Artesia Pit Closure Report

1.0 Introduction

Duke Energy Field Services LP (DEFS) retained Cordilleran Compliance Services, Inc. (Cordilleran) to prepare a Work Plan for the closure of a waste disposal pit located on land owned by DEFS at the Artesia Gas Plant (the plant). The Work Plan was submitted to, and approved by, the New Mexico Oil Conservation Division (OCD) on July 3, 2002. The following discussion summarizes the results of the pit closure activities and presents conclusions and recommendations.

The plant is located approximately 20 miles north of Carlsbad and 14 miles east of Artesia, New Mexico in Eddy County and is situated along the west side of County Road 206. The legal description is the SE $\frac{1}{4}$ of Section 7, Township 18 South, Range 28 East of the Sixth Principal Meridian. Figure 1 shows the location of plant. The field activities for the project, as discussed in the Work Plan, consisted of the following tasks:

1. Developing a closure Work Plan for submittal to the OCD;
2. Waste identification/characterization and profiling;
3. Waste handling/segregation and temporary storage;
4. Waste transportation and disposal;
5. Pit closure soil sampling; and
6. Site restoration.

The results of a preliminary waste characterization investigation conducted on June 6, 2002, indicated that the pit measured approximately 220 feet long by 30 feet wide. The south end of the pit was open and partially full of debris and the north end was buried. The pit was used since the 1950's for the disposal of a variety of waste materials generated at the plant including inert construction debris (concrete and wood), scrap metal (pipe, valves, and rebar), exploration and production (E&P) exempt materials, cooling tower debris, used filter socks, molecular sieve beads, paper and plastic. The ultimate goal of this project was to close the pit in accordance with OCD regulations.

1.1 General Site Hydrogeology

Eddie County is located in the Great Plains Physiographic Province. The climate of the region is characterized as semi-arid and receives approximately 15 inches of precipitation per year. The United States Geologic Survey (USGS) Hydrogeologic Atlas of the United States indicates that the site is underlain by Permian and Pennsylvanian age sedimentary rocks (predominantly carbonates). The Roswell Basin is the predominant aquifer in the area and exists within the floodplain of the Pecos River valley located to the west of the plant. There are no identified aquifers beneath the plant area; however, the depth to groundwater is

Artesia Pit Closure Report

reported to be less than 50 feet below ground surface (bgs). The site elevation is approximately 3,610 feet above mean sea level.

1.2 Registered Water Wells and Surface Water

Cordilleran contacted Mr. Johnny Hernandez with the New Mexico State Engineers Office in Roswell, New Mexico. According to Mr. Hernandez, there are no registered water wells located within a one-mile radius of the plant. There is a livestock well with a windmill located 250 feet to the west of the pit. This livestock well is shown on Figure 1 which is a copy of the 1955 USGS Red Lake, New Mexico 7.5 Minute Topographic Quadrangle. The nearest surface water feature is Chalk Bluff Draw, an intermittent stream, located 4,500 feet west of the pit.

1.3 Soil Remediation Levels

The OCD has published guidelines for the closure of unlined surface impoundments (pits) that establish remediation action levels for soil based on site-specific characteristics. The document, *Unlined Surface Impoundment Closure Guidelines (February 1993)*, assigns numeric values to three ranking criteria:

- 1) Depth to groundwater (the depth to groundwater from the base of the pit or contaminated soil is less than 50 feet therefore the value is 20);
- 2) Wellhead protection area (distance from a water source or private domestic water source is less than 1,000 feet from a water source therefore the value is 20); and
- 3) Distance to surface water body (the distance is greater than 1,000 feet therefore the value is 0).

The total numerical score based on the above three criteria is 40 resulting in a recommended remediation level in soil of the following:

- 10 parts per million (ppm) benzene;
- 50 ppm total benzene, toluene, ethyl benzene, and xylenes; and
- 100 ppm total petroleum hydrocarbons.

The recommended remediation levels described above were used to determine when closure was achieved. The following sections present the procedures and results of the pit closure activities.

Artesia Pit Closure Report

2.0 Field Activities for Pit Closure

This section of the work plan describes the field activities and methods that were used for the closure of the waste disposal pit at the plant. The waste characterization phase was completed on June 6, 2002. The remaining phases of the project were completed during July 9 through July 16, 2002. Appendix A contains the photographic log of the closure activities. The laboratory analytical methods used for the waste characterization and clean up confirmation samples are provided in the sections that address those activities. All of the work activities were conducted according to the project Health and Safety Plan.

2.1 Waste Identification/Characterization and Profiling

The objectives of the preliminary investigation were to identify the contents of the waste in the pit and to collect representative waste characterization samples for laboratory analysis. Three composite soil samples were collected from material that was removed from three backhoe trenches excavated into the open and covered end of the pit. The locations of these three trenches, TP-1 through TP-3, are shown on Figure 2. These soil samples were submitted to the Environmental Lab of Texas in Midland, Texas following chain-of-custody protocol for analysis of the following parameters by the stated methods:

- Total petroleum hydrocarbon (TPH) gasoline range organics (GRO-C₆ to C₁₂) by EPA method 8015M;
- TPH diesel range organics (DRO-C₁₂ to C₃₅) by EPA method 8015M;
- Benzene, toluene, ethyl benzene, xylenes (BTEX) by EPA method 8021B;
- 8 total RCRA metals by EPA SW-846; and
- TCLP metals for chromium (which exhibited a high total concentration) by EPA SW-846.

The results of the preliminary site investigation indicated that the pit measured approximately 220 feet long by 30 feet wide. The southern end of the pit was open and partially full of debris and the northern end was buried (covered with native soil). The pit dimensions during closure activities were determined to be 120' by 30' by 14' in depth (in the south open pit area) and 85' by 40' by 20' (in the covered north area of the pit). Inspection of material excavated from the backhoe trenches and the material in the open section of the pit indicated that the following waste was present: inert construction debris (concrete and wood); scrap metal (pipe, valves, rebar); E&P-exempt wastes; cooling tower debris; used filter socks; molecular sieve beads; paper and plastic; hydrocarbon-impacted soil and empty 5-gallon plastic buckets.

Artesia Pit Closure Report

Three composite waste characterization samples were collected from the backhoe trenches. Two of the samples, ARP-WCS-01 and ARP-WCS-02, were collected from the closed section of pit and sample ARP-WCS-03 was collected from the open section of the pit. Review of the laboratory data summarized in Table 1, indicates that the samples collected are characterized as non-hazardous solid waste. A copy of the laboratory analytical results is attached to this report in Appendix B. It should be noted that the total TPH concentrations detected in the three waste characterization samples ranged from 13.3 milligrams per kilogram (mg/kg) to 25.8 mg/kg. Additionally, the metals analysis from the waste characterization sample collected from the open section of the pit, sample ARP-WCS-03, had an elevated total chromium concentration of 790 mg/kg. This sample was also submitted for TCLP analysis with a resultant concentration of 0.027 milligram per liter (mg/L) indicating that it was not characterized as hazardous.

The waste characterization data was used to prepare a waste profile for the disposal of the waste at the Lea Land, Inc. Carlsbad, New Mexico Landfill, which is permitted by the New Mexico Environment Department (NMED). Lea Land, Inc. reviewed and approved the waste profile. Copies of the waste characterization profile and correspondence with Lea Land are contained in Appendix C.

2.2 Waste Handling, Segregation and Temporary Storage

All of the waste materials observed in the pits consisted of common non-hazardous solid waste and construction debris. The wastes were excavated from the pit and placed in a staging area prior to being loaded for transportation. A small quantity (approximately 20 cubic yards) of clean concrete was separated from the waste and buried onsite in the excavation. There were no indications of potentially hazardous materials (asbestos containing materials, polychlorinated biphenyls, paint, or pesticides) observed as the materials were removed from the pit. Scrap piping and metal were screened for naturally occurring radioactive materials (NORM) using a Ludlum Instruments Meter with an alpha, beta, gamma pancake detector.

2.3 Waste Transportation and Disposal

All of the waste excavated from the south and north end of the pit was loaded into tractor-trailer trucks and transported to the Lea Land Landfill for disposal. Approximately 2,000 cubic yards of waste were removed from the pit for disposal. Appendix D contains copies of the waste manifests.

2.4 Pit Closure Soil Sampling

After the waste materials were removed from the pit, samples of the soil from the bottom and sidewalls of the pit were collected and submitted for laboratory analysis to confirm that all regulated materials have been removed and disposed. Representatives from the OCD were

Artesia Pit Closure Report

present to observe the closure sampling techniques utilized during the sampling conducted at the south end of the pit. A total of 12 confirmation samples were collected from the base and sidewalls of the south end of the pit on July 10, 2002 and an additional 12 closure samples were collected from the north end of the pit on July 11, 2002. There was no evidence of staining or odors from the soil in the base and sidewalls of the pit excavation after the removal of the waste materials. The sample locations were marked with a survey stake for future identification. A representative split of each sample was placed in a zip lock bag for volatile organic headspace screening using a calibrated photoionization detector (PID). None of the closure soil samples exhibited a PID reading greater than the background reading of 3 ppm.

The soil closure samples were placed in 4-ounce glass jars, labeled, placed on ice in a sample cooler, and were submitted to The Environmental Lab of Texas, located in Midland, Texas following standard chain-of-custody procedures. The laboratory analytical methods used for the confirmation closure samples were from the EPA SW-846 standard methods manual as specified by the OCD.

The specific laboratory analyses requested for the confirmation samples were determined based on the types of waste materials that were removed from that portion of the pit. The south end of the pit contained hydrocarbon impacted material and cooling tower debris; therefore, the analyses included TPH DRO and GRO, BTEX, and four samples for 8-RCRA metals. The north end of the pit only contained hydrocarbon impacted material; therefore, the analyses included TPH DRO and GRO, and BTEX.

2.5 Site Restoration

After the waste materials were removed from the pit and were disposed at the Lea Land Landfill, the surface area around the former pit was re-graded and re-vegetated with native plant species to prevent erosion.

Artesia Pit Closure Report

3.0 Closure Sampling Results

A total of 12 initial closure soil samples were collected from the south end of the pit on July 10, 2002 and were labeled ARP-CLS-04 through ARP-CLS-14. On July 11, 2002 12 closure soil samples were collected from the north end of the pit and were labeled ARP-CLS-24 through ARP-CLS-33. The purpose of the samples was to verify that all regulated material was removed from the pit, and as discussed in Section 1.3, to document that the following soil remediation levels were achieved:

- 10 ppm benzene;
- 50 ppm total BTEX; and
- 100 ppm total petroleum hydrocarbons.

Review of the laboratory analytical data as summarized on Table 2, indicates that none of the closure soil samples had concentrations of benzene or total BTEX that exceeded the respective remediation level. Only one of the closure samples exceeded the remediation level for TPH. This sample was ARP-CLS-11, which had a total TPH concentration of 101 milligrams per kilogram (mg/kg). Additional soil was excavated from this location and the area was re-sampled and labeled ARP-CLS-11B. The total TPH analytical result for this sample was 26.4, which is below the remediation level.

Soil samples were also collected from clean fill that was imported to the site to be used as backfill and from a large quantity of native soil that had been stockpiled near the pit from recent onsite construction activities. Samples were collected to verify that the fill would be suitable to be used in the excavation after closure had been achieved. A total of nine soil samples were collected from the stockpile and the imported fill and were labeled ARP-BFP-15 through ARP-BFP-20 and ARP-BFL-21 through ARP-BFL-23, respectively. Only one of the soil samples collected from the stockpile had a total TPH concentration exceeding the 100 ppm remediation level. This was sample ARP-BFP-16 with a concentration of 309 mg/kg. The soil from this location exhibited no staining or odors and may have been impacted by minor lubrication leaks from onsite construction equipment. The soil from the ARP-BFP-16 location was loaded and transported for disposal at the Lea Land Landfill.

Four closure soil samples were submitted for 8-RCRA total metals analysis due to the presence of cooling tower debris in the south end of the pit. The results of the analysis are summarized on Table 3 and are indicative of background metals concentrations.

Artesia Pit Closure Report

4.0 Conclusions and Recommendation

Based on the results of the pit closure activities summarized in the previous sections including field observations, field screening with a PID, and laboratory analysis of soil samples collected from the two pits, Cordilleran has developed the following conclusions and recommendations for the waste pit closure at the Artesia Plant.

1. The plant is located 14 miles east of the town of Artesia, New Mexico. The climate of the area is characterized as semi-arid with approximately 15 inches of precipitation per year. There is a well with a windmill for watering livestock located 250 feet west of the pit.
2. The land surface at the plant is generally flat with a gentle rise of approximately 40 feet per mile to the east. An intermittent stream drainage lies 4,500 feet east of the plant. No water was encountered during the pit closure activities. The reported depth to groundwater at the site is approximately 50 feet bgs.
3. Soils encountered at the site consisted of silty, fine-grained sands with caliche nodules. No free liquids were encountered in the pit.
4. Based on the depth to groundwater, location of the nearest wellhead protection area, and distance to the nearest surface the OCD remediation guidelines for the soil are 10 ppm benzene, 50 ppm total BTEX, and 100 ppm TPH.
5. The waste material identified in the south and north ends of the pit were characterized as a non-hazardous solid waste for disposal at the Lea Land, Inc. Southwest Landfill located in Carlsbad, New Mexico. No hazardous waste was encountered during the closure activities.
6. Approximately 2,000 cubic yards of waste material and soil was removed from the pit and disposed at the Lea Land Landfill.
7. The laboratory results for the closure soil sampling indicate that all of the regulated waste material was removed from the site and the OCD soil remediation guidelines were achieved.

Based on the findings of the pit closure activities summarized above, Cordilleran recommends that no further action is necessary at this pit.

RE: Waste Characterization Letter and Profile for the Artesia Plant

Saralyn:

Attached is a cover letter and profile for the waste pit at the DEFS Artesia Plant. Please review and approve. We are scheduled to begin site excavation activities on the 9th of July.

Thank you,
John D. Lohner
Principal Geologist/Vice President

**RE: Waste Approval Application
Duke Energy Field Services, LP
Artesia Gas Processing Plant, Artesia, New Mexico
Cordilleran Project Number ED02052**

Dear Ms. Hall:

Duke Energy Field Services, LP (DEFS) has contracted Cordilleran Compliance Services, Inc. (Cordilleran) to close a solid waste disposal pit located at the Artesia Gas Processing Plant (site) located along County Road 206 east of the town of Artesia, Eddy County New Mexico. The legal description is the southeast quarter of Section 7, Township 18 South, Range 28 East. Cordilleran requests that Lea Land review the information enclosed in this document and approve the disposal of the waste material at the Carlsbad facility. The following discussion presents the results of a waste characterization investigation that was conducted at the site on June 6, 2002.

The objectives of the preliminary investigation were to identify the contents of the waste in the pit and collect representative waste characterization samples for laboratory analysis. Three composite soil samples were collected from material that was removed from three backhoe trenches excavated into the pit. These soil samples were submitted to the Environmental Lab of Texas in Midland Texas following chain-of-custody protocol for analysis of the following parameters by the stated methods:

- Total petroleum hydrocarbon (TPH) gasoline range organics (GRO-C₆ to C₁₂) by EPA method 8015M;
- TPH diesel range organics (DRO-C₁₂ to C₃₅) by EPA method 8015M;
- Benzene, toluene, ethylbenzene, xylenes by EPA method 8021B;
- 8 total RCRA metals by EPA SW-846; and
- TCLP metals for two elements exhibiting high total concentrations by EPA SW-846.

Based on the results of the preliminary site investigation, the pit measures approximately 140 feet long by 40 feet wide. The pit is open and partially full of debris and a second adjacent pit of similar dimensions is buried north of the open pit. The estimated volume of material in the pit is approximately 4,140 cubic yards based on the pit dimensions of 140' by 40' by 6' in depth (in the open pit area) and 140' by 40' by 14' (in the covered area of the pit). The pit area has been used since the 1950's for the disposal of a variety of waste materials generated at the Artesia Gas Plant. Inspection of material excavated from the backhoe trenches and the material in the open section of the pit indicated that the following waste was present: inert construction debris (concrete and wood); scrap metal (pipe, valves, rebar); exploration and production (E&P) exempt wastes; cooling tower debris; used filter socks; molecular sieve beads; paper and plastic; hydrocarbon-impacted soil and empty 5-gallon plastic buckets.

Three composite waste characterization samples were collected from the backhoe trenches. Two of the samples, ARP-WCS-01 and ARP-WCS-02, were collected from the closed section of pit and sample ARP-WCS-03 was collected from the open section of the pit. Review of the laboratory data, as summarized in Tables 1 and 2, indicates that the samples collected are characteristic of non-hazardous solid waste. A copy of the laboratory analytical results is attached to this letter.

Table 1 Artesia Pit Waste Characterization Organics Analysis							
Sample ID	GRO mg/kg	DRO mg/kg	TPH mg/kg	Benzene mg/kg	Ethyl- Benzene mg/kg	Toluene mg/kg	Xylenes mg/kg
ARP-WCS-01	< 10.0	25.8	25.8	< 0.025	< 0.025	0.061	0.068
ARP-WCS-02	< 10.0	19.3	19.3	< 0.025	< 0.025	0.037	< 0.050
ARP-WCS-03	< 10.0	13.4	13.4	0.029	0.083	0.178	0.278

Notes to table 1:

GRO = total petroleum hydrocarbons (TPH), gasoline range organics;
DRO = TPH, diesel range organics;
mg/kg = milligrams per kilogram;
TPH analysis by EPA modified 8015;
BTEX analysis by EPA method 8021B
Analysis performed by The Environmental Lab of Texas

Table 2 Artesia Pit Waste Characterization Inorganic Metals Analysis									
Sample ID	As mg/kg	Ba mg/kg	Cd mg/kg	Cr mg/kg	Pb mg/kg	Se mg/kg	Ag mg/kg	Hg mg/kg	TCLP mg/l
ARP-WCS-01	4.2	233	3.43	30.6	< 0.550	< 0.20	< 0.10	0.23	
ARP-WCS-02	3.08	204	0.884	15.2	< 0.550	< 0.20	1.62	0.1	
ARP-WCS-03	16.8	945	1.08	790	3.67	3.17	< 0.10	< 1.00	0.027*

Notes to table 2:

mg/kg = milligrams per kilogram;

mg/l = milligrams per liter

As – arsenic, Ba – barium, Cd – cadmium, Cr – chromium, Pb – lead, Se – selenium, Ag – silver, and Hg – mercury;

TCLP = toxicity characteristics leaching procedure for *Cr analysis;

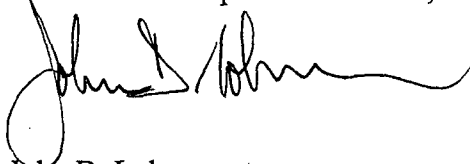

Total metals analysis by EPA SW-846;

Analysis performed by The Environmental Lab of Texas

Cordilleran requests that Lea Land, Inc. review the data presented in this letter and the attached Profile Application. As previously discussed, we have a tentative start date for the closure of the pit beginning the week of July 8, 2002; therefore, your expeditious handling of this matter is appreciated. We look forward to working with you on this project.

Sincerely,

Cordilleran Compliance Services, Inc.

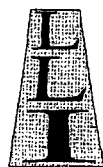

John D. Lohner
Principal Geologist
