NATURE OF RELEASE

Type of Release Produced water and oil	Volume of Release 20 bbls	Volume Recovered 15 bbls
Source of Release Well head	Date and Hour of Occurrence Unknown	Date and Hour of Discovery 6/30/14 7:30 am
Was Immediate Notice Given? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Not Required	If YES, To Whom?	
By Whom?	Date and Hour	
Was a Watercourse Reached? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No	If YES, Volume Impacting the Watercourse.	

If a Watercourse was Impacted, Describe Fully.*

Describe Cause of Problem and Remedial Action Taken.* ☐ The threads on the 5 1/2 in casing pin failed releasing 20 bbls of produced water and oil.

Describe Area Affected and Cleanup Action Taken.* ☐ A total of 7,132 sq ft of lease pad and pasture land was affected by the release. A vacuum truck was called to the site and recovered 15 bbls of fluid. RECS personnel were on site beginning on July 7th, 2014, to assess the release. Five points within the release area were field sampled at the surface, and four of the points were sampled with depth. Representative samples were taken to a commercial laboratory for analysis. Based on the sampling data, a CAP was submitted to NMOCD and BLM on August 19th, 2014. NMOCD approved the CAP on August 20th, 2014, with the stipulation that horizontal confirmation samples be taken from either the side walls or outside the excavation area. Corrective actions began at the site on October 15th, 2014. The release on the lease pad was excavated in 5 parts. Once each scrape was completed, final wall and bottom samples were taken and field tested for chlorides and organic vapors. The samples were then taken to a commercial laboratory for analysis. The southernmost 6 inch bgs scrape, located around Point 5, returned an elevated chloride concentration for the 5 point bottom composite. Therefore, the scrape was deepened to 9 inches bgs, and another 5 point bottom composite was taken. The 5 point bottom composite at 9 inches bgs returned an acceptable chloride value of 32 mg/kg. A request to backfill the site was sent to NMOCD and BLM on October 31st, 2014. NMOCD approved the site to be backfilled on November 3rd, 2014, and BLM approved the site to be backfilled on November 13th, 2014. All excavated soil was taken to a NMOCD approved facility for disposal. Clean caliche was imported to the site to serve as backfill. A sample of the caliche was taken to a commercial laboratory for analysis and returned a chloride value of 176 mg/kg. The scrapes were backfilled with the imported caliche and contoured to the surrounding location. The vegetation that was affected by the release was sprayed with Micro-Blaze on November 10th, 2014. This washed vegetation will be monitored for continued health.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.
