Road 4990, where the release was observed. The pipeline is used to transfer slop oil.

The planned investigation activities include collection of soil samples, which will be analyzed for potential spill-related constituents (e.g., total petroleum hydrocarbons, volatile organic compounds, and semi-volatile organic compounds). The Investigation Work Plan includes specific sampling locations, sample collection procedures, and analytical methods. The scope of the proposed investigation is based on direct field observations of the spill area during the initial emergency response that included removal of all free liquids and heavy impacted soils.

Section 1

Introduction

The Bloomfield Terminal (former refinery) is located immediately south of Bloomfield, New Mexico in San Juan County (Figure 1). The physical address is #50 Road 4990, Bloomfield, New Mexico 87413. The Bloomfield Terminal is located on approximately 263 acres. Bordering the facility is a combination of federal and private properties. Public property managed by the Bureau of Land Management lies to the south. The majority of undeveloped land in the vicinity of the facility is used extensively for oil and gas production and, in some instances, grazing. U.S. Highway 44 is located approximately one-half mile west of the facility. The topography of the main portion of the site is generally flat with steep bluffs to the north where the San Juan River intersects Tertiary terrace deposits.

On July 27, 2007, the New Mexico Environment Department (NMED) issued an Order to San Juan Refining Company and Giant Industries Arizona, Inc. (“Western”) requiring investigation and corrective action at the Bloomfield Refinery. This Investigation Work Plan has been prepared for a release from an underground pipeline discovered on May 17, 2018 and that occurred in the area covered by Solid Waste Management Unit (SWMU) No. 3 Underground Piping Currently in Use. The release notification was documented to the New Mexico Oil Conservation Division (OCD) and the NMED through a C-141 Form, which is included in Appendix A. The location of SWMU No. 3 and the release point are shown on Figure 2. Photographs of the initial excavation to expose the pipeline are included in Appendix B.

The purpose of the site investigation is to determine and evaluate the extent of the pipeline release of contaminants in accordance with 20.4.1.500 New Mexico Administrative Code (NMAC) incorporating 40 Code of Federal Regulations (CFR) Section 264.101. The investigation activities will be conducted in accordance with Section IV of the Order.

Section 2

Background

This section presents background information for the SWMU, including a review of historical waste management and product storage/handling activities to identify the following:

- Type and characteristics of all waste and all potential contaminants handled in the subject SWMUs;
- Known and possible sources of contamination;
- History of releases; and
- Known extent of contamination.

SWMU No. 3 Underground Piping Currently in Use

The majority of the underground piping at the terminal is considered to still be in use even though petroleum refining operations have recently been suspended and the property is currently used as a petroleum terminal. The terminal operations still include most of the same or similar transfer and storage operations of refined products and crude oil that took place during active refining operations. Crude oil is delivered to the terminal at the truck unloading rack and crosses beneath County Road 4990 to storage tanks within the Terminal Tank Farm. Crude oil now leaves the facility via pipeline. Refined product is currently delivered to the facility via a pipeline operated by a third party and trucks, and is transferred to on-site storage tanks through aboveground lines. Product is moved from the storage tanks to the product loading rack via mostly aboveground pipelines with the exception of lines that run beneath County Road 4990 in open culverts and beneath the actual loading rack.

Figure 2 shows the underground lines that are included in SWMU No. 3. It should be noted that in Figure 2 there are very short segments of pipelines shown as underground pipelines in the Tank Farm but in actuality, these are only very short portions of the above ground lines that cross through tank dike walls. There are no documented historical releases from the active underground pipelines.

Previous Investigations in the Area of SWMU No. 3

Previous investigations have identified and delineated impacts to groundwater from historical site operations. Figure 3 shows the distribution of separate phase hydrocarbon (SPH) in the subsurface

based on the apparent thickness of SPH measured in monitoring wells. Most of the areas with underground piping are not present over locations with measureable SPH. There is an accumulation of SPH in MW-61 and MW-66, which is south of County Road 4990 and near some underground pipelines in the area. Dissolved-phase impacts are depicted on Figure 4.

Recent investigations conducted under the Order for SWMU Groups 2, 3, 4, and 5 have included both soil borings and monitoring wells along the SWMU No. 3 underground lines as shown on Figure 2. The analytical results from analyses of these samples are presented in Tables 1 and 2 and were used to supplement analyses conduct pursuant to the previous Investigation Work Plan for Group 8 SWMUs No. 3 and No. 6 that was approved with modifications on June 7, 2011. These existing sample locations include the following:

- Tank Farm - two soil borings (SWMU 15-3 and 15-6) near active underground hydrocarbon lines;
- Product Loading Rack – soil borings SWMU 22-12 and 22-13, monitoring well SWMU 22-15/MW-61, and MW-65;
- Crude Unloading Rack Area – borings/monitoring wells SMWU 22-16/MW-63 and SWMU 24-7/MW-64;
- Fire Training Area – soil borings SWMU 10-1 and 10-2;
- Aeration Basins – monitoring wells MW-55 and MW-56;
- Former South Evaporation Pond – soil borings SWMU 7-1 and 7-3;
- Inactive Landfill – soil borings SWMU 8-6, 8-8, and 8-10, and monitoring well SWMU 8-6A/MW-52; and
- Tank Farm - soil borings SWMU 15-1, 15-2, and 15-3.

The most recent investigation activities included collection and analysis of soil samples for potential site-related constituents beginning on January 25, 2012 and continuing through February 6, 2012. The samples were collected from 27 soil borings, which were completed using hollow-stem augers. At active underground pipelines, soil borings were drilled laterally within 5 feet of the pipeline to reduce the potential for accidentally striking an underground pipeline. The closest soil boring to the location of the recent release is SWMU 3-20 and it was located on the opposite or south side of County Road 4990. Soil samples were collected from depths of 2' - 4', 10.5' – 11.5', and 14.5' – 15.5' and no hydrocarbon constituents were detected above screening levels (Table 3).

Recent Release from Slop Oil Pipeline

The recent release of slop oil was discovered on May 17, 2018 on the north side of County Road 4990. There are 15 pipelines that run through a culvert, which crosses beneath County Road 4990. One line (slop oil line) was identified as having a crack located approximately 10 feet to the north of the County road. The material described as slop oil consists of petroleum products that originate at the truck loading rack and crude oil that originates at the crude oil unloading rack. Small volumes of water may also be contained with the hydrocarbons. The end of the culvert was exposed on both the north and south side of the road and it was determined that no material had been released on the south side of the road.

The pipeline was placed out of serviced and evacuated of hydrocarbons, free liquids removed and the immediate area hydro-excavated to expose the pipeline and the adjacent pipelines. Photos are included in Appendix B. Due to concerns about threatening the mechanical integrity of the adjacent pipelines, which includes pipelines beneath the slop oil line, no additional excavation was possible. The excavation was backfilled due to potential traffic hazards along the immediately adjacent county road.

Prior to backfilling, composite soil samples were collected from the north and west sidewalls and the bottom of the excavation. The composite samples were a five part composite from each surface as per OCD direction. The samples were analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) and total petroleum hydrocarbons (TPH). The results are summarized in Table 4 along with potential soil screening levels and the analytical report is included in Appendix C. Concentrations of individual constituents and TPH were both found to exceed screening levels. The removed soils were analyzed and characterized for off-site disposal. On June 12, 2018, 205 cubic yards of soil were transported off-site and on June 13, 2018, 80 cubic yards were transported off-site for disposal. The analyses and waste manifest are included in Appendix C.

Section 3

Site Conditions

The surface and subsurface conditions that could affect the fate and transport of any contaminants are discussed below. This information is based on recent visual observations and historical subsurface investigations.

3.1 Surface Conditions

Regionally, the surface topography slopes toward the floodplain of the San Juan River, which runs along the northern boundary of the terminal complex. To the south of the terminal, the drainage is to the northwest. North of the terminal, across the San Juan River, surface water flows in a southeasterly direction toward the San Juan River. The portion of the terminal property, where the majority of the underground piping is located, is generally of low relief with an overall northwest gradient of approximately 0.02 ft/ft. The terminal sits on an alluvial floodplain terrace deposit and there is a steep bluff (approx. drop of 90 feet) at the northern boundary of the terminal where the San Juan River intersects the floodplain terrace, which marks the southern boundary of the floodplain.

There are two locally significant arroyos, one immediately east and another immediately west of the terminal. No underground piping crosses either of these arroyos. These arroyos collect most of the surface water flows in the area, thus significantly reducing surface water flows across the terminal. A minor drainage feature is located on the eastern portion of the terminal, where the former Landfill Pond (SWMU No. 9) was located and there are several steep arroyos along the northern terminal boundary that capture local surface water flows and minor groundwater discharges.

The terminal complex is bisected by County Rd #4990 (Sullivan Road), which runs east-west. The process units and wastewater treatment systems are located north of the county road. The crude oil and product loading racks, LPG storage tanks and loading racks, maintenance buildings/90-day storage area, pipeline offices, transportation truck shop, and the Class I injection well are located south of the county road. The underground piping is present across the terminal with the majority of the pipelines (i.e., wastewater lines) running near the perimeter of the property. There is very little vegetation throughout these areas with most surfaces composed of concrete, asphalt, or gravel. The land surface near the underground piping is primarily bare soil with gravel or asphalt roads. The

area between the terminal and the San Juan River does have limited vegetation on steep slopes that do not support dense vegetation.

3.2 Subsurface Conditions

Numerous soil borings and monitoring wells have been completed across the terminal property during previous site investigations and installation of the slurry wall, which runs along the northern and western terminal boundary. Based on the available site-specific and regional subsurface information, the site is underlain by the Quaternary Jackson Lake terrace deposits, which unconformably overlie the Tertiary Nacimiento Formation. The Jackson Lake deposits consist of fine grained sand, silt and clay that grades to coarse sand, gravel and cobble size material closer to the contact with the Nacimiento Formation. The Jackson Lake Formation is over 40 feet thick near the southeast portion of the site and generally thins to the northwest toward the San Juan River. The Nacimiento Formation is primarily composed of fine grained materials (e.g., carbonaceous mudstone/claystone with interbedded sandstones) with a reported local thickness of approximately 570 feet (Groundwater Technology Inc., 1994).

Figures 5, 6 and 7 present cross-sections of the shallow subsurface based on borings logs from on-site monitoring well completions. The uppermost aquifer is under water table conditions and occurs within the sand and gravel deposits of the Jackson Lake Formation. The Nacimiento Formation functions as an aquitard at the site that prevents contaminants from migrating to deeper aquifers. The potentiometric surface as measured in August 2017 is presented as Figure 8 and shows the groundwater flowing to the northwest across the area of SWMU No. 3. The depth to groundwater varies from approximately 30 feet in the southern portion of the site near the wastewater line, which runs to the evaporation ponds and injection well, to less than 15 feet in the northern portion of the site where the wastewater discharge line runs along the northern boundary of the tank farm.

One particular characteristic of the subsurface that may affect the potential for releases from underground piping is the corrosivity of the soils. The corrosion of metals (e.g., buried steel piping) in the subsurface environment is caused by moisture, pH, redox potential, microbes in soils, and soil type (Ekine and Emujakporue, 2010). A review of this list of attributes and subsurface conditions within the subject area of investigation does not reveal any potential obvious areas with soils likely to be more corrosive in any particular location, with the possible exception of locations with higher moisture content. All of the underground piping lies within the Jackson Lake Formation deposits, which is predominated by quartzose sand and silt deposits. The soils developed from the Jackson

Lake Formation parent material in the area of investigation are all within the same soils map unit (i.e., the Doak-Avalon association) and thus the identifiable soil properties (e.g., pH) based on available government soil surveys are anticipated to be similar throughout the area of investigation. The underground pipelines are anticipated to be well above the depth of saturation.

Section 4

Scope of Services

4.1 Anticipated Activities

Pursuant to Section IV of the Order, a scope of services has been developed to determine and evaluate the presence, nature, extent, fate, and transport of contaminants resulting from the release of slop oil discovered on May 17, 2018. To accomplish this objective soil samples will be collected in the area of the release. Four soil borings are proposed to be drilled to a minimum depth of six feet below the pipeline or to the vertical extent of any observed impacts, whichever is deeper. Soil borings will be installed and samples collected as discussed in Section 5.2.

4.2 Background Information Research

Documents containing the results of previous investigations and subsequent routine groundwater monitoring data from monitoring wells were reviewed to facilitate development of this work plan. The previously collected data provide detailed information on the overall subsurface conditions, including hydrogeology and contaminant distribution within groundwater on a site-wide basis.

4.3 Collection and Management of Investigation Derived Waste

Drill cuttings, excess sample material and decontamination fluids, and all other investigation derived waste (IDW) associated with soil borings will be contained and characterized using methods based on the boring location, boring depth, drilling method, and type of contaminants suspected or encountered. All decontamination water will be disposed in the terminal wastewater treatment system upstream of the API Separator. An IDW management plan is included as Appendix D.

4.4 Surveys

The horizontal coordinates and elevation of each boring and the locations of all other pertinent structures will be determined by a registered New Mexico professional land surveyor in accordance with the State Plane Coordinate System (NMSA 1978 47-1-49-56 (Repl. Pamp. 1993)). The surveys will be conducted in accordance with Sections 500.1 through 500.12 of the Regulations and Rules of the Board of Registration for Professional Engineers and Surveyors Minimum Standards for Surveying in New Mexico. Horizontal positions will be measured to the nearest 0.1-ft and vertical elevations will be measured to the nearest 0.01-ft.

Section 5

Investigation Methods

The purpose of the site investigation is to determine and evaluate the presence, nature, and extent of releases of contaminants. Guidance on selecting and developing sampling plans as provided in *Guidance for Choosing a Sampling Design for Environmental Data Collection* (EPA, 2000) was utilized to select the appropriate sampling strategy.

5.1 Drilling Activities

Soil borings will be drilled using either hollow-stem auger or if necessary, air rotary methods including ODEX. The preferred method will be hollow-stem auger to increase the ability to recover undisturbed samples and potential contaminants. Shallow soil samples may be collected using a hand auger until the boring has cleared any underground utilities. The drilling equipment will be properly decontaminated before drilling each boring.

The NMED/OCD will be notified as early as practicable if conditions arise or are encountered that do not allow the advancement of borings to the specified depths or at planned sampling locations. Appropriate actions (e.g., installation of protective surface casing or relocation of borings to a less threatening location) will be taken to minimize any negative impacts from investigative borings. Soil samples will be collected continuously and logged by a qualified geologist or engineer.

The drilling and sampling will be accomplished under the direction of a qualified engineer or geologist who will maintain a detailed log of the materials and conditions encountered in each boring. Both sample information and visual observations of the cuttings and core samples will be recorded on the boring log. Known site features and/or site survey grid markers will be used as references to locate each boring prior to surveying the location as described in Section 4.4. The boring locations will be measured to the nearest foot, and locations will be recorded on a scaled site map upon completion of each boring.

5.2 Soil Sampling

Since the location of the release is known, a judgmental sampling design is appropriate. Borings located along the pipelines will be spaced off the pipeline to avoid hitting the pipeline while drilling but kept within a maximum of five feet of the pipelines, as possible considering necessary safety

concerns. Four soil borings are proposed, with one on either side of the excavation (east and west) and the other two borings to the north along the pipeline (Figure 9). The slop oil line and the other lines that run together extend below ground approximately 40 feet to the north, where they come above-ground. The two northern borings will be located approximately 20 feet north of the excavation. No soil borings are proposed to the south of the road, as the release only exited the northern end of the culvert. All soil borings will be extended to a minimum depth of six feet below the depth of the adjacent pipelines. If there is screening evidence of impacted soils (e.g., petroleum odor, staining, or elevated photo-ionization detector or a combustible gas indicator readings) at six feet below the pipeline, then the boring will be extended deeper until either there is no evidence of impacts or groundwater is encountered, whichever occurs first.

The decision to use a hand auger vs. a drilling rig will be based on accessibility and health and safety concerns, although most locations are anticipated to be completed using a drilling rig. A decontaminated split-barrel sampler or continuous five-foot core barrel will be used to obtain samples during the drilling of each boring. Soil samples may be collected using decontaminated, hand-held stainless steel sampling device, shelly tube, or thin-wall sampler, or a pre-cleaned disposable sampling device. A portion of the samples will be placed in pre-cleaned, laboratory-prepared sample containers for laboratory chemical analysis. The use of an Encore® Sampler or other similar device will be used during collection of soil samples for VOC analysis. The remaining portions of the sample will be used for logging and field screening as discussed in Section 5.2.1. Sample handling and chain-of-custody procedures will be in accordance with the procedures presented below in Section 5.4.

Discrete soil samples will be collected for laboratory analyses from within the following intervals:

- 1-2' below the bottom depth of the adjacent pipeline (all soil borings);
- 5-6' below the bottom depth of the adjacent pipeline or the lowermost one foot interval on soil borings penetrating deeper than six feet below the pipeline (all soil borings);
- from the interval in each soil boring with the greatest apparent degree of contamination based on field screening (only soil borings with observed potential impacts);
- From the 6" interval at the top of saturation (applicable only to borings that reach saturation); and
- Any additional intervals as determined based on field screening results.

Quality Assurance/Quality Control (QA/QC) samples will be collected to monitor the validity of the soil sample collection procedures as follows:

- Field duplicates will be collected at a rate of 10%, with a minimum of one field duplicate being collected; and
- Equipment rinsate blanks will be collected at a rate of one per day, by pouring distilled water over decontaminated sampling equipment (e.g., split spoon samplers).

5.2.1 Soil Sample Field Screening and Logging

Samples obtained from the borings will be screened in the field on 2.5 foot intervals for evidence of contaminants. Field screening results will be recorded on the exploratory boring logs and will be used to aid in the selection of soil samples for laboratory analysis. The primary screening methods include: (1) visual examination, (2) olfactory examination, and (3) headspace vapor screening for volatile organic compounds. Additional screening for site- or release-specific characteristics such as pH or for specific compounds using field test kits may be conducted where appropriate.

Visual screening includes examination of soil samples for evidence of staining caused by petroleum-related compounds or other substances that may cause staining of natural soils such as elemental sulfur or cyanide compounds. Headspace vapor screening targets volatile organic compounds and involves placing a soil sample in a foil sealed container allowing space for ambient air. The container will be sealed and then shaken gently to expose the soil to the air trapped in the container. The sealed container will be allowed to rest for a minimum of 5 minutes while vapors equilibrate. Vapors present within the headspace will then be measured by inserting the probe of the instrument in a small opening through the foil. The maximum value and the ambient air temperature will be recorded on the field boring log for each sample.

The monitoring instruments will be calibrated each day to the manufacturer's standard for instrument operation. A photo-ionization detector (PID) equipped with a 10.6 or higher electron volt (eV) lamp or a combustible gas indicator will be used for VOC field screening. Field screening results may be site- and boring-specific and the results may vary with instrument type, the media screened, weather conditions, moisture content, soil type, and type of contaminant. Conditions capable of influencing the results of field screening will be recorded on the field logs.

The physical characteristics of the samples (such as mineralogy, ASTM soil classification, moisture content, texture, color, presence of stains or odors, and/or field screening results), depth where each

sample was obtained, method of sample collection, and other observations will be recorded in the field log by a qualified geologist or engineer. Detailed logs of each boring will be completed in the field by a qualified engineer or geologist. Additional information, such as the presence of water-bearing zones and any unusual or noticeable conditions encountered during drilling, will be recorded on the logs.

5.3 Groundwater Water Monitoring

Groundwater has been sampled at monitoring wells located at the terminal from as early as 1984. Based on the fact that there are numerous wells that provide information on water quality across much of the subject investigation area, no groundwater samples are proposed under this Scope of Work.

5.4 Sample Handling

At a minimum, the following procedures will be used at all times when collecting samples during investigation, corrective action, and monitoring activities:

1. Neoprene, nitrile, or other protective gloves will be worn when collecting samples. New disposable gloves will be used to collect each sample;
2. All samples collected of each medium for chemical analysis will be transferred into clean sample containers supplied by the project analytical laboratory with the exception of soil, rock, and sediment samples obtained in Encore® samplers. Sample container volumes and preservation methods will be in accordance with the most recent standard EPA and industry accepted practices for use by accredited analytical laboratories. Sufficient sample volume will be obtained for the laboratory to complete the method-specific QC analyses on a laboratory-batch basis; and
3. Sample labels and documentation will be completed for each sample following procedures discussed below. Immediately after the samples are collected, they will be stored in a cooler with ice or other appropriate storage method until they are delivered to the analytical laboratory. Standard chain-of-custody procedures, as described below, will be followed for all samples collected. All samples will be submitted to the laboratory soon enough to allow the laboratory to conduct the analyses within the method holding times. At a minimum, all samples will be submitted to the laboratory within 48 hours after their collection.

Chain-of-custody and shipment procedures will include the following:

1. Chain-of-custody forms will be completed at the end of each sampling day, prior to the transfer of samples off site.
2. Individual sample containers will be packed to prevent breakage and transported in a sealed cooler with ice or other suitable coolant or other EPA or industry-wide accepted method. The drainage hole at the bottom of the cooler will be sealed and secured in case of sample container leakage.
3. Each cooler or other container will be delivered directly to the analytical laboratory.
4. Glass bottles will be separated in the shipping container by cushioning material to prevent breakage.
5. Plastic containers will be protected from possible puncture during shipping using cushioning material.
6. The chain-of-custody form and sample request form will be shipped inside the sealed storage container to be delivered to the laboratory.
7. Chain-of-custody seals will be used to seal the sample-shipping container in conformance with EPA protocol.
8. Signed and dated chain-of-custody seals will be applied to each cooler prior to transport of samples from the site.
9. Upon receipt of the samples at the laboratory, the custody seals will be broken, the chain-of-custody form will be signed as received by the laboratory, and the conditions of the samples will be recorded on the form. The original chain-of-custody form will remain with the laboratory and copies will be returned to the relinquishing party.
10. Copies of all chain-of-custody forms generated as part of sampling activities will be maintained on-site.

5.5 Decontamination Procedures

The objective of the decontamination procedures is to minimize the potential for cross-contamination. A designated decontamination area will be established for decontamination of drilling equipment and reusable sampling equipment. The drilling rig will be decontaminated prior to entering the site or unit. Drilling equipment or other exploration equipment that may come in contact with the borehole will be decontaminated by high pressure washing prior to drilling each new boring.

Sampling or measurement equipment, including but not limited to stainless steel sampling tools and split-barrel or core samplers, will be decontaminated in accordance with the following procedures or other methods approved by the Department before each sampling attempt or measurement:

1. Brush equipment with a wire or other suitable brush, if necessary or practicable, to remove large particulate matter;
2. Rinse with potable tap water;
3. Wash with nonphosphate detergent or other detergent approved by the Department (examples include Fantastik™, Liqui-Nox®);
4. Rinse with potable tap water; and
5. Double rinse with deionized water.

All decontamination solutions will be collected and stored temporarily as described in Section 4.3. Decontamination procedures and the cleaning agents used will be documented in the daily field log.

5.6 Field Equipment Calibration Procedures

Field equipment requiring calibration will be calibrated to known standards, in accordance with the manufacturers' recommended schedules and procedures. At a minimum, calibration checks will be conducted daily, or at other intervals approved by the Department, and the instruments will be recalibrated, if necessary. Calibration measurements will be recorded in the daily field logs. If field equipment becomes inoperable, its use will be discontinued until the necessary repairs are made. In the interim, a properly calibrated replacement instrument will be used.

5.7 Documentation of Field Activities

Daily field activities, including observations and field procedures, will be recorded in a field log book. The original field forms will be maintained at the facility. Copies of the completed forms will be maintained in a bound and sequentially numbered field file for reference during field activities. Indelible ink will be used to record all field activities. Photographic documentation of field activities will be performed, as appropriate. The daily record of field activities will include the following:

1. Site or unit designation;
2. Date;
3. Time of arrival and departure;
4. Field investigation team members including subcontractors and visitors;
5. Weather conditions;

-
-
6. Daily activities and times conducted;
 7. Observations;
 8. Record of samples collected with sample designations and locations specified;
 9. Photographic log, as appropriate;
 10. Field monitoring data, including health and safety monitoring;
 11. Equipment used and calibration records, if appropriate;
 12. List of additional data sheets and maps completed;
 13. An inventory of the waste generated and the method of storage or disposal; and
 14. Signature of personnel completing the field record.

5.8 Chemical Analyses

All samples collected for laboratory analysis will be submitted to an accredited laboratory. The laboratory will use the most recent standard EPA and industry-accepted analytical methods for target analytes as the testing methods for each medium sampled. Chemical analyses will be performed in accordance with the most recent EPA standard analytical methodologies and extraction methods.

All soil samples will be analyzed by the following methods:

- SW-846 Method 8260 volatile organic compounds;
- SW-846 Method 8270 semi-volatile organic compounds; and
- SW-846 Method 8015B gasoline range (C5-C10), diesel range (>C10-C28), and motor oil range (>C28-C36) organics.

5.9 Data Quality Objectives

The Data Quality Objectives (DQOs) were developed to ensure that newly collected data are of sufficient quality and quantity to address the projects goals, including Quality Assurance/Quality Control (QA/QC) issues (EPA, 2006). The project goals are established in the Order and are to determine and evaluate the presence, nature, and extent of releases of contaminants at specified SWMUs. The type of data required to meet the project goals includes chemical analyses of soil to determine if there has been a release of contaminants at the individual SWMUs.

The quantity of data is SWMU specific and based on the historical operations at individual locations. The quality of data required is consistent across locations and is specified in Section VIII.D.7.c of the

Order. In general, method detection limits should be 20% or less of the applicable background levels, cleanup standards and screening levels.

Additional DQOs include precision, accuracy, representativeness, completeness, and comparability. Precision is a measurement of the reproducibility of measurements under a given set of circumstances and is commonly stated in terms of standard deviation or coefficient of variation (EPA, 1987). Precision is also specific to sampling activities and analytical performance. Sampling precision will be evaluated through the analyses of duplicate field samples and laboratory replicates will be utilized to assess laboratory precision.

Accuracy is a measurement in the bias of a measurement system and may include many sources of potential error, including the sampling process, field contamination, preservation, handling, sample matrix, sample preparation, and analysis techniques (EPA, 1987). An evaluation of the accuracy will be performed by reviewing the results of field/trip blanks, matrix spikes, and laboratory QC samples.

Representativeness is an expression of the degree to which the data accurately and precisely represent the true environmental conditions. Sample locations and the number of samples have been selected to ensure the data is representative of actual environmental conditions. Based on SWMU specific conditions, this may include either biased (i.e., judgmental) locations/depths or unbiased (systematic grid samples) locations, as discussed in Section 5.2 for soils.

Completeness is defined as the percentage of measurements taken that are actually valid measurements, considering field QA and laboratory QC problems. EPA Contract Laboratory Program (CLP) data has been found to be 80-85% complete on a nationwide basis and this has been extrapolated to indicate that Level III, IV, and V analytical techniques will generate data that are approximately 80% complete (EPA, 1987). As an overall project goal, the completeness goal is 85%; however, some samples may be critical base on location or field screening results and thus a sample-by-sample evaluation will be performed to determine if the completeness goals have been obtained.

Comparability is a qualitative parameter, which expresses the confidence with which one data set can be compared to another. Industry standard sample collection techniques and routine EPA analytical methods will be utilized to help ensure data are comparable to historical and future data. Analytical results will be reported in appropriate units for comparison to historical data and cleanup levels.

Section 6

Schedule

This investigation Work Plan will be implemented in accordance with the schedules as specified by NMED and OCD in the Work Plan approval letters.

NATURE OF RELEASE

Type of Release: Crude Oil/Water/Product Mixture	Volume of Release 7 bbls hydrocarbons	Volume Recovered: All standing liquids were recovered.
Source of Release: Crack in the slop line located adjacent/north of county road 4990	Date and Hour of Occurrence: 5/17/2018	Date and Hour of Discovery 5/17/2018 at approximately 6:15am
Was Immediate Notice Given? ☒ Yes ☐ No ☐ Not Required	If YES, To Whom? 5/18/2018 to Carl Chavez – NMOCD Santa FE, Vanessa Field- NMOCD, Cory Smith – NMOCD, Leona Tsinnajinnie – NMED-HWB	
By Whom? Kelly Robinson	Date and Hour 5/18/2018 at 3:09pm	
Was a Watercourse Reached? ☐ Yes ☒ No	If YES, Volume Impacting the Watercourse.	

If a Watercourse was Impacted, Describe Fully.*

Describe Cause of Problem and Remedial Action Taken.*

On Thursday, May 17th, the Bloomfield Terminal identified a leak in an underground pipeline used to transfer water/crude/finished product mixtures from the Terminal Loading/Unloading areas on the south side of County Road 4990 to the on-site Wastewater Treatment System located north of County Road 4990. The leak originated from a crack in the elbow pipe joint. Since the pipe is wrapped in insulation, the wrapping deterred the release of liquids to the surrounding soils. The pipeline was evacuated of hydrocarbons using fire water, and all liquids were evacuated from the pipeline using the on-site vacuum truck. All liquids removed from the pipeline were transferred to the on-site wastewater treatment plant. The line remains out-of-service until the repairs to the line are completed and the section of the pipeline is hydro-tested to ensure the integrity of the pipeline is sound.

Describe Area Affected and Cleanup Action Taken.*

Western contracted a hydro-excavator to hydro-excavate all soils around the leak area. A hydro excavator was the only safe method of excavation due to the fact that there exists additional power and product lines within the vicinity of where the leak occurred. A sufficient amount of soils were removed to be able to thoroughly assess an extended section of the pipeline. All hydro-excavated materials were transferred to secondary containment areas on-site for temporary storage. A sample was collected of the excavated materials for waste characterization and waste profile development. Initial preliminary lab results indicate that the excavated soils are non-hazardous. Western is scheduled to collect samples of the excavated area on Monday, June 4th, 2018. A representative from NMOCD-Aztec Office will be on-site to witness the sampling activities for closure.

A follow-up C-141 report will be submitted following the collection of the field samples and receipt of the waste characterization results.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

RE: Slop line Waste Characterization

OrderNo.: 1805C15

Dear Kelly Robinson:

Hall Environmental Analysis Laboratory received 1 sample(s) on 5/23/2018 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. In order to properly interpret your results, it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0901

Sincerely,

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.
T8	Sample(s) received past/too close to holding time expiration.

RE: Slop Line Area

OrderNo.: 1806129

Dear Kelly Robinson:

Hall Environmental Analysis Laboratory received 3 sample(s) on 6/5/2018 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. In order to properly interpret your results, it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0901

Sincerely,

Appendix D

Investigation Derived Waste (IDW) Management

Plan

IDW Management Plan

All IDW will be properly characterized and disposed of in accordance with all federal, State, and local rules and regulations for storage, labeling, handling, transport, and disposal of waste. If soils are found to be non-hazardous and concentrations of constituents are less than the NMED residential soil screening levels, then soils may be reused on-site pursuant to the approval of the NMED. The IDW may be characterized for disposal based on the known or suspected contaminants potentially present in the waste. It is assumed that there are no listed wastes present in environmental media at any of the planned investigation areas.

A dedicated decontamination facility will be setup prior to any sample collection activities. The decontamination facility will be designed so as to capture and contain all decontamination fluids (e.g., wash water and rinse water) and foreign materials washed off the sampling equipment. The fluids will be pumped directly into suitable storage containers (e.g., labeled 55-gallon drums), which will be located at satellite accumulation areas until the fluids are disposed in the terminal wastewater treatment system upstream of the API separator. The solids captured in the decontamination facility will be shoveled into 55-gallon drums and stored at the designated satellite accumulation area pending proper waste characterization for off-site disposal.

Drill cuttings generated during installation of soil borings will be placed directly into 55-gallon drums and staged in the satellite accumulation area pending results of the waste characterization sampling. The portion of soil cores, which are not retained for analytical testing, will be placed into the same 55-gallon drums used to store the associated drill cuttings.

The solids (e.g., drill cuttings and used soil cores) will be characterized by testing to determine if there are any hazardous characteristics in accordance with 40 Code of Federal Regulations (CFR) Part 261. This includes tests for ignitability, corrosivity, reactivity, and toxicity. If the materials are not characteristically hazardous, then further testing will be performed pursuant to the requirements of the facility to which the materials will be transported. Depending upon the results of analyses for individual investigation soil samples, additional analyses may include TPH and polynuclear aromatic hydrocarbons.

All miscellaneous waste materials (e.g., discarded gloves, packing materials, etc.) will be placed into the terminal's solid waste storage containers for off-site disposal.
