Gentlemen:

I have shown the completion date for the referenced well as 5/02/97 on the various filings. This is the date after the electricity and the required pumping unit was installed and the well was turned down the flowline to the tank battery. The April 1997 production reports show that 297 bbls of oil was moved from the 500 bbl frac tank that was on the location to the tank battery. This accumulated production was the result of the well being left open to the tank but not able to sustain any consistent rate of flow from 4/10/97 until all equipment was in place for the well. We do not believe this well was ready to produce until 5/02/97 but recognize that this may present a conflict for your records. After my phone conversation with Mr. David Glass it was decided that the best action would be this letter.

Please advise if you have any questions or comments.

Yours truly,

James H. Arline
Materials Coordinator
