JAN 20 2011

Attention: Oil & Gas Operators of Federal Leases within the Pecos District of New Mexico

This letter represents written notice that external gauging devices will not be allowed on any liquid hydrocarbon storage tanks and/or storage facilities containing federal minerals. The operator and/or responsible party will have the devices removed, and any penetrations to the tank that jeopardize tank integrity shall be repaired. This policy is effective immediately.

Due to inspections on Federal leases involving storage facilities w/ external gauging devices and after extensive research and consideration, the Bureau of Land Management's Pecos District has concluded that external gauging devices do not meet 43 CFR 3162.1(a) & Onshore Oil and Gas Order #4.IH.C.

43 CFR 3162.1 General requirements.

(a) The operating rights owner or operator, as appropriate, shall comply with applicable laws and regulations; with the lease terms, Onshore Oil and Gas Orders, NTL's; and with other orders and instructions of the authorized officer. These include, but are not limited to, conducting all operations in a manner which ensures the proper handling, measurement, disposition, and site security of leasehold production; which protects other natural resources and environmental quality; which protects life and property; and which results in maximum ultimate economic recovery of oil and gas with minimum waste and with minimum adverse effect on ultimate recovery of other mineral resources.

Onshore Oil and Gas Order #4.III.C Oil Measurement by Tank Gauging:

Oil measurement by tank gauging shall accurately compute the volume of oil withdrawn from a properly calibrated sales tank by measuring the height of the oil level in the tank before delivery (opening gauge) and then measuring the height of the oil level in the tank after delivery (closing gauge). The opening and closing gauges are then used with the tank calibration charts (tank tables) to compute accurately the volume of oil withdrawn. Gauging may be accomplished by measuring the height of the oil level from the tank bottom or a fixed datum plate upward to the surface of the oil in the tank (image gauging) or by measuring from a fixed reference point at the top of the tank downward to the surface of the oil in the tank (outage gauging). Samples shall be taken from the oil before gauging to determine API gravity and sediment and water content. Prior to gauging, the temperature of the oil shall be determined from measurements made in the tank. The measured oil volume shall then be corrected for sediment and water content, and to the standard sales temperature of 60 F.

The following requirements and minimum standards shall be accomplished in accordance with API Standard 2545 (ANSI/ASTM D-1085), "Method of Gauging Petroleum and Products," 1965, reaffirmed in 1987, and (ANSI/ASTM D-1250), Tables 5A and 6A.

Onshore Oil and Gas Order #4.III.C.1 Sales Tank Equipment:

Each oil storage tank to be used for oil sales by tank gauging shall be properly equipped for such gauging, using the "API Recommended Practice for Setting Connecting, Maintenance, and Operation of

Lease Tanks, API RP 12 RI,"1986. Tanks shall also be connected, maintained, and operated so as to comply with the Site Security Regulations, 43 CFR 3162.7-5, and Onshore Oil and Gas Order No. 3 and sales tanks shall meet the following requirements Onshore Oil & Gas Order #4.III.C.1. (a)(b)(c).

Any Federal Lease found to have external gauging devices shall deem it necessary for the Bureau of Land Management's Pecos District to issue a Major Violation Notice Of Incidents Of Noncompliance (Form 3160-9).
