Abstract—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders among different types of workers. The subjects included all employees of a large manufacturing company who had been employed at least one year. A questionnaire was mailed to each employee asking about symptoms of musculoskeletal disorders and work-related factors. The response rate was 70%. The results showed that the prevalence of musculoskeletal disorders was higher among non-manual workers than manual workers. The prevalence of musculoskeletal disorders was also higher among those working in the production department than those working in other departments. The prevalence of musculoskeletal disorders was also higher among those working in the production department than those working in other departments. The prevalence of musculoskeletal disorders was also higher among those working in the production department than those working in other departments.
