

Barney Cockburn  
No. 1 Willis Berry

Page 2.

Fair to good porosity with good oil stain was present in the samples of dolomite between 2159 and 2176 feet, measurements corrected, while some slight porosity and slight to fair oil staining was present in the dolomite samples between 2176 and 2193 feet. This section indicated that a small well might be completed between 2159 and 2193 feet.

The only other evidence of oil staining in the dolomite was some slight to fair oil stain between 2198 and 2205 feet which did not appear to indicate commercial production.

Yours very truly,

But to good porosity with good oil stain was present in the samples of dolomite between 2159 and 2170 feet, measurements corrected, while some slight porosity and slight oil stain was present in the dolomite samples between 2170 and 2193 feet. This section indicated that a small well might be completed between 2159 and 2193 feet.

The only other evidence of oil staining in the dolomite was some slight oil stain between 2193 and 2202 feet which did not appear to indicate commercial production.

Yours very truly,
