RE: MONITOR WELL #3 INVESTIGATIONS
SHEEP DRAW WELLFIELD
CARLSBAD, NEW MEXICO

Dear Mr. Tully:

Attached is a copy of the New Mexico Oil Conservation Division's (OCD) preliminary investigation report of the brine water that the City of Carlsbad discovered in monitor well MW#3 which was installed in the Sheep Draw Wellfield.

The OCD would like to meet with you after the city has an opportunity to review the report and discuss the results of the report and potential future actions at the site. Please contact me at your convenience so that we can set a meeting date.

If you have any questions, please contact me at (505) 476-3491.

Sincerely,

William C. Olson
Hydrologist

INTRODUCTION

On December 12, 2001, the New Mexico Oil Conservation Division (OCD) contacted the City of Carlsbad, New Mexico regarding information that the OCD had received on ground water contamination discovered during recent drilling a monitoring well within the city municipal water well field southeast of the City of Carlsbad for the purpose of monitoring the quantity and quality of ground water within the well field. Carlsbad informed the OCD that the city had encountered brine water during the drilling of ground water monitoring well MW-3 adjacent to the city water well field. They reported that a 2-foot void was encountered during drilling of the monitor well at a depth of 116 feet from the surface and that water flowed into the borehole. The city took a sample of the water and continued drilling. Preliminary testing by the city showed that hydrogen sulfide gas at a concentration of 600 ppm was present in the headspace of water samples and that the water salinity was off the scale of the field equipment.

Subsequently, the city received the results of the water analyses from Cardinal Laboratories which showed that the water had a specific conductivity of 95,000 micromhos/cm and contained 123,000 mg/l of chloride and non-detectable levels of TPH (GRO & DRO using modified EPA method 8015). These analytical results were verbally transmitted to the OCD and need to be verified with the actual laboratory analyses since it is not possible for a sample to have a specific conductivity higher than an individual chemical constituent.

At that time, the drilling ceased at a depth of 320 feet to prevent creation of a vertical conduit for migration of the brine water to deeper depths. The borehole was cemented back to 140 feet from the surface and a bentonite plug was then placed from 140 feet to 124 feet. The borehole is completed with approximately 80 feet of 6 inch surface casing. The remainder of the hole from 80 to 124 feet is uncased open hole. On December 20, 2001, the measured depth to ground water was 72.49 feet below the top of the casing.

Further water quality sampling by the city showed that the water also contained 0.005 mg/l of benzene and 0.005 mg/l of toluene. Based upon the water quality analyses, the city theorized that the ground water may be contaminated as a result of oil and gas operations and noted that a 1940's era oil and gas plug and abandonment (P&A) marker was located hydrologically upgradient approximately one-quarter to one-third of a mile west of monitor well MW-3.

SCOPE OF WORK

This report presents the results of a preliminary investigation into the origin of brine water discovered in MW-3, the possibility that the source of this water was oilfield activities in the area and the potential that these waters could impact the City of Carlsbad water well field .

Because the initial city water quality samples were taken from an undeveloped borehole during drilling, on January 28, 2002, the OCD issued a scope of work to AMEC Earth and Environmental (AMEC) to develop MW-3 and conduct additional water quality sampling of monitor well MW-3. AMEC submitted a work plan to the OCD on February 1, 2002 outlining the scope of the services to be performed and an estimate of the project costs. The OCD approved the work plan on February 6, 2002. The work plan was implemented between February 7, 2002 and March 5, 2002 and a report on the water quality sampling was received by the OCD on April 29, 2002.

At the same time, the OCD began to compile information on the geology of the site based upon the drilling logs of oil and gas production wells, the monitor well MW-3 drilling log and published reports on the area.

The OCD also reviewed well file records on the completion of oil and gas production wells and plugging of abandoned wells within the City of Carlsbad Wellhead Protection Area.

SITE DESCRIPTION

Monitor well MW-3 is located approximately 6 miles southwest of Carlsbad, New Mexico in the SE/4 SE/4 of Section 12, Township 23 South, Range 25 East, Eddy County, New Mexico (figure 1). The site lies within the oil and gas production area of the Sheep Draw Wellfield which occurs on a mix of federal, state and private lands. Nine municipal water wells for the public water supply for the City of Carlsbad are located west of the site within three-quarters of a mile of MW-3. Several oil and gas production wells are located within one mile of the site. The P&A marker noted by the city is the site of the Turner and Devito #1 well which was drilled and plugged and abandoned in 1940 without reaching an oil or gas production horizon. The Turner and Devito #1 well is located in the SW/4 SE/4 of Section 12, Township 23 South, Range 25 East, Eddy County, New Mexico.

GENERAL GEOLOGY

The site, within the Sheep Draw Wellfield, lies in the geologic area where the Guadalupian Series Permian Basin reef complex and Delaware Basin prograde into each other. The city water wells are found on the eastern fringe of the Guadalupe Ridge, which is made up of the massive Permian reef complex containing the Carlsbad and Capitan limestones. The Guadalupe Ridge defines the western margin of the Delaware Basin, which is a sedimentary and evaporite basin ringed by this limestone reef complex. The Guadalupe Stratigraphy Insert (figure 2) shows the general geological relationship of the reef complex to the Delaware Basin.

The Carlsbad limestone is a medium to thin bedded gray to buff limestone and dolomite but has some interbedded buff to pink siltstone. Its maximum thickness is about 1000 feet. The formation thins to the northwest as it grades into redbeds and evaporites of the Chalk Bluff formation. It also thins to the southeast as it interfingers with and overlaps the Capitan limestone and is the source of water for the City of Carlsbad's municipal wells.

The Capitan Limestone crops out along the front of the reef escarpment and in the canyon walls in Guadalupe Ridge in the southern part of Eddy County. It interfingers to the southeast with the Bell Canyon formation of the Delaware Mountain group and to the northwest with the Carlsbad limestone. The Capitan is a massive gray to buff limestone 1,000 to 2,000 feet thick containing solution cavities ranging in size from slight enlargements of joints and bedding planes to the huge caverns of Carlsbad Caverns National Park.

The upper portion of the Delaware basin consists of the Delaware Mountain group overlain by the Castile, Salado and Rustler formations. The Delaware Mountain group contains the basinal sandstones of the Bell Canyon, Cherry Canyon and Brushy Canyon formations interspersed with some thin limestone beds. The total thickness of the Delaware Mountain group ranges from approximately 2,670 feet to 3,040 feet.

Overlying the sedimentary rocks of the Delaware Mountain group in the Delaware Basin is the Castile formation, consisting of 1,300 to 2000 feet of anhydrite and gypsum with small amounts of halite, dolomite and sandstone. Although the Castile is composed predominately of anhydrite, it contains thick beds of halite under the Carlsbad alluvial basin which pinch out toward the west. The Castile

formation thins to the northwest along the base of the reef escarpment and thickens to the southeast toward the lower part of the basin. The Castile formation acts as a barrier to movement of ground water in the Capitan limestone. Water in the Castile formation is high in sulfate and is undesirable for human consumption.

The Salado formation consisting of halite and small amounts of anhydrite, polyhalite and other potassium salts, and red sandy shale, overlies the Castile formation in the area east of the Pecos River. West of the river most of it has been removed by solution. The Salado formation is not water bearing.

The Rustler formation unconformably overlies the Salado formation. It consists of anhydrite, gypsum, interbedded red and green sandy clay and some beds of dolomite. The Rustler formation ranges in thickness from about 200 feet in northern Eddy County to about 500 feet southeast of Carlsbad. In its outcrop areas the Rustler yields water to stock wells and some domestic wells. The water from the Rustler generally is not desirable for domestic use because of its high chloride and sulfate content. In certain areas wells penetrating the lower part of the Rustler yield a concentrated brine derived from the underlying Salado formation.

The surface geology consists of Quaternary alluvium which occurs along the drainages of Dark Canyon and Sheep Draw and drainages originating from Azotea Mesa and the Guadalupe Ridge. The alluvium consists of clay, silt, sand, gravel, caliche and conglomerate. Locally the conglomerate is so well cemented that it is reported as limestone by well drillers (G.E Hendrickson and R.S. Jones)(L.J. Bjorklund and W.S. Motts).

SITE INVESTIGATION RESULTS

Hydrogeology

Appendix A contains a circular published by the New Mexico Bureau of Mines and Mineral Resources which describes the geology from oil and gas wells drilled in the area. The abstract includes an east-west stratigraphic cross section relating how each borehole and its location ties in with the geology of the Permian Reef complex and the Delaware Basin in the vicinity of monitor well MW-3. One of the wells used in the cross section is the plugged and abandoned Turner and Devito #1 well. The Turner & Devito #1 well is shown to be located east of the limits of the Carlsbad and Capitan formations and out in the Delaware Basin It penetrates a thin layer of alluvium, then approximately 1000 feet of anhydrite in the Castile

formation, and terminates in the Bell Canyon formation of the Delaware Mountain group. Monitor well MW-3 is approximately 1,600 feet east of the Turner and Devito #1 well, placing MW-3 farther into the sedimentary units of the Delaware Basin and away from the reef complex.

Figure #3 is an east-west stratigraphic section, developed by the OCD, that transverses that area and includes the well logs from area oil and gas wells and the Turner & Devito #1 well. Beginning with the westward portion of the section, the Exxon Mary Federal #5 in Section 11 of Township 23 South, Range 25 East shows Permian carbonate reef lithology to a depth of 1620 feet where the operator set the first string of well casing to ensure protection of fresh water in the reef. The fourth well on this cross-section shows the Turner & Devito #1 well, approximately 1,600 feet west of MW-3. The strip log for the Turner & Devito #1 again shows anhydrite lithology from approximately 50 feet from the surface to a depth of 1,065 feet. The eastern-most well on the cross-section, the Cities Services Federal N Com #1 in section 5 of Township 23 South, Range 26 East, also shows lithology of the Delaware Mountain group and overlying salt sections of the Castile formation consistent with the cross-sectional stratigraphic representations presented in Appendix A by the New Mexico Bureau of Mines and Mineral Resources.

There is additional evidence of the lack of Capitan reef stratigraphy at the site in documents published by the United States Geological Survey (USGS). Figures 4 and 5 show that the basinal edge of the Capitan reef complex is west of the site and that the site is within the western margin of alluvial deposits where shallow ground water can be found.

The observations of the driller during the drilling of MW-3 appear to contradict the geologic stratigraphy discussed above. The drillers notes provided by the City of Carlsbad (figure 6) indicate that the surface is underlain by approximately 36 feet of alluvial sands, silts and clays containing some caliche and cobbles. From 36 feet to a total depth of 320 feet the drillers notes indicate that a continuous consolidated limestone section was encountered. The limestone was listed as fractured and weathered at the 36–47 foot interval and in the 92-118 foot interval where brine water was encountered. However, the well record (Appendix B) filed with the New Mexico Office of the State Engineer (OSE) lists the monitor well as being completed in "shallow alluvium/basin fill". In subsequent discussions with the driller of the well, it was not evident why this discrepancy occurred. The driller stated that there were no cores taken and no geologist on site logging the lithology of the monitor well during drilling. The lithologies provided in figure 6

were descriptions made by the driller based upon cuttings blown out of the borehole during air drilling of the well. He stated that the cuttings from the sections that he described as limestone were a fine white to gray powder and that drilling of the final 200 feet of this section to total depth occurred in a relatively short period of time. Based upon the relative ease of drilling and the lack of geologic logging of the well, it is possible that the interval being drilled below the surface alluvium is actually the anhydrite section of the Castile.

Ground water is found in the Carlsbad limestone at approximately the 400 foot depth in city water wells west of the site. Ground water flow within the Capitan reef complex is to the northeast along the arc of the reef (figure 4). Ground water depths in the shallow alluvium varies from approximately 20 – 200 feet. The direction of regional round water flow in the shallow alluvial aquifer is toward the east (figure 5) and away from the city well field. A City of Carlsbad produced ground water potentiometric map from water wells in the sections surrounding MW-3 also shows that the localized shallow ground water flow is to the east (figure 1).

Ground Water Quality

Regionally, the quality of ground water in the alluvial aquifers within T22S, R26E and T22S, R25E varies from 712–1680 mg/l of total dissolved solids (TDS) and 2-172 mg/l of chloride. Several alluvial ground water wells are located within two miles of monitor well MW-3, but no water samples taken from them during this investigation.

A description of the procedures and results of OCD's water quality sampling of MW-3 are found in Appendix C. Ground water in MW-3 was found to be at 77.10 feet from the top of the casing in the monitor well and the total measured depth of the well was 125.80 feet from the top of casing.

Table #1 lists the benzene, toluene, ethylbenzene and xylene (BTEX), chloride, sulfate and total dissolved solids (TDS) results of samples taken from monitor well MW-3. The samples listed from Trace Analysis, Inc. and Pinnacle Laboratories, Inc. are split samples from the same sampling event submitted to separate laboratories.

The results for chlorides, sulfates and TDS show good correlation between the different sampling events and laboratories. These samples show the water from

MW-3 is a saturated brine containing high levels of chloride (117,000 – 123,000 mg/l), sulfate (25,000 – 29,300 mg/l) and TDS (224,000 – 271,000 mg/l).

The BTEX results however are conflicting. Benzene and toluene were detected in the Carlsbad samples near the laboratory detection limit. Benzene was detected in OCD's Trace Analysis samples at the laboratory detection limit, but toluene, ethylbenzene and xylene were not observed. While no benzene was detected in OCD's Pinnacle Laboratories sample at a detection limit below those of the other samples, low levels of toluene, ethylbenzene and xylene were observed.

Produced Water Quality

Information on the quality of produced water in the Delaware Formation was reviewed to determine if the source of the chloride and TDS in ground water in MW-3 could be a result of leakage from the Turner and Devito #1 well.

Figure 7 shows the locations and chloride concentrations of water samples taken from Delaware formation wells. The chloride concentrations in Delaware formation waters east of the site in T22S, R27E; T23S, R26E; T23S, R27E; T24S, R26E; and T24S, R27E range from 59,000 mg/l to 190,000 mg/l. The Delaware well closest to MW-3, approximately 4 miles east, has formation water with a chloride concentration of 110,000 mg/l.

Table 2 contains a USGS tabulation of water quality parameters from Delaware Formation water in the central portion of the Delaware Basin in T25S, R32E; T26S, R32E; and T26S, R33E. The chloride concentrations in Delaware formation water in this area range from 130,000 to 190,000 mg/l; total dissolved solids (TDS) concentrations range from 220,000 to 290,000 mg/l; and sulfate concentrations range from 210 to 1800 mg/l.

Well File Review

The OCD reviewed the well files of all oil and gas wells located within the City of Carlsbad Critical Area Wellhead Protection Area (figure #8) and within one mile of MW-3 which included the area within Section 18, Township 23 South, Range 26 East. This involved reviewing:

- the setting depth of all casing strings (surface, intermediate and production) on all wells;

- well cementing records on volumes and quality of cement used and cementing intervals;

- history of water flows or other problems encountered during drilling, production and plugging operations; and

- plugging procedures, volumes of cement used in cement plugs, intervals of all isolation plugs, and tagging of cement plugs to verify plugged intervals.

Oil and gas drilling began in the area as early as 1940 with wells being drilled by cable tool. A listing of the oil and gas wells drilled within the surveyed area can be found in Table #3. Records relating to the OCD's review can be found in Appendix D.

The review found most of the cementing operations were witnessed by OCD and/or BLM personnel, cement was circulated to the surface or staged to the surface on the surface and intermediate casing strings of all wells in the area of review, casing and top of cement requirements for production strings were within regulatory requirements, and plugged wells in the area of review were plugged according to current rules and guidelines for plugging and abandonment with the exception of the Turner and Devito #1 and Ramuz #1 wells.

The Turner and Devito #1 well is a 1940 cable tool drilled well located approximately 1,600 west of monitor well MW-3. Sulfur water flows were reported at 755 and 880 feet from the surface during the drilling of the Turner and Devito #1 well. Water flows were also reported in the Turner & Devito #1 at a depth of 1,456 feet. At the termination of drilling at 1,758 feet, 1,200 feet of sulfur water was reported in the hole. The hole was constructed with 451 feet of 10-inch surface casing cemented with 5 sacks of cement and 1,533 feet of 7-inch casing that was not cemented. The amount of water in the hole prevented further drilling and the hole was abandoned without reaching a hydrocarbon zone. There is no record as to how this well was plugged.

The Ramuz #1 well is a 1940 cable tool drilled well located approximately 2,000 feet southeast of monitor well MW-3. A salt water flow was reported during the drilling of the Ramuz #1 at a depth of 1,808 feet. Water came up approximately 1,500 feet in the hole and the well was abandoned without reaching a hydrocarbon

zone. The bottom of the hole was plugged with cement from approximately 1,808 feet to 1,730 feet. From approximately 1,660 to 1,425 feet, 235 feet of cemented 7-inch casing was left in the hole. The hole was filled with mud from 1730 feet to 225 feet. A cement plug was placed on top of the mud from approximately 225 to 150 feet. The remainder of the hole was filled with mud from 150 feet to the surface through the 100 feet of 8 ¼ inch surface pipe and a cement cap of unknown thickness was placed at the surface. This well plugging does not meet OCD's current plugging guidelines.

CONCLUSIONS

The geology of the site shows that it is located outside the Capitan reef complex that contains the public water supply wells for the City of Carlsbad and that monitor well MW-3 is most likely completed in the Castile Formation. Since the Castile formation acts as a barrier to movement of ground water in the Capitan reef complex and shallow ground water flow is to the east, away from the Carlsbad city water supply system, the brine water in the shallow ground water at MW-3 should not pose a threat to the city water system.

The quality of ground water in MW-3 is high in sulfate, as would be expected of water in the Castile formation. The water also contains high levels of chloride and TDS, and low levels of BTEX. The concentrations of chloride and TDS in ground water from MW-3 are similar in concentration to waters produced from the Delaware formation.

The Turner and Devito #1 and Ramuz #1, 1940's oil and gas exploratory wells, were identified as not meeting the OCD's current regulatory casing, cementing and plugging requirements and/or guidelines. It is possible that the brine waters could be a result of leakage from these exploratory wells. Both wells were drilled into the Delaware Formation but were plugged without reaching an oil or gas production horizon.

The Turner and Devito #1 is located hydrologically upgradient of MW-3 and encountered a pressurized water zone in the Delaware formation that caused cable tool drilling to cease and the well to be plugged. While there is no record of whether this well was plugged to prevent migration of the waters encountered during drilling, water only rose 1,200 feet in the 1758 foot hole. Therefore, the static water level in the Turner and Devito #1 well would be 558 feet below the ground surface which is well below the level at which ground water was

discovered in MW-3 (116 feet below ground surface). Unless the water zones in the Turner and Devito #1 increased in pressure since it was plugged, these deep waters should not reach the elevation at which ground water was discovered in MW-3.

The Ramuz #1 also encountered pressurized water in the Delaware formation that caused cable tool drilling to cease and the well to be plugged. However, this well is located approximately 2,000 feet downgradient of monitor well MW-3 and would be less likely to be the cause of the brine water observed in MW-3. At this site the well was plugged for protection of shallow ground waters, but not according to current requirements. Water pressure also caused water to rise in the hole during drilling, in this case, 1,500 feet in a 1,808-foot hole. The static water level in the Ramuz #1 well would be 308 feet below the ground surface which is also well below the level at which ground water was discovered in MW-3. Again, as in the case of the Turner and Devito #1, unless the water zones in the Ramuz #1 increased in pressure over time since plugging, these deep waters should not reach the elevation at which ground water was found in MW-3.

As a result, with the available information, the source of the brine water in monitor well MW-3 cannot be conclusively determined at this time.

RECOMMENDATIONS

Since the Turner and Devito #1 and Ramuz #1 wells are located within the wellhead protection areas of the City of Carlsbad, they should be re-entered and plugged according to current guidelines for protection of ground water. During reentry, if possible, a water sample should be obtained from each well and analyzed for BTEX, major cations and anions, and heavy metals in order to determine if deep waters from these wells are similar in composition to the shallow waters found in monitor well MW-3.

If pressurized or flowing waters are discovered during the replugging of these wells and the composition of the waters is similar in composition to the ground water in MW-3, additional monitor wells may be needed to determine if there has been migration of fluids from the Turner and Devito #1 and Ramuz #1 wells.

In cooperation with
NEW MEXICO STATE ENGINEER

RESOURCE MAP 4

This map was prepared to assist potential users of industrial and agricultural water in the general area of the Capitan reef located in southeastern New Mexico. It depicts the varying quality that may be available from aquifers in the Guadalupian Series of Permian age. Water containing relatively high concentrations of chloride ions (10,000 to more than 150,000 milligrams per litre) is found in rocks of the Guadalupian Series on the Northwest Shelf northwest of Hobbs, New Mexico, on the Central Basin platform, and in the Delaware basin. Conversely, water containing relatively low chloride-ion concentrations (less than 10,000 milligrams per litre) is associated with the Capitan aquifer, the San Andres Limestone, and the Artesia Group along the margins of the Delaware basin and at the north and south ends of the Central Basin platform. Fingers of the best quality of water extend into the Capitan aquifer to the north and east from the Guadalupe Mountains, New Mexico, and to the north away from the Glass Mountains, Texas.

The quality of ground water found in rocks of the Guadalupian Series in the western part of the Permian basin is controlled primarily by hydraulic conductivity of the aquifer and the proximity to the outcrop which is present in the western and southern part of the basin. Leaching of soluble minerals from the Guadalupian Series at the surface has enhanced the hydraulic conductivity where these rocks are exposed west of the Pecos River on the Northwestern shelf and in the Guadalupe Mountains. Fresh water enters the Guadalupian Series at outcrops in the Guadalupe, Delaware, Apache, and Glass Mountains, and at other exposures along the western and southern edges of the Permian basin. The fresh water has replaced saline water in the aquifer in amounts proportional to the hydraulic conductivity of the aquifers that have been developed by leaching of the strata. Relatively fresh water may be found resting upon saline water, as in the general case west of the Pecos River between Artesia and Carlsbad, or it may be encountered in situations where it is overlain and (or) surrounded by more saline water as, for example, in the vicinity of Carlsbad and in the San Andres Limestone and Grayburg Formation south of Hobbs, New Mexico. Throughout the area, water with a relatively low salinity can be found inter-fingering with water that is relatively high in salinity. This relationship has been shown to be a dependable qualitative indicator of the relative differences in hydraulic conductivity of the rocks.

The data were obtained from many sources including various exploration, production, and service companies within the petroleum industry and State and Federal agencies. The analyses represent samples of water collected over a period of approximately 45 years from 1926 to 1971 but are believed to accurately depict, on a regional basis, the water now present in the Permian (Guadalupian) age sedimentary rocks.

The two examples below illustrate use of the map. Water containing less than 5,000 milligrams per litre chloride is available near Carlsbad, in an arcuate strip parallel to the Capitan aquifer, and in narrow bands at either end of the Central Basin platform. By closer examination of the data points, the individual aquifers that would contain water of this quality can be identified from the plotted data points. On the other hand, an exploration for concentrated brines would be restricted to areas where the Guadalupian rocks are known to contain nearly saturated brines, as in the Delaware Mountain Group in eastern Loving County, Texas.

EXPLANATION

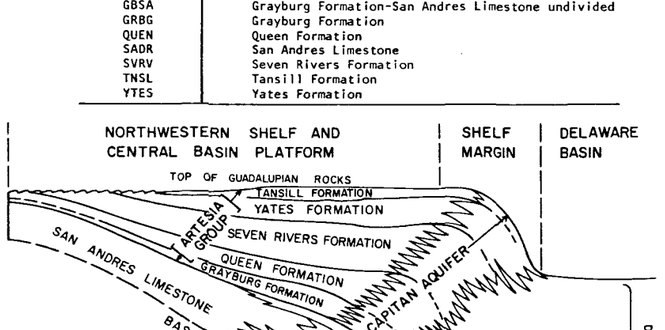
Position of Capitan aquifer — Approximate position of extreme shelfward edge; Approximate position of basinal edge

50 — Line of equal chloride-ion concentration, in thousands of milligrams per litre. Dashed where inferred. Based on lowest concentration shown or interpreted to be present. Within any area delineated by two lines, ground water having a chloride-ion concentration indicated by the line values is probably present in at least one water-bearing zone; ground water having a higher chloride-ion concentration than that indicated by the contour values is generally present also.

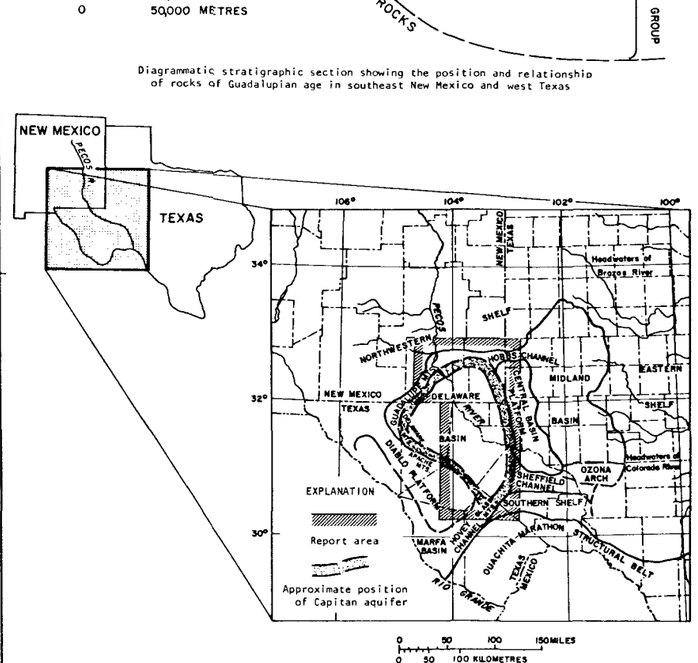
Stratigraphic code representing name of the formation from which water sample has been collected. The stratigraphic codes are listed in order of stratigraphic position, youngest first — Well penetrating rocks of Permian (Guadalupian) age

Multiple sample taken from same formation — CPAQ 7600 + 12,000 & DLWR 170,000 — Chloride-ion concentration in mg/l

Code	Stratigraphic Codes: Name (all units are of Permian age)
CPAQ	Capitan aquifer
DLWR	Delaware Mountain Group
GBSA	Grayburg Formation-San Andres Limestone undivided
GRBG	Grayburg Formation
QUEN	Queen Formation
SADR	San Andres Limestone
SVRV	Seven Rivers Formation
TNSL	Tansill Formation
YTES	Yates Formation



Diagrammatic stratigraphic section showing the position and relationship of rocks of Guadalupian age in southeast New Mexico and west Texas



Location of report area and tectonic elements in the Permian basin of west Texas and southeast New Mexico (modified after fig. 7, Oriel, Meyers, and Crosby, 1967, West Texas Permian basin region, in McKee, E. D., and Oriel, S. S., eds., Paleotectonic investigations of the Permian System in the United States: U.S. Geological Survey Professional Paper 515, p. 17-60).

New Mexico base from U.S. Geological Survey, Branch of Oil and Gas Operations, Roswell 9 South 1 inch = 2 miles (1963). Texas base from Midland Map Co. BM-2 (1969), BM-3 (1966), BM-4 (1961), BM-11 (1956), BM-12 (1956), BM-13 (1961), BM-17 (1955), and BM-18 (1955) 1 inch = 5,000 feet, used with permission of Midland Map Co.

CHLORIDE-ION CONCENTRATION IN GROUND WATER IN PERMIAN GUADALUPIAN ROCKS, SOUTHEAST NEW MEXICO AND WEST TEXAS

Abstract

The Tansill Formation (shelf deposit), upper Capitan Formation (shelf margin deposit), and Lamar Limestone (basinal deposit) are the uppermost carbonate units of the Permian Reef Complex. The Lamar Limestone Member of the Bell Canyon Formation is separated from the overlying Castile Formation by the "post-Lamar beds" consisting of Capitan debris at the margin of the Delaware Basin and a thin sandstone unit further basinward. The generally accepted correlation of the middle and lower Tansill with the Lamar (Tyrrell, 1969) has been questioned by Achauer (1969) and Kelly (1971), who correlate the Lamar with the Seven Rivers Formation. Their correlations contradict the exceptionally fine fusulinid zonation first established by Skinner and Wilde (1954, 1955) for the Lamar.

Fig. 1 shows the location and stratigraphic relationship of two Amoco Research core holes and a section measured along the north wall of Dark Canyon. The Amoco No. 2 Dark Canyon cored 399 ft of the Tansill Formation and the upper 70 ft of the underlying Yates Formation. The Ocotillo Silt Member is present from 86-118 ft. Fusulinid occurrences in this core include (from top to bottom):

Fusulinid	Depth (in ft)
Poorly preserved *Paraboultonia*(?)	15-80
Reichelina	106-232
Paradoxiella	242-324
Codonofusiella	332-469 (total depth)
Yabeina texana	391 (one bed)

In the Amoco No. 1 Dark Canyon core hole, the upper 220 ft consists mostly of Tansill lithology with a few units of Capitan lithology; the section from 220-290 ft is transitional with alternating Tansill and Capitan lithologies; and the section from 290 ft to total depth (400 ft) is massive Capitan. *Paraboultonia* is common from 40-394 ft, and no *Reichelina* were found.

The small Tethyan fusulinid genera in the two core holes and in measured sections and well cuttings of Tansill and Lamar between Dark Canyon and McKittrick Canyon reconfirm: 1) *Paraboultonia* is restricted to the Ocotillo Silt Member and the overlying upper Tansill beds, as well as to the uppermost Capitan, uppermost Lamar and post-Lamar beds; 2) *Reichelina* slightly overlaps the lower part of the *Paraboultonia* zone, but otherwise is restricted to the middle Tansill and to all except the lower Lamar; 3) *Paradoxiella* is present in the middle Tansill and middle and lower Lamar; 4) *Yabeina texana* is restricted to the lowermost Tansill and lowermost Lamar; 5) *Codonofusiella* ranges as high as the lower Tansill and lower Lamar; 6) *Polydiexodina,* the large fusulinid characteristic of the upper Guadalupian in west Texas, does not range as high as the Tansill or Lamar.

RE: MONITORING WELL SAMPLING
CITY OF CARLSBAD WELL FIELD
CARLSBAD, NEW MEXICO

This letter report presents the results of AMEC Earth and Environmental's (AMEC) ground water sampling from MW-3 in the City of Carlsbad Well Field southwest of Carlsbad, New Mexico. AMEC submitted a work plan to the New Mexico Oil Conservation Division (OCD) dated February 1, 2002 outlining the scope of services to be performed for the investigation. The project was authorized by the OCD in correspondence to AMEC dated February 6, 2002. The project followed the terms and conditions of AMEC's Site Maintenance and Monitoring Contract (PA No. 00-805-09-17658) awarded to AMEC by the State of New Mexico, General Services Department.

The study consisted of developing and purging water from the existing monitor well MW-3, obtaining and submitting ground water samples for laboratory analysis, and disposing of purged water at an OCD approved facility. This report includes a summary of the field activities, presents the laboratory reports, and provides documentation for the purged water disposal.

Field Program

On February 7 and 8, 2002, AMEC personnel traveled to the site and attempted to develop monitor well MW-3 with a Grunfos submersible pump. Depth to ground water was measured at 77.10 feet below the top of casing (toc); the total depth of the well was measured at 125.80 feet below toc. IW, Inc. Vacuum Truck Service was on standby at the site to transport purged water to a disposal facility. After numerous attempts to purge the well, it was determined the pump would not function due to the high density (i.e. high total dissolved solids content) of the ground water.

AMEC personnel returned to the site on March 4, 2002 to develop the well. Geomechanics Southwest provided a drilling rig with a wire line and a clean, PVC bailer to develop the well. The well was developed and purged until the water temperature, pH, and conductivity stabilized. Purged water was containerized for later disposal. Twenty-four hours after development, on March 5, 2002, AMEC personnel returned to the site and purged the well with the rig mounted bailer until water temperature, pH, and conductivity stabilized. Purged water was containerized for later disposal. Ground water samples were obtained from the well with the PVC bailer at that time.

The ground water samples obtained were placed in containers supplied by the laboratory and placed in a cooler with ice. The samples were shipped to Trace Analysis of Lubbock, Texas for chemical analysis by EPA methods listed in the attachments. Each ground water sample was collected, containerized, and preserved according to standard laboratory protocol. Field notes are presented in the attachments.

New Mexico Oil Conservation Division
Monitoring Well Development and Sampling
City of Carlsbad Well Field, Carlsbad, New Mexico
AMEC Project No. 2-517-000008
April 26, 2002

The water samples were analyzed for benzene, toluene, ethylbenzene, and total xylenes (BTEX) by EPA Method 8021 and for gasoline range total petroleum hydrocarbons (GRO-TPH) and diesel range total petroleum hydrocarbons (DRO-TPH) by EPA Method 8015B. In addition, the samples were tested for pH, alkalinity, specific conductance, chloride, total dissolved solids, fluoride, nitrate, sulfate, calcium, magnesium, potassium, sodium, and a list of 16 metals by approved EPA methods. Copies of the chain-of-custodies and chemical analyses reports for ground water samples are provided in with the laboratory reports in the attachments.

No BTEX or TPH were detected in the water samples. Of note, total dissolved solids were 271,000 mg/L and chlorides were 117,000 mg/L.

The containerized purge water was transported to Controlled Recovery of Hobbs, New Mexico. The waste manifests are included in the attachments.

We appreciate the opportunity to provide environmental services to the Oil Conservation Division for this project. If you have any questions regarding this report, please give me a call at (505) 821-1801.

Respectfully submitted,

AMEC Earth & Environmental, Inc.

Bob Wilcox, P.G.
Senior Project Manager

Attention: BILL OLSON

On 03/06/02 Pinnacle Laboratories, Inc., (ADHS License No. AZ0592 pending), received a request to analyze **aqueous** samples. The samples were analyzed with EPA methodology or equivalent methods. The results of these analyses and the quality control data, which follow each set of analyses, are enclosed.

EPA method 8021 analyses were performed by Pinnacle Laboratories, Inc. Albuquerque, NM.

All other analyses were performed by EnviroTest Laboratories, LLC. Casper, WY.

If you have any questions or comments, please do not hesitate to contact us at (505)344-3777.

SAMPLE DELIVERY GROUP NARRATIVE

The following information is relevant to the interpretation of the data for the above job:

METALS

The samples are digested with trace metals grade acid and, depending on the batch of acid, different metals will be present to some extent above the detection limit of the ICP/MS. In this case this is true for aluminum, barium, chromium, calcium, iron, potassium, magnesium, sodium and zinc. This should be taken into consideration when interpreting the data.

The RPD's for arsenic, boron, chromium, copper, potassium, sodium, selenium and vanadium were all above the acceptance criteria. This was due to a large amount of sediment present in the bottom of the sample. Frequently this causes the duplicate to be above the acceptance criteria due to non-homogeneous matrix. This is normal and to be expected. All attempts were made to homogenize the sample before taking the sample and duplicate aliquots. All other QC was acceptable and the data was reported.

The sample chosen for the matrix spike in the trace metals run had levels of magnesium that were very high (greater than 10 times the amount of spike added), causing the % recovery to be outside acceptance limits. This is to be expected and does not compromise the quality of the data. All other QC for magnesium was acceptable and the data was reported

The dilution factor for beryllium, boron and sodium does not print on the report due to space constraints. The dilution used for each element was 10,000.

If you have any questions regarding this analysis, please call the lab at (307) 235-5741 or (800) 666-0306.

Reference Information

Report Date: 27-MAR-02
Work Order: L4741

The following is the Description of sample Qualifiers where applicable:

The following Preparation/Extraction Methods were performed:

ETL Test Code and Matrix		Test Description	Methodology Reference (Based On)
AG-TOT-LOW-CA	Water	Silver (Ag)-Total	SW846 3010A
AL-TOT-LOW-CA	Water	Aluminum (Al)-Total	SW846 3010A
AS-TOT-LOW-CA	Water	Arsenic (As)-Total	SW846 3010A
B-TOT-LOW-CA	Water	Boron (B)-Total	SW846 3010A
BA-TOT-LOW-CA	Water	Barium (Ba)-Total	SW846 3010A
BE-TOT-LOW-CA	Water	Beryllium (Be)-Total	SW846 3010A
CA-TOT-LOW-CA	Water	Calcium (Ca)-Total	SW846 3010A
CD-TOT-LOW-CA	Water	Cadmium (Cd)-Total	SW846 3010A
CO-TOT-LOW-CA	Water	Cobalt (Co)-Total	SW846 3010A
CR-TOT-LOW-CA	Water	Chromium (Cr)-Total	SW846 3010A
CU-TOT-LOW-CA	Water	Copper (Cu)-Total	SW846 3010A
FE-TOT-LOW-CA	Water	Iron (Fe)-Total	SW846 3010A
K-TOT-LOW-CA	Water	Potassium (K)-Total	SW846 3010A
MG-TOT-LOW-CA	Water	Magnesium (Mg)-Total	SW846 3010A
MN-TOT-LOW-CA	Water	Manganese (Mn)-Total	SW846 3010A
MO-TOT-LOW-CA	Water	Molybdenum (Mo)-Total	SW846 3010A
NA-TOT-LOW-CA	Water	Sodium (Na)-Total	SW846 3010A
NI-TOT-LOW-CA	Water	Nickel (Ni)-Total	SW846 3010A
PB-TOT-LOW-CA	Water	Lead (Pb),-Total	SW846 3010A
SB-TOT-LOW-CA	Water	Antimony (Sb)-Total	SW846 3010A
SE-TOT-LOW-CA	Water	Selenium (Se)-Total	SW846 3010A
SI-TOT-CA	Water	Silicon (Si)-Total	SW846 3010A
TL-TOT-LOW-CA	Water	Thallium (Tl)-Total	SW846 3010A
V-TOT-LOW-CA	Water	Vanadium (V)-Total	SW846 3010A
ZN-TOT-LOW-CA	Water	Zinc (Zn)-Total	SW846 3010A
AG-TOT-LOW-CA	Water	Silver (Ag)-Total	
AL-TOT-LOW-CA	Water	Aluminum (Al)-Total	
ALK-CO3-CA	Water	Carbonate (as CaCO3)	
ALK-HCO3-CA	Water	Bicarbonate (as CaCO3)	
ALK-TOT-CA	Water	Alkalinity, Total	
AS-TOT-LOW-CA	Water	Arsenic (As)-Total	
B-TOT-LOW-CA	Water	Boron (B)-Total	
BA-TOT-LOW-CA	Water	Barium (Ba)-Total	
BAL-PCNT-CALC-CA	Water	Anion-Cation Balance	
BE-TOT-LOW-CA	Water	Beryllium (Be)-Total	
BR-CA	Water	Bromide by IC	
CA-TOT-LOW-CA	Water	Calcium (Ca)-Total	
CD-TOT-LOW-CA	Water	Cadmium (Cd)-Total	
CL-IC-CA	Water	Chloride by IC	
CO-TOT-LOW-CA	Water	Cobalt (Co)-Total	
CR-TOT-LOW-CA	Water	Chromium (Cr)-Total	
CU-TOT-LOW-CA	Water	Copper (Cu)-Total	
EC-CA	Water	Conductivity (EC)	
F-IC-CA	Water	Fluoride by IC	
FE-TOT-LOW-CA	Water	Iron (Fe)-Total	
K-TOT-LOW-CA	Water	Potassium (K)-Total	

MN-TOT-LOW-CA	Water	Manganese (Mn)-Total
MO-TOT-LOW-CA	Water	Molybdenum (Mo)-Total
NA-TOT-LOW-CA	Water	Sodium (Na)-Total
NI-TOT-LOW-CA	Water	Nickel (Ni)-Total
PB-TOT-LOW-CA	Water	Lead (Pb),-Total
PH-CA	Water	pH
SB-TOT-LOW-CA	Water	Antimony (Sb)-Total
SE-TOT-LOW-CA	Water	Selenium (Se)-Total
SI-TOT-CA	Water	Silicon (Si)-Total
SO4-IC-CA	Water	Sulfate by IC
SOLIDS-TDS-CA	Water	Total Dissolved Solids
TL-TOT-LOW-CA	Water	Thallium (Tl)-Total
V-TOT-LOW-CA	Water	Vanadium (V)-Total
ZN-TOT-LOW-CA	Water	Zinc (Zn)-Total

The following Analytical Methods were performed:

ETL Test Code and Matrix		Test Description	Methodology Reference (Based On)
AG-TOT-LOW-CA	Water	Silver (Ag)-Total	SM 3125-ICP-MS
AL-TOT-LOW-CA	Water	Aluminum (Al)-Total	SM 3125-ICP-MS
ALK-CO3-CA	Water	Carbonate (as CaCO3)	SM 2320 B-Pot. Titration
ALK-HCO3-CA	Water	Bicarbonate (as CaCO3)	SM 2320 B-Pot. Titration
ALK-TOT-CA	Water	Alkalinity, Total	SM 2320 B-Pot. Titration
AS-TOT-LOW-CA	Water	Arsenic (As)-Total	SM 3125-ICP-MS
B-TOT-LOW-CA	Water	Boron (B)-Total	SM 3125-ICP-MS
BA-TOT-LOW-CA	Water	Barium (Ba)-Total	SM 3125-ICP-MS
BAL-PCNT-CALC-CA	Water	Anion-Cation Balance	SM 1030 F-Calculation
BE-TOT-LOW-CA	Water	Beryllium (Be)-Total	SM 3125-ICP-MS
BR-CA	Water	Bromide by IC	SW846 9056
CA-TOT-LOW-CA	Water	Calcium (Ca)-Total	SM 3125-ICP-MS
CD-TOT-LOW-CA	Water	Cadmium (Cd)-Total	SM 3125-ICP-MS
CL-IC-CA	Water	Chloride by IC	EPA 300.1
CO-TOT-LOW-CA	Water	Cobalt (Co)-Total	SM 3125-ICP-MS
CR-TOT-LOW-CA	Water	Chromium (Cr)-Total	SM 3125-ICP-MS
CU-TOT-LOW-CA	Water	Copper (Cu)-Total	SM 3125-ICP-MS
EC-CA	Water	Conductivity (EC)	SM 2510 B-electrode
F-IC-CA	Water	Fluoride by IC	EPA 300.1
FE-TOT-LOW-CA	Water	Iron (Fe)-Total	SM 3125-ICP-MS
K-TOT-LOW-CA	Water	Potassium (K)-Total	SM 3125-ICP-MS
MG-TOT-LOW-CA	Water	Magnesium (Mg)-Total	SM 3125-ICP-MS
MN-TOT-LOW-CA	Water	Manganese (Mn)-Total	SM 3125-ICP-MS
MO-TOT-LOW-CA	Water	Molybdenum (Mo)-Total	SM 3125-ICP-MS
NA-TOT-LOW-CA	Water	Sodium (Na)-Total	SM 3125-ICP-MS
NI-TOT-LOW-CA	Water	Nickel (Ni)-Total	SM 3125-ICP-MS
PB-TOT-LOW-CA	Water	Lead (Pb)-Total	SM 3125-ICP-MS
PH-CA	Water	pH	SM 4500 H-Electrode
SB-TOT-LOW-CA	Water	Antimony (Sb)-Total	SM 3125-ICP-MS

SI-TOT-CA	Water	Silicon (Si)-Total	SM 3120 B-ICP-OES
SO4-IC-CA	Water	Sulfate by IC	EPA 300.1
SOLIDS-TDS-CA	Water	Total Dissolved Solids	SM 2540 C
TL-TOT-LOW-CA	Water	Thallium (Tl)-Total	SM 3125-ICP-MS
V-TOT-LOW-CA	Water	Vanadium (V)-Total	SM 3125-ICP-MS
ZN-TOT-LOW-CA	Water	Zinc (Zn)-Total	SM 3125-ICP-MS

Sample Receipt ~~Checklist~~

Client	Pinnacle	Job Number	L4741

Samples Shipped	(UPS)	Federal Express	Airborn:
Samples Hand Delivered	Client	ETL Lab Courier	Other:

*Air Bill # 1Z878168014319 7115	# of Packages Received: 1

	Yes	No	N\A	Comments
1. Chain - of - Custody present?	X			If no, please fill one out.
2. Are the COC and sample labels legible?	X			
3. Custody Seal on shipping container?		X		
If yes, intact on shipping container?				
4. Custody seals on sample containers?		X		
If yes, intact on sample container?				
5. Samples chilled?	X			
Is temperature of cooler: 4 ± 2°C ?	X			*Record temp: 4 °C
6. Samples received intact (good condition)?	X			
If volatiles required, any with headspace?				
7. Adequate sample volume provided?	X			
8. Samples preserved correctly?	X			$Na_2S_2O_3$, ZnAc, (HNO_3), HCl
Circle preservative types in shipment				H_2SO_4, NaOH, (Plain), Other
9. Correct containers used?	X			
10. Samples received within holding time?	X			
11. Agreement between COC and sample labels?	X			
12. Gamma Screen µR/Hr @ surface within Bkg?	X			FOR INTERNAL USE ONLY @ BKg
13. Samples OK to release to Lab/Screening?	X

Spud 26" hole on 9-14-85. Ran 20", 94# conductor pipe to 85'. Cemented w/250 sx C1C and circulated w/no returns. Left 15' cement in conductor. Had good cement 34' from surface. Received approval from BLM to order pea gravel and ready mix. WOC 9 hours before drill out. Lost returns at 203'. Dumped pea gravel down backside of conductor. Obtained approval to use Gear Gum to build visc. pills. Found parted csg. Pulled csg. & left 20' in hole - tagged at 65'. Pumped 100 bbls. 250 visc. pill before running wireline survey. Resumed drilling & lost returns at 544'. Pumped 50 bbls. 150 visc. - no returns. Drilled w/no returns. Set 13-3/8", 54.5# K55 STC at 1510'. Preflushed w/100 sx. C1C. Cemented w/1600 sx Lite C & 300 sx C1C. This was approved by Jim Wright, State Engineer. Notified BLM of temp. survey on 9-21-85. Ran survey & found cement at 950'. Ran 1" tbg. Tagged at 710'. Pumped 150 sx C1C. Pulled tbg. & WOC. Ran 1" tbg. Tagged at 627'. Pumped 3 yards pea gravel & 100 sx C1C. Pulled tbg. & WOC. Ran 1" tbg. Tagged at 610'. Added 3 yards pea gravel and 100 sx C1C. Pulled tbg. & WOC. Ran 1" tbg. Tagged at 610'. Pumped 4 yards pea gravel and 100 sx C1C. Pulled tbg. & WOC. Ran 1" tbg. Tagged at 480'. Pumped 5 yards pea gravel and 100 sx C1C. Pulled 1" tbg. Left 275' in hole. WOC. Ran 1" tbg. Tagged at 480'. Pumped 2-1/2 yards gravel & 100 sx C1C. Pull tbg. & WOC. Ran 1" tbg. Tagged at 60'. Pumped 75 sx C1C - no returns. Pumped 2-1/2 yards pea gravel & 10 sx cmt. Tagged cmt at 1430'. Art Mason from State Engineer's office came by and approved 1" procedure. Resumed drilling.

eral: This form is designed for submitting proposals to perform certain well operations, and reports of such operations when completed, as indicated, on Federal and Indian lands pursuant to applicable Federal law and regulations. Consult applicable State law and regulations. State laws and regulations should be followed in preparing this report and any supplemental records. Consult local, area, or regional procedures and practices, either are shown below or will be issued by, or may be obtained from, the local Federal and/or State office.

Item 4: If there are no applicable State requirements, locations on Federal or Indian land should be described in accordance with Federal requirements. Consult State or Federal office for specific instructions.

Item 17: Proposals to abandon a well and subsequent reports of abandonment should include such special information as is required by local Federal and/or State office. In addition, such proposals and reports should include reasons for the abandonment; depths (top and bottom) and method of placement or present productive zones, or other zones with present significant fluid contents not sealed off by cement or otherwise; data on any former or present information as is required by local Federal and/or State office. above plugs; amount, size, method of parting or any casing, liner or tubing pulled and the depth to top of any left in the hole; method of closing top of well; and date well site conditioned for final inspection looking to approval of the abandonment.

WELL HAS BEEN SI SINCE JANUARY, 1992 BUT IS STILL CAPABLE OF PRODUCING IN PAYING QUANTITIES AND CAN BE RETURNED TO BENEFICIAL USE. IT IS REQUESTED THAT WELL REMAIN SI. JIM AMOS, CARLSBAD BLM, ADVISED THIS DATE THAT WE WOULD NOT HAVE TO COMPLY WITH BLM LETTER DATED 7-24-92 REQUIRING WELL TO BE TA. (COPY OF LETTER IS ATTACHED) THIS SN IS SUBMITTED TO CONFIRM MY DISCUSSION ON THE ABOVE WITH JIM AMOS AND TO AVOID THE ISSUANCE OF AN INCIDENT OF NONCOMPLIANCE.

REQUEST FOR ALLOWABLE AND AUTHORIZATION TO TRANSPORT OIL AND NATURAL GAS

I.

Operator: EXXON CORPORATION

Address: BOX 1600 MIDLAND TEXAS 79702

Reason(s) for filing (Check proper box)

- New Well [ ]
- Recompletion [X]
- Change in Ownership [ ]
- Change in Transporter of: Oil [ ] Dry Gas [ ] Casinghead Gas [ ] Condensate [ ]

Other (Please explain): PLUG BACK - RECOMPLETE IN STRAWN 10,138-10160'

If change of ownership give name and address of previous owner: _____

II. DESCRIPTION OF WELL AND LEASE

Sheep Draw Strawn

Lease Name	Well No.	Pool Name, Including Formation	Kind of Lease	Lease No.
SOLAR FEDERAL	1	~~UNDESIGNATED SOUTH CARLSBAD STRAWN~~	State, Federal or Fee NM 045 3201	

Location

Unit Letter F : 1980 Feet From The NORTH Line and 1980 Feet From The WEST

Line of Section 12 Township 23-S Range 25-E , NMPM, EDDY C

III. DESIGNATION OF TRANSPORTER OF OIL AND NATURAL GAS

Name of Authorized Transporter of Oil [ ] or Condensate [X]	Address (Give address to which approved copy of this form is to be sent)
NAVAJO CRUDE OIL PURCHASING CO.	P.O. BOX 159, ARTESIA NM 88210
Name of Authorized Transporter of Casinghead Gas [ ] or Dry Gas [ ]	Address (Give address to which approved copy of this form is to be sent)
TRANSWESTERN PIPE LINE CO.	P.O. BOX 2521 HOUSTON, TEXAS 77001

If well produces oil or liquids, give location of tanks.	Unit	Sec.	Twp.	Rge.	Is gas actually connected?	When
	F	12	23-S	25-E	YES	8-24-84

If this production is commingled with that from any other lease or pool, give commingling order number: _____

McVay Drilling Co. spudded a 17 1/2" hole at 3:30 PM 2-19-78. Reached TD of 17 1/2" hole at 375' at 6 AM 2-21-78. Ran 10 jts 13 3/8" 48# H-40 ST & C (357') Set at 375'. Cemented with 200 sacks Class H lite weight and 200 sacks Class H with 2% CaC12. Cement did not circulate. Ran 4 1/2 yards of ready mix to surface. WOC 18 hrs. Tested 13 3/8" casing 500# for 30 min - OK.

Started drilling a 12 1/4" hole at 375' at 3 AM 2-22-78.

A 12.25" hole was drilled to 2050' K.B. on 6/3/92. Full returns were lost while drilling at 920' K.B. The hole was dry drilled to 2050'. A caliper log was run prior to running casing to determine the best possible setting depth for the external casing packer (a copy of Cardinal Wireline field print is enclosed). 9.625" 43.50, 47, and 53.50#/ft., N-80 and S-95 Buttress casing was run and set at 2050' K.B. Top of external casing packer at 828.41' from surface. Top of D.V. tool at 778.08' from surface. Cemented first stage: 475 sacks Hallaiburton Lite with 1/2#/sk., flocele, 2% CACL2, and 10# Cal-Seal. (2.01 cu.ft./sk. yield, 12.7#/gallon), tailed in with 200 sacks Premium Plus with 2% CALC2, (1.32 cu.ft./sk., 14.8#/gallon weight). Dropped bomb and waited 6 hours, cement did not circulate. Cemented Second Stage: with 275 sacks Halliburton Lite with 1/4# flocele/sk., 4% CACL2, and 6# Gilsonite, (1.84 cu.ft./sk. yield, 12.7#/gallon). Tailed in with 100 sacks Premium Plus with 4% CACL2 and 6# gilsonite (1.32 cu.ft./sk., 14.8#/gallon). Cement did not circulate Waited on cement for 3.5 hours and ran remperature survey, no cement top. Rig up to one-inch. Ran one inch 10 times with 35 sacks cement each run. Top of cement 686' after tenth run. Cemented with 255 sacks cement, circulated cement to surface. Set slips and nippled up, test to 2400 psig with rig pump. Cemented with a total of 570 sacks cement. Tested BOP, stack, safety valve to 5000 psig, tested hydrill 2000 psig.

NOTE: A cement Bond Log will be conducted on the 9.625" casing prior to running the next casing string.

REQUEST FOR ALLOWABLE AND AUTHORIZATION TO TRANSPORT OIL AND NATURAL GAS

Form C-104
Supersedes Old C-104 and Effective 1-1-65

RECEIVED
MAR - 1 1978
O. C. C.
ARTESIA, OFFICE

I. Operator

Hanagan Petroleum Corporation ✓

Address

P.O. Box 1737, Roswell, New Mexico 88201

Reason(s) for filing *(Check proper box)*

New Well ☐
Recompletion ☒
Change in Ownership ☐

Change in Transporter of:
Oil ☐ Dry Gas ☐
Casinghead Gas ☐ Condensate ☐

Other *(Please explain)*

If change of ownership give name and address of previous owner

II. DESCRIPTION OF WELL AND LEASE

Lease Name	Well No.	Pool Name, Including Formation	Kind of Lease	Lease No.
Newman	1	BrynesTank-Middle Delaware Gas	State, Federal or Fee State	K 4761-

Location

Unit Letter O ; 2300 Feet From The East Line and 660' Feet From The South

Line of Section 7 Township 23 South Range 26 East, NMPM, Eddy County

III. DESIGNATION OF TRANSPORTER OF OIL AND NATURAL GAS

Name of Authorized Transporter of Oil ☐ or Condensate ☒	Address *(Give address to which approved copy of this form is to be sent)*
Navajo Crude Oil Purchasing Company	P.O. Box 175, Artesia, New Mexico 88210
Name of Authorized Transporter of Casinghead Gas ☐ or Dry Gas ☒	Address *(Give address to which approved copy of this form is to be sent)*
Transwestern Pipeline Company	P.O. Box 2521, Houston, Texas 77001

If well produces oil or liquids, give location of tanks.	Unit	Sec.	Twp.	Rge.	Is gas actually connected?	When
	O	7	23S	26E	Yes	3-31-78

If this production is commingled with that from any other lease or pool, give commingling order number:

Gentlemen:

Following is a notice of intention to do certain work as described below at the

E Paul Moran (Company or Operator) #1 Ramuz (Lease) Well No. 1 in NE¼NW¼

of Sec. 18, T. 23 S, R. 26 E, N. M. P. M., Wildcat Field,

Eddy County.

FULL DETAILS OF PROPOSED PLAN OF WORK

FOLLOW INSTRUCTIONS IN THE RULES AND REGULATIONS OF THE COMMISSION

Struck water(salt) at 1808' and came up aproximately 1500' in the hole. We are cementing this water with 10 sacks of cement. Will leave in the hole between 200 and 250' of cemented pipe which we ran to shut off water encountered at 1565'. After balance of pipe is pulled willfill hole with mud up to 250ft from the surface and cement with 10 sacks of cement to protect whatever surface waters there may be above, then will mud hole up to near the surface and palce a cement cap with regulation 4" pipe as marker for this well

NOTICE OF INTENTION TO DRILL

RECEIVED
MAY 31 1940
HOBBS OFFICE

Notice must be given to the Oil Conservation Commission or its proper agent and approval obtained before drilling begins. If changes in the proposed plan are considered advisable, a copy of this notice showing such changes will be returned to the sender. Submit this notice in triplicate. One copy will be returned following approval. See additional instructions in Rules and Regulations of the Commission.

CARLSBAD, N. M. (Place) Jan. 10, 1940 (Date)

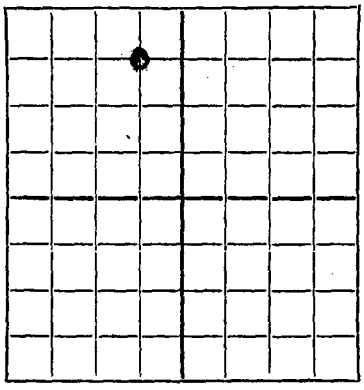
OIL CONSERVATION COMMISSION,
Santa Fe, New Mexico

Gentlemen:

You are hereby notified that it is our intention to commence the drilling of a well to be known as

RAMUZ (Company or Operator) Well No. 1 in (Lease)

of Sec. 18, T. 23 S, R. 26E, N. M. P. M., Dark Canyon Field, Eddy County.



AREA 640 ACRES
LOCATE WELL CORRECTLY

The well is 660 ft feet [N.] [S.] of the North line and 1980 ft feet [E.] [W.] of the West line of Sec 18 Twp. 23 S Rnge. 26 E.

(Give location from section or other legal subdivision lines. Cross out wrong directions.)

If state land the oil and gas lease is No. _____ Assignment No. _____

If patented land the owner is Ramuz, Carlsbad, N. M.

Address _____

If government land the permittee is _____

Address _____

The lessee is D. C. DeVito

Address Scharbauer Hotel, Midland, Texas

We propose to drill well with drilling equipment as follows:

Model Super D Forth Worth spudder

The status of a bond for this well in conformance with Rule 39 of the General Rules and Regulations of the Commission is as follows: Appld for American Emp. Ins. Co.

We propose to use the following strings of casing and to land or cement them as indicated:

Size of Hole	Size of Casing	Weight Per Foot	New or Second Hand	Depth	Landed or Cemented	Sacks Cement
10 "	8¼ "	30#	S. H.	Approx 150'	Cmt.	25 Sx.
8 "	7 "	20#	New	1350'	Cmt. 100 sx. if it is neccessary to use this pipe	

If changes in the above plan become advisable we will notify you before cementing or landing casing. We estimate that the first productive oil or gas sand should occur at a depth of about 1500 feet.

Additional information:

Although the salt section should not be found on this location it will be protected according to the rules and regulations if it should be encountered.

MAY 31 1940

Gentlemen:

Following is a report on the work done and the results obtained under the heading noted above at the

E. Paul Moran (Company or Operator) Ramuz (Lease) Well No. 1 in the NE¼ NW¼ of Sec. 18, T. 23 south, R. 26 east, N. M. P. M., Wildcat Field, Eddy County

The dates of this work were as follows: July 23-25

Notice of intention to do the work was ~~(was not)~~ submitted on Form C-102 on July 7 1940 19..... and approval of the proposed plan was ~~(was not)~~ obtained. (Cross out incorrect words.)

DETAILED ACCOUNT OF WORK DONE AND RESULTS OBTAINED

After drilling plug, 2 bailers of water came in per hour, prepared well for Halliburton to test for shut off. Halliburton placed 600 lbs. pressure at the casing head and declared it to be a perfect shutoff. Water coming in is what water was absorbed by the open formation . Now bailing and water exhausting.

Gentlemen:

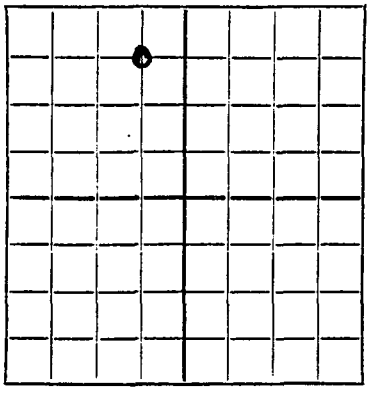
You are hereby notified that it is our intention to commence the drilling of a well to be known as

RAMUZ (Company or Operator) Well No. 1 in

of Sec. 18, T. 23 S, R. 26E, N. M. P. M., Dark Canyon (Lease) Field, Eddy County.

N.



AREA 640 ACRES
LOCATE WELL CORRECTLY

The well is 660 ft feet [N.] [S.] of the North line and 1980 ft feet [E.] [W.] of the West line of Sec 18 Twp. 23 S Rnge. 26 E.

(Give location from section or other legal subdivision lines. Cross out wrong directions.)

If state land the oil and gas lease is No. _____ Assignment No. _____

If patented land the owner is Ramuz, Carlsbad, N. M.

Address _____

If government land the permittee is _____

Address _____

The lessee is D. C. DeVito

Address Scharbauer Hotel, Midland, Texas

We propose to drill well with drilling equipment as follows:

Model Super D Forth North Spudder

The status of a bond for this well in conformance with Rule 39 of the General Rules and Regulations of the Commission is as follows: Appld for American Emp. Ins. Co.

We propose to use the following strings of casing and to land or cement them as indicated:

Size of Hole	Size of Casing	Weight Per Foot	New or Second Hand	Depth	Landed or Cemented	Sacks Cement
10 "	8¼ "	30#	S. H.	Approx 150'	Cmt.	25 Sx.
8 "	7 "	20#	New	1350'	Cmt.	100 sx. if it is neccessary to use this pipe.

If changes in the above plan become advisable we will notify you before cementing or landing casing. We estimate that the first productive oil or gas sand should occur at a depth of about 1500 feet.

Additional information:

Although the salt section should not be found on this location it will be protected according to the rules and regulations if it should be encountered.

MAY 31 1940

Approved _____, 19____

NE¼ NW¼ of Sec. 18, T. 23 south, R. 26 east, N. M. P. M.,

Wildcat Field, Eddy County

The dates of this work were as follows: July 23-25

Notice of intention to do the work was ~~(was not)~~ submitted on Form C-102 on July 7 1940 19.....
and approval of the proposed plan was ~~(was not)~~ obtained. (Cross out incorrect words.)

DETAILED ACCOUNT OF WORK DONE AND RESULTS OBTAINED

After drilling plug, 2 bailers of water came in per hour, prepared well for Halliburton to test for shut off. Halliburton placed 600 lbs.pressure at the casing head and declared it to be a perfect shutoff. Water coming in is what water was absorbed by the open formation . Now bailing and water exhausting.

of Sec. 18, T. 23 S, R. 26 E, N. M. P. M., Wildcat Field,

Eddy County.

FULL DETAILS OF PROPOSED PLAN OF WORK

FOLLOW INSTRUCTIONS IN THE RULES AND REGULATIONS OF THE COMMISSION

Struck water(salt) at 1808' and came up aproximately 1500' in the hole. We are cementing this water with 10 sacks of cement. Will leave in the hole between 200 and 250' of cemented pipe which we ran to shut off water encountered at 1563'. After balance of pipe is pulled willfill hole with mud up to 250' from the surface and cement with 10 sacks of cement to protect whatever surface waters there may be above, then will mud hole up to near the surface and palce a cement cap with regulation 4" pipe as marker for this well
