Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was exposed to a control environment (CE) and the EG was exposed to an experimental environment (EE). The EE was designed to simulate a real-world environment with various stimuli (e.g., traffic, noise, and visual clutter). The subjects were then exposed to a test environment (TE) and their performance was measured. The results showed that the EG performed significantly better than the CG in the TE.

1. *Staphylococcus aureus* (10<sup>6</sup> CFU/ml)
