The elevation of the derrick floor above sea level is 3579' ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Plan to deepen well from present T.D. (2883') to approx. 3120' or thru the Premier sand. We will run a Halliburton drillable packer on 2" tubing and set in line immediately above the Premier sand and Mgt Hydrafracs with 1500 gallons. If the Premier sand makes a commercial well we will leave the packer in well and produce through the 2" tubing. This well is making approx. 4 bbls. oil and no water in the Loco sand at the present time. If the premier sand does not make a commercial well we will plug back and produce the loco.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
