Re: Lovington Paddock Unit No. 59 Well Site

Case No. 1RP-915

2018 Site Assessment Report and Work Plan

Lea County, New Mexico

Dear whom it concerns,

Please find enclosed for your files, copies of the following report:

Lovington Paddock Unit No. 59 Well Site 1RP-915 2018 Site Assessment Report

The submittal was prepared by GHD Services, Inc. (GHD) on behalf of Chevron Environmental Management Company (CEMC).

Please do not hesitate to call Scott Foord with Arcadis U.S., Inc., the current consultant, at 713-953-4853 or myself at 832-854-5601, should you have any questions.

Sincerely,

Jason Michelson

#### 1. Introduction

GHD is pleased to present this Site Assessment Report to Chevron Environmental Management Company (CEMC) for the Lovington Paddock Unit (LPU) 59 site release location (hereafter referred to as the "Site"). The Site is located in Unit G, Section 1, Township 17 South, Range 36 East, approximately 5 miles southeast of the City of Lovington (COL) in Lea County, New Mexico. The land surface is owned by the COL and the minerals are managed by the State of New Mexico. The location of the Site is identified on the vicinity map of Figure 1 and the aerial map of Figure 2.

# 2. Regulatory Criteria

#### 2.1 Soil

Historical subsurface investigation activities were completed in accordance with the Guidelines for Remediation of Leaks, Spills, and Releases Rule 19.15.29 New Mexico Administrative Code (NMAC) from the New Mexico Oil Conservation Division (NMOCD) dated August 13, 1993. The former site-specific Recommended Remediation Action Levels (RRALs) previously applied to this location by the NMOCD were 10 milligrams per kilogram (mg/kg) for benzene, 50 mg/kg for total benzene, toluene, ethylbenzene, and xylenes (BTEX), 100 mg/kg for total petroleum hydrocarbons (TPH), and 600 mg/kg for chloride.

Rule 19.15.29 was revised and reissued on August 14, 2018. The following criteria from Table 1 (below) within NMAC 19.15.29.12 was utilized to determine site-specific screening limits.

Minimum depth below any point within the horizontal boundary of the release to ground water less than 10,000 mg/l TDS	Constituent	Limit*
>100 feet	Chloride**	20,000 mg/kg
	TPH (GRO+DRO+MRO)	2,500 mg/kg
	GRO+DRO	1,000 mg/kg
	BTEX	50 mg/kg
	Benzene	10 mg/kg

<sup>\*</sup> Numerical limits or natural background level, whichever is greater.

Localized depth to groundwater was confirmed to be approximately 107 feet below ground surface (bgs) in 2018 based on the information from monitoring wells MW-1 and MW-2 (located approximately 120-feet to the southeast of the original spill). See Figure 3 for monitoring well and soil boring locations. Additionally, information available from various sources including the New Mexico Office of the State Engineer (NMOSE) Point of Diversion (POD) Mapping Portal, Petroleum Recovery Research Center (PRRC) Mapping Portal, currently managed groundwater site(s) data by GHD, and the United States Geological Survey (USGS) Current Water Database for the Nation, concludes:

<sup>\*\*</sup> This applies to release of produced water or other fluids which may contain chloride.

- a) the depth to groundwater at the Site is greater than 100-feet bgs;
- b) the site is not within 300 feet of any continuously flowing watercourse;
- c) the site is not within 200 feet of any lakebed, sinkhole or playa lake;
- d) the site is not within 300 feet of an occupied permanent residence, school, etc.;
- e) the site is not within 500 feet of a spring or private, domestic fresh water well;
- f) the site is not within 1,000 feet of any fresh water well or spring;
- g) the site is not within incorporated municipal boundaries or within a defined municipal fresh water well field;
- h) the site is not within 300 feet of a wetland;
- i) the site is not within an area overlying a subsurface mine;
- j) the site is not within an unstable area; and
- k) the site is not within a 100-year floodplain.

Consequently, the anticipated site-specific screening limits to be applied to this location by the NMOCD based on the revised Rule are 10 mg/kg for benzene, 50 mg/kg for total BTEX, 2,500 mg/kg for total TPH, and 20,000 mg/kg for chloride.

#### 2.2 Groundwater

The guidance also requires remediation of groundwater to human health standards of the New Mexico Water Quality Control Commission (NMWQCC) established in New Mexico Administrative Code Section 20.6.2.3103. Standards for chloride and total dissolved solids (TDS) are listed below.

Analyte	NMWQCC Standard for Groundwater (mg/L)
Chloride	250
TDS	1,000

# Project Information and Background

According to historical records provided to GHD, an estimated 40 barrels (10 barrels recovered) of produced water were released from a pipe in a valve box at this location on June 4, 2006. The approximate affected area was estimated at 200 feet x 200 feet.

Shallow soil samples were collected from the impacted area in July 2010 from six hand augered sample locations (AH-1 through AH-6) at sampling intervals of 0 to 0.5 feet below ground surface (bgs), and in August 2010 from six locations in a sample trench (T-1 through T-6) at sample intervals of 0 to 1 feet bgs. Sample analyses included TPH; BTEX; and chloride from the July 2010 sampling event, and chloride only during the August 2010 sampling event. TPH and BTEX concentrations were below laboratory detection limits in the upper sample intervals from the hand augered locations (0 to 0.5 feet), and therefore these analyses were not performed for the deeper intervals collected

from the trench samples. Chloride results from both intervals collected at locations AH-2, AH-4, T-2, T-3, T-4, T-5, and T-6 exceeded the historical RRAL of 250 mg/kg for chloride.

In May 2011, GHD subcontractor Harrison Cooper, Inc. (HCI) advanced five soil borings (SB-1 through SB-5) utilizing an air-rotary drilling rig to depths ranging from 20 to 40 feet bgs, and soil samples were collected at five-foot intervals within each of the five soil borings. Samples were submitted to ALS Environmental laboratory in Houston, Texas for analysis of chlorides by EPA Method 300.

Laboratory analytical results indicated that the vertical extent of chloride impact was not yet defined in borings SB-2 and SB-3. On June 27, 2012, GHD and CEMC met at the NMOCD District 1 Hobbs office to discuss the path forward for the Site. The NMOCD requested that additional assessment be completed to further evaluate the vertical extent of chloride impacts.

In December 2012, under the supervision of GHD, HCl advanced two additional borings (SB-2b and SB-3b) utilizing an air-rotary drilling rig to depths of 70 feet bgs. Soil samples were collected from 40 to 70 feet bgs at 10-foot intervals in an effort to delineate the vertical extent of chloride impacts to soil. Samples were placed in laboratory-supplied sample containers on ice, labeled, and submitted to Lancaster Labs in Lancaster, Pennsylvania for analysis of chloride by EPA Method 300. Groundwater was not encountered in either boring. Following completion of activities, the borings were backfilled with hydrated bentonite pellets to the ground surface.

Monitoring well MW-1 was installed in October 2016 to assess potential groundwater impact in follow-up to soil analytical results collected and reported during previous assessments conducted in 2010 through 2012. The initial assessments indicated chloride concentrations extending vertically to a depth of at least 70 feet bgs. MW-1 was installed utilizing mud rotary drilling methods therefore no soil samples were collected during MW-1 installation activities. The depth to groundwater was confirmed at the Site at 101 feet bgs. BTEX and TPH constituents were non-detect in the groundwater sample, and chloride concentrations reported for the groundwater sample collected from MW-1 in October 2016 were below the NMWQCC standard of 250 milligrams per liter (mg/L).

Analytical results associated with assessment activities conducted from 2010 through 2016 indicated that the horizontal and vertical extent of chloride impact in soil had not been fully delineated.

Groundwater from MW-1 was re-sampled in May 2017, and six additional soil borings (SB-6 through SB-11) were advanced and analytical analyses performed in October 2017 in an attempt to fully delineate the horizontal and vertical extents of chloride impact to soil.

The Site is delineated based on the revised NMOCD regulatory requirements for chloride in soil. Groundwater sample results from MW-1 were below NMWQCC standards for chloride and TDS. However, NMOCD requested a down gradient well be installed to confirm no impact to groundwater down gradient of the release area. As such, MW-2 was installed approximately 130-feet in the general down gradient direction (southeast of the spill location). Details of the drilling and sampling activities for MW-2 are in the following sections.

# 2018 Drilling and Sampling

One monitoring well (MW-2) was advanced at the Site to further assess and impact to water southeast of the release area. Prior to mobilizing drilling equipment to the Site, the soil boring locations were pre marked and a New Mexico 811 One-Call utility locate was completed at least 48 hours prior to start of work. A secondary utility check was completed that included Ground Penetrating Radar (GPR) services by High Mesa of Albuquerque, New Mexico.

On September 6, 2018, GHD and GHD subcontractor HCI, mobilized to the Site to begin monitoring well installation activities for MW-2. The well was pre-cleared with a hydro-excavator to a depth of 5 feet bgs or until refusal. The well was then drilled to 90 feet bgs via air rotary and then to 130 feet bgs with mud rotary due to borehole collapse. The total drilling depth was approximately 25-feet below the water table. During drilling, a GHD geologist observed, visually inspected, and logged soil cuttings at 10-foot intervals and recorded subsurface lithology in accordance with the Unified Soil Classification System in field books. The boring log prepared from the field information can be found in Appendix A.

The soil types observed in soil samples collected during the drilling program consisted of fine grained sand with caliche followed by fine grained sand with pebbles and then poorly graded sand with caliche. Chloride screening was accomplished in the field by mixing soil samples with distilled water, then testing the rinsate using Hach chloride test strips.

Soils samples were collected for laboratory analysis from MW-2 at 4, 10, 20, 30, 40, 50, 60, 70, 80, and 90 feet bgs. Soil samples were packed into laboratory prepared jars and stored in a cooler with ice. The soil samples were sent to Xenco Laboratories (Xenco) in Midland, Texas for chloride analysis by EPA Method 300.

#### 4.1 Soil Sampling Analytical Results

A soil analytical summary of results from 2010 through 2018 is presented in Table 1. A Chloride Analytical Results Map for Soils (2010 – 2018) is presented as Figure 4.

 Chloride concentrations above the revised Rule 19.15.29 screening limit of 20,000 mg/kg were not reported in any of the soil samples collected from MW-2.

The 2018 soil laboratory analytical report is included in Appendix B.

### Groundwater Assessment

Groundwater sample results from existing monitoring well MW-1 have been collected at a minimum of annually since October 2016 with reported chloride concentrations below the NMWQCC standard of 250 mg/L. All groundwater samples have also been below the TDS standard of 1,000 mg/L. MW-2 was installed in September 2018 and MW-1 was re-sampled in October 2018 along with newly installed well MW-2.

#### 5.1 Monitoring Well Installation

MW-2 was completed with four-inch diameter, schedule 40 polyvinyl chloride (PVC) casing, 30 feet of 0.010-inch PVC slotted screen, a 20/40 sand filter pack overlain by a bentonite seal extending up to 10 feet bgs, and riser casing extending above the ground surface. The well was completed at the surface with a stick-up protective casing set in an approximate 2 feet by 2 feet concrete pad.

Preliminary gauging data indicated that groundwater was present at approximately 105 feet below the top of casing. The well was developed by removal of sufficient volumes of water to clear the well casing and annulus of sediment. Turbid water was removed with a 3-inch diameter bailer. Following bailing, well development was completed by pumping with a submersible pump. The boring log, well construction diagram, and the State Well Report are provided in Appendix A.

Soil cuttings, drilling fluids and well development water were contained in a lined mudbox. The drill cuttings/fluids and development water were transported as exploration and production (E&P) exempt waste to Sundance Services, Inc. near Eunice, New Mexico.

#### 5.2 Groundwater Sampling

Groundwater gauging was conducted and the vertical conductivity profiled throughout the entire water column of each of the monitoring wells (MW-1 and MW-2) prior to groundwater sampling activities. Depth to groundwater was measured in MW-1 and MW-2 to the nearest hundredth of a foot (106.42 and 107.30 feet bgs respectively) from the top of casing using an electronic water level meter on October 31, 2018. The conductivity profile of the water column was determined by recording conductivity at five-foot intervals from the top of the water column to the total depth of the well (230 feet bgs for MW-1 and 130 feet bgs for MW-2). The results of the conductivity profile are summarized on Table 3.

Low-flow purging techniques were used prior to sampling. During purging, the flow rate was adjusted to approximately 100 milliliters per minute in order to achieve minimal drawdown from the static water level. Temperature, oxidation reduction potential (ORP), pH, conductivity, and dissolved oxygen (DO) were monitored during purging. Purging continued until at least three of these parameters remained stabilized within a 10 percent range during three consecutive measurements. A groundwater sample was then collected in laboratory-supplied containers, labeled, and chilled on ice in an insulated cooler to maintain a temperature of 40°F (4°C) or lower. Field equipment was decontaminated with a Liquinox™ wash and distilled water rinse before beginning field activities and between wells.

Groundwater samples were submitted to Xenco Laboratories in Midland, Texas for analysis of chloride by EPA Method 300 and TDS by Method SM2540C. Chain of custody documentation was maintained throughout the sample collection and delivery process. Analyses were completed within required holding times.

#### 5.3 Groundwater Analytical Results

Chloride was detected at a concentration of 159 mg/L from MW-1 and 137 mg/L from MW-2, which are both below the 250 mg/L standard. TDS was reported at a concentration of 727 mg/L from the

sample collected from MW-1 and 753 mg/L from the sample collected from MW-2, which are below the 1,000 mg/L standard.

Groundwater analytical results for chloride and TDS are summarized in Table 2 in reference to NMWQCC standards. The laboratory analytical report is provided in Appendix B.

# 6. Summary of Findings

Evaluation of the analytical data obtained from soil assessment and delineation activities performed from 2010 through 2018 indicate horizontal and vertical delineation of chloride impacts to soil has been achieved at the Site.

#### 6.1 2019 Remediation Activities

Lateral and horizontal delineation of soil has been completed at the Site. Groundwater samples collected from MW-1 and MW-2 have confirmed no impact to groundwater at the Site. As such, soil remediation activities (excavation) per NMAC 19.15.29.13 will be conducted at the Site following NMOCD approval of the 2019 Remediation Work Plan attached as Appendix C of this report. GHD would also like to request permission to plug and abandon monitoring wells MW-1 and MW-2.

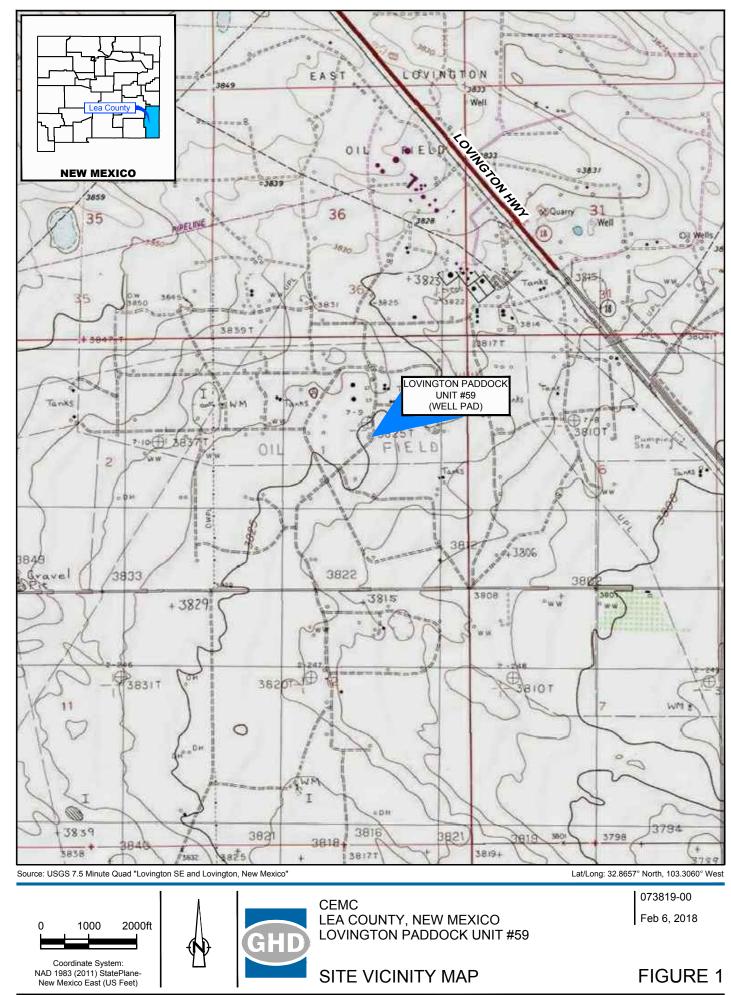

All of Which is Respectfully Submitted,

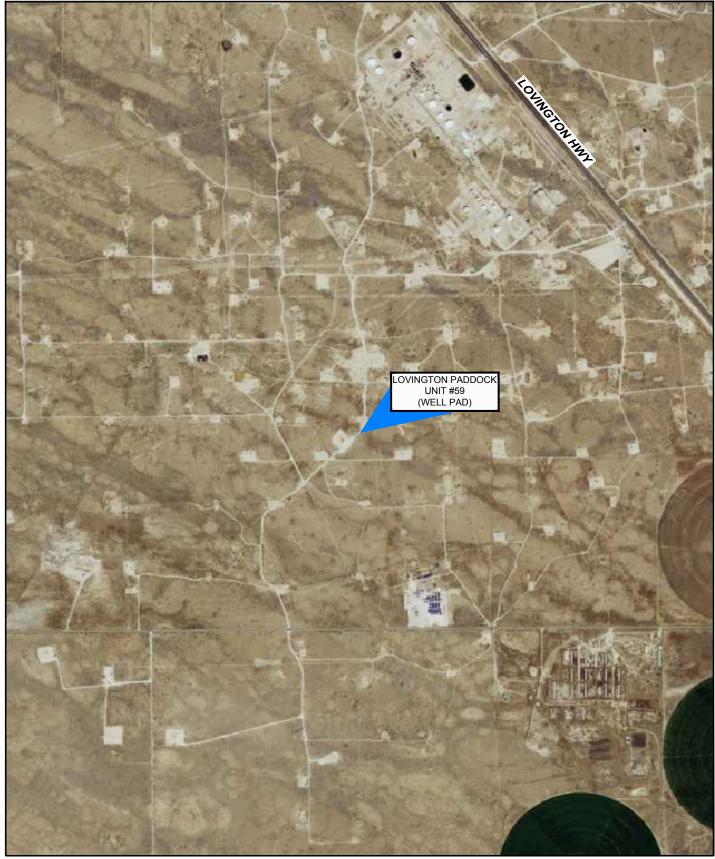

**GHD** 

Paige Hall Project Manager

Raaj U. Patel, P.G.,

#### **Scott Foord:**

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 598441. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 598441 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Debbie Sim

# **Flagging Criteria**

- X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.
- **B** A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.
- **D** The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.
- E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.
- F RPD exceeded lab control limits.
- J The target analyte was positively identified below the quantitation limit and above the detection limit.
- U Analyte was not detected.
- L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.
- **H** The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.
- **K** Sample analyzed outside of recommended hold time.
- **JN** A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

BRL Below Reporting Limit.

### **Scott Foord:**

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 604309. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 604309 will be filed for 45 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Debbie Sin

# **Flagging Criteria**

- X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.
- **B** A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.
- **D** The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.
- E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.
- F RPD exceeded lab control limits.
- J The target analyte was positively identified below the quantitation limit and above the detection limit.
- U Analyte was not detected.
- L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.
- **H** The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.
- **K** Sample analyzed outside of recommended hold time.
- **JN** A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

Appendix C 2019 Remediation Work Plan

March 21, 2019 Reference No. 073819

New Mexico Oil Conservation Division – District 1 1625 N. French Drive Hobbs, New Mexico 88240

Dear NMOCD:

Re: 2019 Remediation Work Plan

Lovington Paddock Unit 59 - Produced Water Release (1RP-915)

Lea County, New Mexico

### 1. Project Information

The Site is located in Unit G, Section 1, Township 17 South, Range 36 East, approximately 5 miles southeast of the City of Lovington (COL) in Lea County, New Mexico. According to historical records provided to GHD, an estimated 40 barrels (10 barrels recovered) of produced water were released from a pipe in a valve box at this location on June 4, 2006. The approximate affected area was estimated at 200 feet x 200 feet.

### 2. NMOCD Closure Requirement Criteria for Soils

Subsurface investigation activities were completed in accordance with the Guidelines for Remediation of Leaks, Spills, and Releases Rule 19.15.29 New Mexico Administrative Code (NMAC) from the NMOCD dated August 13, 1993. The former the site-specific Recommended Remediation Action Levels (RRALs) previously applied to this location by the NMOCD were 10 milligrams per kilogram (mg/kg) for benzene, 50 mg/kg for total benzene, toluene, ethylbenzene, and xylenes (BTEX), 100 mg/kg for petroleum hydrocarbons (TPH), and 600 mg/kg for chloride.

Rule 19.15.29 was revised and reissued on August 14, 2018. The following criteria from Table 1 (below) within NMAC 19.15.29.12 was utilized to determine site-specific screening limits.

Minimum depth below any point within the horizontal boundary of the release to ground water less than 10,000 mg/l TDS	Constituent	Limit**
>100 feet	Chloride***	20,000 mg/kg
	TPH (GRO+DRO+MRO)	2,500 mg/kg
	GRO+DRO	1,000 mg/kg
	BTEX	50 mg/kg
	Benzene	10 mg/kg

<sup>\*\*</sup> Numerical limits or natural background level, whichever is greater.

<sup>\*\*\*</sup> This applies to release of produced water or other fluids which may contain chloride.

Localized depth to groundwater was confirmed to be approximately 107 feet below ground surface (bgs) in 2018 based on the information from monitoring wells MW-1 (located approximately on top of the original spill) and MW-2 (located approximately 120-feet to the southeast of the original spill). Additionally, information available from various sources including the New Mexico Office of the State Engineer (NMOSE) Point of Diversion (POD) Mapping Portal, Petroleum Recovery Research Center (PRRC) Mapping Portal, currently managed groundwater site(s) data by GHD, and the United States Geological Survey (USGS) Current Water Database for the Nation, concludes:

- a) the depth to groundwater at the Site is greater than 100-feet bgs;
- b) the site is not within 300 feet of any continuously flowing watercourse;
- c) the site is not within 200 feet of any lakebed, sinkhole or playa lake;
- d) the site is not within 300 feet of an occupied permanent residence, school, etc.;
- e) the site is not within 500 feet of a spring or private, domestic fresh water well;
- f) the site is not within 1,000 feet of any fresh water well or spring;
- g) the site is not within incorporated municipal boundaries or within a defined municipal fresh water well field;
- h) the site is not within 300 feet of a wetland;
- i) the site is not within an area overlying a subsurface mine:
- i) the site is not within an unstable area; and
- k) the site is not within a 100-year floodplain.

Consequently, the anticipated site-specific screening limits to be applied to this location by the NMOCD based on the revised Rule are 10 mg/kg for benzene, 50 mg/kg for total BTEX, 2,500 mg/kg for total TPH, and 20,000 mg/kg for chloride.

Per 19.15.29.13, Restoration, Reclamation, and Re-vegetation, the impacted area must be remediated a minimum of 4-feet bgs with non-waste containing, uncontaminated, earthen material with chloride concentrations less than 600 mg/kg. Soil cover must consist of topsoil at a thickness comparable to background topsoil thicknesses, or one foot of suitable earthen material capable of establishing and maintaining vegetation at the site. Reclamation is considered complete when all disturbed areas have established vegetative cover with a life-form ratio of plus or minus 50 percent of pre-remedial levels, and plant cover of a minimum of 70 percent of previous levels, excluding noxious weeds.

Evaluation of the analytical data obtained from soil assessment and delineation activities performed from 2010 through 2018 indicate horizontal and vertical delineation of chloride impacts to soil has been achieved at the Site to support remediation activities (excavation and lining of the area).

073819New Mexico -1 2

### 3. 2019 Scope of Work

The scope of work for this project in 2019 will involve soil remediation activities inclusive of excavation, sampling, lining the excavation, backfilling, and restoration (re-seeding of off-pad areas) of the impacted area (see Figure 1).

Chloride impacted caliche well pad material and soil will be excavated accompanied by confirmation soil sample analysis. Field screening of soils for chlorides will be performed in order to guide excavation activities. Subsequently, the excavation will be lined, backfilled with clean caliche material and soil, graded and contoured to ensure proper surface area drainage, and the soil (off-pad areas) fertilized and reseeded. The following outlines basic project details that will be completed by GHD and GHD subcontractors.

### Field Program

- Prior to mobilizing excavation equipment to the Site, a New Mexico 811 utility notification will be made at least 48-hours prior to mobilization.
- In addition to the utility locate, data from the geophysical survey conducted prior to 2018 drilling activities will be re-evaluated for the proposed excavation area.
- Following all utility clearance activities, a Chevron Dig Plan will be prepared and approved by Chevron prior to performing any excavation activities.
- Underground utilities in proximity to the proposed excavation area will be day-lighted via hydroexcavation prior to remedial excavation activities.
- GHD anticipates that pipeline operators will not allow excavation within 10 feet of any pipelines, therefore remediation within these areas will be deferred until operations of the pipelines cease.
- Approximately 560 cubic yards (cy) of shallow sub-surface area consisting of caliche well pad
  materials and off-pad soil areas will be excavated (Figure 1). Impacted soil in the affected area will be
  excavated until field screening indicates that the soil is below the limit for chloride (600 mg/kg)
  specified in NMMAC 19.15.29.13 D (1), or until a depth of 4 feet bgs is reached.
- Soils will be field screened for chloride during excavation activities utilizing Hach chloride test strips.
  Soils with field test results greater than 3,000 mg/kg chloride with be transported to an approved
  disposal facility. If field screening indicates that soils are below 3,000 mg/kg chloride, it will be
  segregated into 50-100 cy stockpiles and a 5-point composite sample will be collected and analyzed
  for chloride by EPA Method 300. Soils with analytical results above 600 mg/kg will be transported to
  the R360 facility located in Hobbs, New Mexico for disposal. Stockpiled soils with analytical results
  below 600 mg/kg will be further consolidated on-site for use as backfill.
- Five-point composite confirmation soil samples will be collected from the excavation floor and sidewalls at 200 square feet intervals for analysis of chloride by EPA Method 300. Lateral limits of the excavation will halt once confirmation sample analytical results are 600 mg/kg chloride or less.

073819New Mexico -1 3

- If impacts appear to extend past four feet bgs, the sides of the excavation will be sloped and a 20-mil
  polyethylene liner will be placed in the bottom of the excavation. Liner seams will be overlapped a
  minimum of 24 inches. Each liner will be placed without rips or tears.
- The excavation will be backfilled with caliche and soil from an off-site borrow pit (Pearce Ranch Trust) to grade.
- The disturbed off-pad area will be fertilized and re-seeded with a Bureau of Land Managementapproved seed mix.

### **Quality Assurance/ Quality Control**

Confirmation soil sampling will be completed in accordance with our standard Quality Assurance/ Quality Control procedures designed to minimize cross-contamination between samples and to provide reliable laboratory results.

### Reporting

A report summarizing remediation activities will be submitted. The report will include a Site description, project history, description of field events, a discussion of results, and recommendations (if any).

The report will include:

- A scaled Site plan showing the locations of the excavation and other Site features;
- · Tabulation of field screening and laboratory analytical results; and
- Geotagged photographic documentation of field activities.

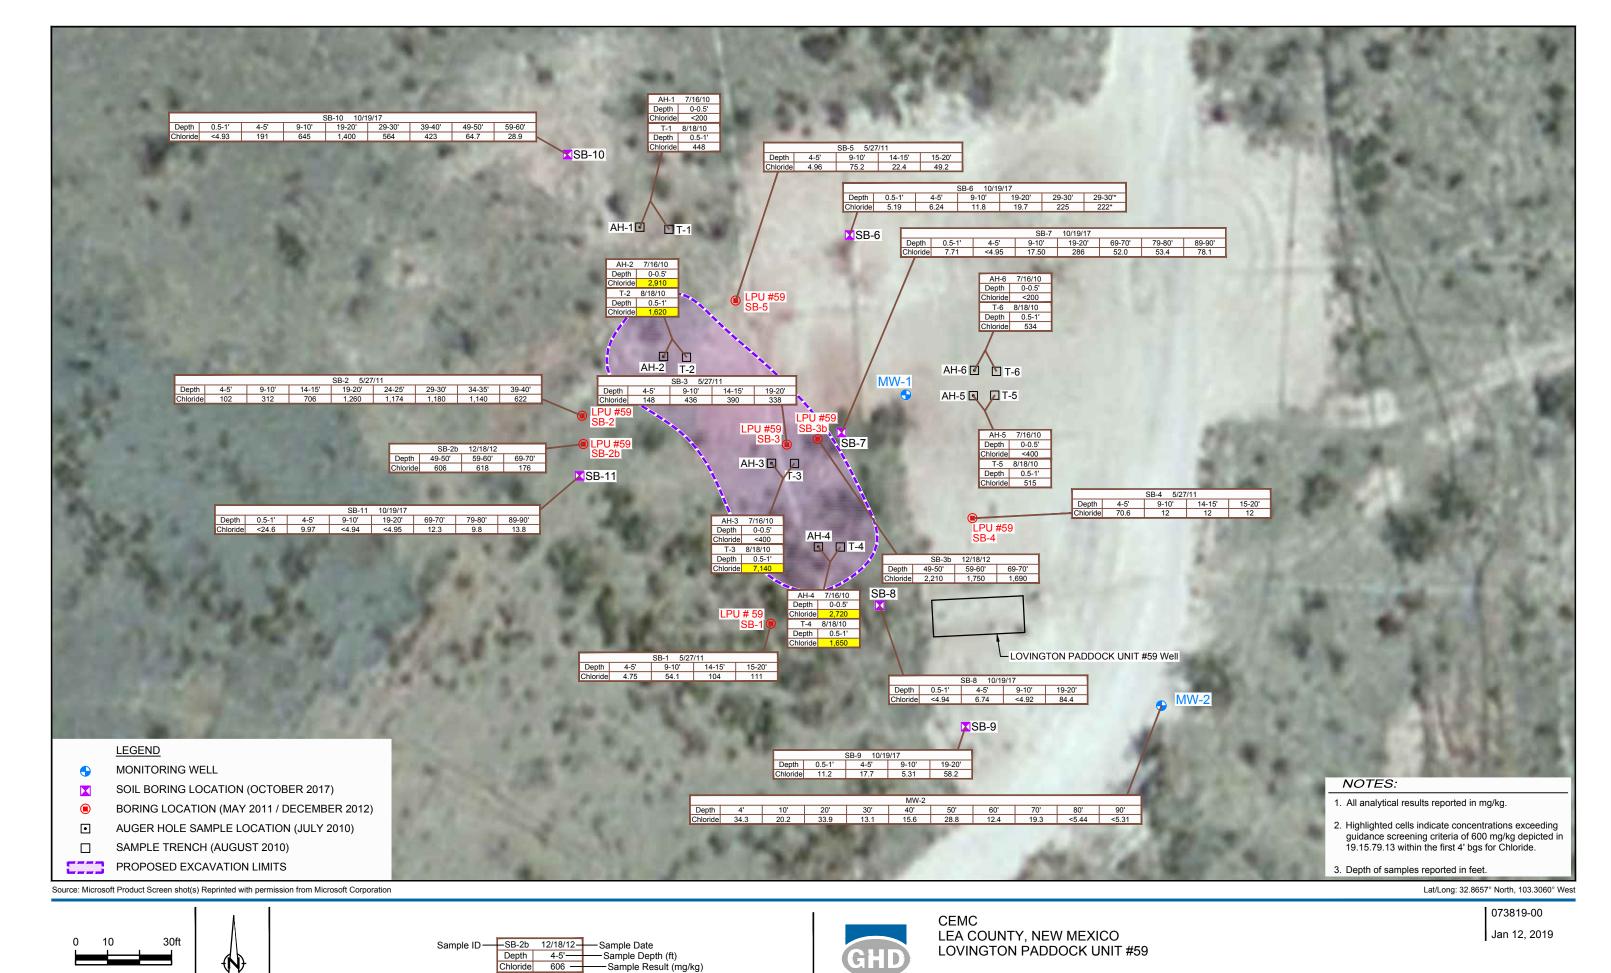

### **Vegetation Monitoring**

Following completion of soil remediation activities at the Site, and as required by the New Mexico State Land Office (NMSLO), GHD will conduct vegetation monitoring visits to the Site. The status of vegetative growth within the remediated area will be documented with photographs and in field notes during each visit. A closure request report will be completed following one year of monitoring for submittal to NMSLO.

### 4. Work Plan Approval Request

GHD is prepared to initiate the scope of work following NMOCD approval of this work plan. If you have any questions or comments with regards to this work plan, please do not hesitate to contact our Houston office at (713) 734-3090. Your timely response to this correspondence is appreciated.
