SOIL ANALYSIS REPORT

DATE: 1/31/01  
INSPECTOR: J.L. Ham

CLIENT Devon Energy  
FACILITY: Foster Battery

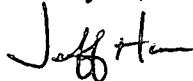

COMMENTS

This report represents the results of the soil analysis conducted at Devon Energy Foster Battery.

The information contained in this report identifies the Total Petroleum Hydrocarbon (TPH) results from the site. Soil surrounding the location was impacted after the production tank overflowed. The impacted soil inside the berm surrounding the tank was excavated 2' deep. The impacted soil outside the berm was excavated 1' deep. Soil samples were gathered from the bottom of the excavated area inside the berm, from the location and outside the fence. A sample was gathered from the reclaimed soil. These samples were taken to Cardinal Laboratories in Hobbs, New Mexico for TPH Analysis using Method: SW -846 8015 M which was requested by Donna Williams from the Oil Conservation Division (OCD) in Hobbs New Mexico.

Results from the Lab showed hydrocarbon levels were below the recommended level of 100 PPM from the bottom and 5000-PPM from the reclaimed soil as per Donna Williams. The reclaimed soil was then used to backfill the excavated areas and rebuild berm around the production tanks. Cardinal Laboratories results can be found on the following page.

Thank you,
