Eddy County, New Mexico**

**RECEIVED
DEC 26 2003
OCD-ARTESIA**

There are no houses within a 1 mile radius of this well. The closest public access road is over one mile away. No known H2S has been observed within 2 miles of this wellbore.

No H2S is expected to be encountered during the workover operations on this well. The well bore is cased with 5.5" casing from surface to TD. All operations will be conducted inside the wellbore. A 5M Hyd BOP will be utilized and installed at the onset of operations. A CIBP will be placed over the Atoka perforations. No H2S was detected in the Atoka or other formations penetrated while drilling and casing the well bore.

The Wolfcamp formation normally does not contain any H2S in the South Carlsbad area. All BOP's will be tested daily. All H2S monitors will be tested daily.

All precautions will be taken while re-completing this well to the Wolfcamp. A compliance package will be set up on location for the detection of H2S. All personnel will be H2S certified and monitors will be used and tested daily for the detection of H2S. All personnel will wear personal H2S Monitors.

A list of all pertinent telephone numbers will be placed in the dog house of the workover rig for contacting emergency personnel in case an H2S emergency is encountered. There is another access road to the East away from the well site in case of an emergency or evacuation.
