(County or Subdivision)

New Mexico
(State or Territory)The elevation of the derrick floor above sea level is _____ ft. **Will report later.**

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate casing joints, cementing points, and all other important proposed work)

We propose to drill on the above captioned location to approximately 2000 feet and complete this well in the Penrose sand. If production is not obtained in the Penrose sand we will drill to the San Andres lime. We will run 8 5/8" surface casing to approximately 425' and cement with 50 sacks neat cement; run 1800' of 7" casing to shut off red sand water; run 5 1/2" 14 lbs. per ft. new seamless casing to approximately 1950' for production string and cement with 100 sacks cement. We will pull 7" before cementing 5 1/2" casing.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
